Till a Speaker be elected, the clerk acts as Speaker, standing and pointing to members as they rise to speak, and then sitting down. If only one candidate be proposed for the office, the motion, after being seconded, is supported by an influential member, generally the leader of the House of Commons; and the member proposed, having expressed his sense of the honour meant to be conferred on him, is called by the House to the chair, to which he is led by his proposer and seconder. If another member be proposed and seconded, a debate ensues; and at its close, the clerk puts the question, that the member first proposed ‘do take the chair of the House as Speaker.’ If the House divide, he directs one party to go into the right lobby, and the other into the left, and appoints two tellers for each. If the majority be in favour of the member first proposed, he is led to the chair; if not, a similar question being put regarding the other member and answered in the affirmative, he is conducted to the chair. The Speaker-elect expresses his thanks for the honour conferred on him, and takes his seat; on which, the mace is laid on the table, where it is always placed during the sitting of the House with

the Speaker in the chair. He is then congratulated by some leading member, and the House adjourns. The next day, the Speaker-elect, on the arrival of Black Rod, proceeds with the Commons to the House of Lords, where his election is approved by the Lord Chancellor. He then lays claim, on behalf of the Commons, to their ancient rights and privileges, which, being confirmed, he retires with the Commons from the bar. Nearly the same forms are observed on the election of a new Speaker, when a vacancy occurs by death or resignation in the course of the session.

The members of both Houses then take the oath prescribed by law, a proceeding which occupies several days. See OATH; ABJURATION. In the Upper House, the Lord Chancellor first takes the oath singly at the table. The Clerk of the Crown delivers a certificate of the return of the Scottish representative peers, and Garter King-at-arms the roll of the lords temporal, after which the lords present take and subscribe the oath. Peers who have been newly created by letters-patent present their patents to the Lord Chancellor, are introduced in their robes between two other peers of their own dignity, preceded by Black Rod and Garter, and conducted to their places. The same ceremony is observed in the case of peers who have received a writ of summons—a formality necessary when a member of the Lower House succeeds to a peerage; otherwise, his seat does not become vacant. A bishop is introduced by two other bishops, without the formalities observed with temporal lords. Representative bishops of Ireland take their seats without any particular ceremony. Peers by descent have a right to take their seats without introduction; peers by special limitation in remainder have to be introduced. In the Commons, the Speaker first subscribes the oath, standing on the upper step of the chair, and is followed by the other members. Members on taking the oath are introduced by the Clerk of the House to the Speaker. Members returned on new writs in the course of the session, after taking the oath, are introduced between two members. They must bring a certificate of their return from the Clerk of the Crown. The oaths are required to be taken in a full House, with the Speaker in the chair—in the Commons, between the hours of nine and four. The presence of a Commission constitutes a full House. In the Upper House, the oaths may, by 6 and 7 Vict. c. 6, be taken till 5 o’clock. On the demise of the crown, the oaths must be taken anew in both Houses.

When the greater part of the members of both Houses have been sworn, the causes of calling the parliament are declared by the sovereign either in person or by commission. In the former case, the Queen proceeds in state to the House of Lords, and commands Black Rod to let the Commons know ‘that it is her Majesty’s pleasure that they attend her immediately in this House.’ Black Rod proceeds to the House of Commons, and formally commands their attendance, on which the Speaker and the Commons go up to the bar of the House of Lords, and the queen reads her speech, which is delivered to her by the Lord Chancellor kneeling on one knee. When parliament is opened by commission, the sovereign not being personally present, the Lord Chancellor reads the royal speech to both Houses. Immediately after the royal speech is read, the House is adjourned during pleasure; but both Houses are resumed in the afternoon, for the purpose of voting an address in answer to the speech from the throne. In each House, it is common to begin business by reading some bill *pro forma*, in order to assert the right of deliberating without

reference to the immediate cause of summons. The royal speech is then read, and an address moved in answer to it. Two members in each House are chosen by the ministry to move and second the address. The preparation of the address is referred to a select committee; it is twice read, may be amended, and when finally agreed on, it is ordered to be presented to her Majesty.

Adjournment, Prorogation, and Dissolution.—Adjournment of parliament is but the continuance of the session from one day to another. Either House may adjourn separately on its own authority, with this restriction, introduced by Act 39 and 40 Geo. III. c. 14, that the sovereign, with advice of the privy council, may issue a proclamation appointing parliament to meet within not less than 14 days, notwithstanding an adjournment beyond that period. On reassembling, the House can again take up business which was left unfinished. A prorogation differs from an adjournment in this respect, that it not merely suspends all business, but quashes all proceedings pending at the time, except impeachments by the Commons, and Appeals and Writs of Error in the Lords. William III. prorogued parliament from 21st October to 23d October 1689, in order to renew the Bill of Rights, regarding which a difference had arisen between the two Houses that was fatal to its progress. It being a rule that a bill of the same substance cannot be introduced twice in the same session, a prorogation has sometimes been resorted to, to enable a second bill to be brought in. Parliament can only be prorogued, as already mentioned, by the sovereign; the royal authority is signified either by the Lord Chancellor, or by writ under the great seal, or by a commission from the crown. When parliament stands prorogued to a certain day, the sovereign is empowered by 37 Geo. III. c. 127 to issue a proclamation, giving notice that parliament is to meet on some other day, not less than 14 days distant, to which day parliament then stands prorogued. At the beginning of a new parliament, when it is not intended that it should meet for the despatch of business, it is usually prorogued by a writ of prorogation read by the Lord Chancellor in the House of Lords. A proclamation is issued prior to the prorogation; and when it is intended that parliament shall meet on the day to which it is prorogued for the despatch of business, the proclamation states that parliament will then 'assemble and be holden for the despatch of divers urgent and important affairs.'

Parliament comes to an end by Dissolution, which is its civil death. This dissolution may be by the will of the sovereign, expressed in person or by her representatives. Having been first prorogued, it is dissolved by a royal proclamation under the great seal, and by the same instrument it is declared that the chancellor of Great Britain and chancellor of Ireland have been respectively ordered to issue out writs for calling a new parliament. These writs are immediately issued, and the period to be fixed by the crown for the assembling of the new parliament, formerly 40 days, was by 7 and 8 William IV. reduced to 35 days. At common law, parliament is *ipso facto* dissolved by the demise of the crown; but, by Act 6 Anne, c. 7, it is continued for six months after the demise, unless sooner dissolved by the successor. The same act requires parliament to assemble immediately on the demise of the crown, notwithstanding adjournment or prorogation; and it is provided that in case no parliament is in being at that time, the last preceding parliament shall meet and be a parliament. By Act 37 Geo. III. c. 127, a parliament so revived continues in existence only for six months, if not sooner dissolved. Were the power of

dissolving the parliament not vested in the executive, there would be a danger of its becoming permanent, and encroaching on the royal authority, so as to destroy the balance of the constitution. An example of this danger is shewn in the Long Parliament, to which Charles I. conceded that it should not be dissolved till such time as it dissolved itself. If the Houses of Parliament encroach on the executive, or act factiously or injudiciously, the crown may, by a dissolution, bring their proceedings to an end, and appeal to the people by sending the members of the House of Commons to give an account of their conduct to their constituents.

There was originally no limit to the duration of a parliament except the will of the sovereign. By 6 Will. and Mary, c. 2, the continuance of a parliament was limited to three years, a term afterwards extended by 1 Geo. I. c. 38, to seven years. The same act of William and Mary enacts that parliament shall assemble once in three years at the least; but the practice of granting the Mutiny Act and the Budget for a year only, makes it necessary that it should assemble annually.

Conduct of Business.—Each House is presided over by its Speaker. The Speaker of the House of Commons does not take part in a debate, offer his opinion, or vote on ordinary occasions; but, in case of equality, he has a casting vote: his duty is to decide all questions which relate to order, putting the matter at issue in a substantive form for the decision of the House, if his own decision is not assented to. He explains any doubts that may arise on bills. He determines the precedence of members rising to address the House. He examines witnesses at the bar. At the close of the session, he addresses the sovereign on presenting the money-bills passed during the session for the royal assent. He nominates the tellers on a division, and makes known the votes to the House. He may commit members to custody during the pleasure of the House, a confinement which terminates with the close of the session. When a vacancy occurs by death, he signs the warrant to the Clerk of the Crown to make out the writ for the election of a new member. He audits the accounts of the receiver of fees, and directs the printing of the votes and proceedings of the House. The Lord Chancellor, or Lord Keeper of the Great Seal, is the Speaker of the House of Lords; in his absence, the Chairman of the Committee of Ways and Means takes the chair. The Speaker is not, as in the Lower House, charged with the maintenance of order, or the decision who is to be heard, which rest with the House itself. The Chairman of the Committee of Ways and Means of the House of Commons as Deputy-speaker, performs the Speaker's duties in his absence. The chief officers of the House of Lords are the Clerk of the Parliaments, who takes minutes of the proceedings of the House; the Gentleman Usher of the Black Rod, who, with his deputy, the Yeoman Usher, is sent to desire the attendance of the Commons, executes orders for committal, and assists in various ceremonies; the Clerk-assistant; and the Sergeant-at-arms, who attends the Lord Chancellor with the mace, and executes the orders of the House for the attachment of delinquents. The chief officers of the Commons are the Clerk of the House, the Sergeant-at-arms, the Clerk-assistant, and Second Clerk-assistant.

Each House has its *Standing Orders*, or regulations, adopted at different periods, relating partly to internal order, partly to certain preliminaries required in the introduction of bills and promulgation of statutes. A standing order endures till repealed (or 'vacated,' as it is called in the Upper House); but each House is also in the practice of agreeing to certain orders or *resolutions* of uncertain

duration declaratory of its practice, which are considered less formally binding than standing orders.

The House of Lords usually meets at 5 P.M.; the Commons at a quarter before 4, except on Wednesdays and some other days specially appointed, when the hours of sitting are from 12 to 6. In the Lords, the Chancellor, as Speaker, sits on the woolsack. A standing order, which is never enforced, requires the Lords to take place according to precedence. Practically, the bishops sit together on the right hand of the throne; the members of the administration on the front bench on the right hand of the woolsack adjoining the bishops, and the peers who usually vote with them occupy the other benches on that side. The peers in opposition are ranged on the opposite side, and those considered politically neutral occupy the cross benches between the table and the bar. In the House of Commons, the front bench on the right hand of the chair is reserved for the ministry, and called the Treasury Bench, the front bench on the opposite side being occupied by the leaders of the opposition. By ancient custom and orders of both Houses, rarely enforced, strangers are excluded while the Houses are sitting.

Prayers are read before business is begun—in the House of Lords by a bishop; in the House of Commons by the chaplain. Every member is bound to attend the House—in the Lower House, personally; in the Upper personally, or by proxy; but in ordinary circumstances, this obligation is not enforced. The House of Lords may proceed to business when three peers are present; in the Commons, forty members are required to constitute a House for the despatch of business. The Speaker counts the House at four; and if that number be not then present, or if it be noticed, or appear on a division, that fewer than forty members are present, the House is adjourned. A call of the House is an expedient to secure attendance on important occasions; when it is made, members absent without leave may be ordered to be taken into custody. When matters of great interest are to be debated in the Upper House, the Lords are 'summoned.'

To make a motion, or, more properly, to move the House, is to propose a question, and notices of motions should be given on a previous day. The Commons are in the practice of setting apart Mondays, Wednesdays, Thursdays, and Fridays for considering orders of the day, or matters which the House had already agreed to consider on a particular day, and to reserve Tuesdays for motions. Government orders take precedence of others on all order days except Wednesdays, which are generally reserved for the orders of independent members. Notices of motions are by a standing order not allowed to be given for any period beyond the four days next following on which motions are entitled to precedence. Questions of privilege may be considered without previous notices, and take precedence both of other motions and orders of the day. A motion may be accompanied by a speech, and must in the Lower House be seconded, otherwise there is no question before the House. In purely formal motions this rule is not observed, and an order of the day may be moved without a seconder. A seconder is not required in the House of Lords. A motion in the Commons must be reduced to writing by the mover, and delivered to the Speaker, who, when it has been seconded, puts it to the House; it cannot then be withdrawn without leave of the House. In the Lords, when a motion has been made, a question is proposed 'that the motion be agreed to.' When an amendment is proposed to a question, the original motion cannot be withdrawn till the amendment has been either withdrawn or negatived.

An amendment is properly such an alteration on a motion by striking out or adding words, or both, as may enable members to vote for it who would not have done so otherwise.

A question may be evaded or superseded in four ways: 1. By adjournment. Any member in possession of the House may move 'that the House do now adjourn.' The House may also be adjourned, even while a member is speaking, on its being noticed that there are fewer than forty members present. The motion, 'that the debate be now adjourned,' does not supersede the question, but merely defers the decision of the House. 2. By a motion, that the orders of the day be now read, which may be put and carried on days on which notices of motion have precedence. 3. By what is called *moving the previous question*. The act of the Speaker in putting the question is intercepted by a motion, 'that the question be now put.' The mover and seconder of this motion vote against it; and if it be resolved in the negative, the Speaker is prevented from putting the main question, which, however, may be brought forward on another day. 4. By an amendment substituting words of an entirely different import for those of the motion, so that the sense of the House is taken on a totally different question.

When the question is put by the Speaker in the Lords, the respective parties exclaim 'content' or 'non-content'; in the Commons, the expression used is 'aye' or 'no.' The Speaker signifies his opinion which party have the majority, and if the House acquiesce, the question is said to be resolved in the affirmative or negative; when his decision is disputed, the numbers must be counted by a division. Both Houses now divide by the content or ayes going into the right lobby, and the non-contents or noes into the left, each being counted by tellers appointed by the Speaker. In the House of Commons, two clerks with printed lists of the members put a mark to the name of each as he re-enters the House, so as to secure accuracy in the division lists. The Speaker of the Commons, who does not otherwise vote or take part in a debate, has a casting-vote in case of equality. In the House of Lords, the Speaker is, on the other hand, not disqualified from taking part in a debate; he votes on divisions, but has no casting vote; and on an equality, the non-contents prevail. The system of pairing commonly practised, though never directly recognised by the House, enables members on opposite sides to absent themselves for a time agreed on, each neutralising the votes of the other. A member of the Upper House may, with leave of the House, by a protest enter his dissent from a vote of the House, and its grounds. Every protest is entered on the Journals of the House, together with the names of all the lords who concur in it.

No question or bill is allowed to be offered in either House substantially the same with one on which the judgment of that House has already been expressed in the current session. A resolution of the House, however, may be rescinded, and an order discharged; and by 13 and 14 Vict. c. 21, it is provided that every act may be altered, amended, or repealed in the same session of parliament.

In debate, a member of the Commons addresses the Speaker; a member of the Upper House the lords generally, in both cases standing and uncovered. No member may speak except when there is a question before the House, or with the view to propose a motion or amendment, the only admitted exceptions being in putting questions to ministers of the crown, or to members concerned in some business which is before the House, and in explaining personal matters. A member is not

allowed to speak twice to the same question except in explanation, and the proposer, in some cases, in reply—a restriction which does not apply in committee. By the rules adopted by both Houses for preserving order in debate, no allusion is allowed to debates of the same session on a question not under discussion, or to debates in the other House of Parliament. All reflections on any determination of the House are prohibited, except when made with a view of moving that the determination be rescinded; so is the mention by a member of her Majesty's name either irreverently, or to influence the debate, and the use of offensive and insulting words against parliament or either House, or a member of the House in which he is speaking. No member is allowed to refer to another by name, or otherwise than by the rank or office which he enjoys, or place which he represents. The Speaker naming a member to the House, is an old established form of censure, which was last used when Mr Feargus O'Connor struck the member beside him.

Messages.—It is often found necessary for the Houses to communicate with each other regarding matters occurring in the course of business. Messages from the Lords were formerly sent by Masters in Chancery or judges, while the Commons sent a deputation of their own members. According to a new arrangement adopted in 1855, one of the clerks of either House may be the bearer of a message.

Committees.—Parliamentary committees are either 'of the whole House,' or 'select.' A committee of the whole House is the House itself, with a chairman instead of the Speaker presiding. The chair is taken in the Lords by the chairman of committees appointed at the beginning of each session, in the Commons by the chairman of the Committee of Ways and Means. Matters relating to religion, trade, the imposition of taxes, or the granting of public money, are generally considered in committee before legislation, as also are the provisions of any public bill. Proceedings are conducted nearly as when the House is sitting, the Lords being addressed in the Upper House, and in the Lower the chairman, who has the same powers to maintain order as the Speaker, and a casting vote in case of equality. In committees of the Commons, as in the House itself, a quorum of forty members is required; but if that number are not present, the Speaker must resume the chair to adjourn the House. A motion in committee need not be seconded, and there is a more unlimited power of debate than in the House, members being at liberty to speak any number of times on the same question. A motion for 'the previous question' is not allowed. When the business of the committee is not concluded on the day of sitting, the House is resumed, and the chairman moves 'that the House be again put into committee on a future day,' in the Lords, and in the Commons reports progress, and asks leave to sit again.

Select committees are composed of a limited number of members appointed to inquire into any matter, and report. In the Commons, it is usual to give select committees power to send for persons, papers, and records; in the Lords, they may, without any special authority, summon witnesses. In neither House can a committee enforce the attendance of a witness; this must be done, when necessary, by the House itself. The Commons have certain standing orders for insuring the efficiency of committees, and impartiality in their appointment. No committee is to consist of more than fifteen. Members moving for a committee must ascertain whether the members whom they propose to name will attend. Lists of the members serving on each committee are to be affixed in the committee

clerk's office and the lobby. To every question asked of a witness, the name of the member who asks it is to be prefixed in the minutes of evidence laid before the House; and the names of the members present at each sitting, and, in the event of a division, the question proposed, the name of the proposer, and the votes of each member, are to be entered on the minutes, and reported to the House. In the Lords there are no special rules regarding the appointment and constitution of committees; but resolutions containing arrangements similar to those of the Commons regarding questions to witnesses, minutes of proceedings, and divisions, have been adopted since 1852. Select committees have the power of adjournment from time to time, and sometimes from place to place. By an anomaly not easily explained, the Commons have always been considered not to have the power of administering oaths; a power of examining on oath has, however, by statute been granted to election committees, and committees on private bills. In the House of Lords, witnesses had formerly to be sworn at the bar of the House; but the oath may, in terms of a recent act (21 and 22 Vict. c. 78), be administered by any committee of the House. Except where leave of absence has been obtained, no member can excuse himself from serving on committees to which he may have been appointed, or for not attending when his attendance has been made compulsory by order of the House. In committees on private bills in the Commons, the chairman has a deliberative as well as a casting vote.

Bills.—The principal business which occupies both Houses is the passing of bills. In early times, laws were enacted in the form of petitions from the Commons, which were entered on the Rolls of Parliament, with the king's answers subjoined; and at the close of the session, these imperfect records were drawn up in the form of a statute, which was entered on the Statute Rolls. It was found that, on undergoing this process, the acts passed by the parliament were often both added to and mutilated, and much of the legislative power practically came into the hands of the judges. Bills in the form of complete statutes were first introduced in the reign of Henry VI. Bills are either public or private; the former affect the general interests of the community, the latter relate to local matters. Public bills are introduced directly by members; private bills by petitions from the parties interested, presented by members. Bills may originate in either House; but the exclusive right of the Commons to deal with all legislation regarding taxes or supplies, makes it necessary and expedient that by far the greater part of both public and private bills, except such as are of a purely personal nature, should originate in the Lower House. Bills regarding restitution of honours originate in the House of Lords. One description of act alone originates with the crown—an act of grace or pardon. It is read only once in each House, and cannot be amended, but must be accepted in the form in which it is received from the crown, or rejected.

Public Bills.—In the House of Lords, any member may present a bill. In the Commons, any member may move for leave to bring in a bill, except it be for imposing a tax, when an order of the House is required. When the motion is seconded, and leave given, the mover and seconder are ordered to prepare and bring in the bill. Such bills, however, as relate to religion, trade, grants of public money, or taxation, are required to be introduced by the House itself, on the report of a committee of the whole House. A bill is drawn out on paper, with blanks or italics where any part is doubtful, or

where sums have to be inserted. It is read a first time, and a day fixed for a second reading, allowing a sufficient interval to let it be printed and circulated. When ready, which is often as soon as the motion for leave to bring it in has been agreed to, it is presented at the bar by one of the members who were ordered to prepare and bring it in, and afterwards, on an intimation from the Speaker, brought up to the table. The question is put, 'That the bill be now read a first time,' which is rarely objected to; and in the Commons can only be opposed by a division. The short title of the bill, as entered in the orders of the day and endorsed on the bill, is then read aloud, which is accounted sufficient compliance with the order of the House. A day is then appointed for considering the question, 'that the bill be read a second time,' allowing a sufficient interval to elapse to let it be printed and circulated. At the second reading, the member in charge of the bill moves 'that the bill be now read a second time.' This is the usual time for opposing a bill whose general principle is disapproved. This is done by an amendment to the question, by leaving out the word 'now,' and adding 'this day three months,' 'this day six months,' or some other time beyond the probable duration of the session. Counsel are sometimes allowed to plead at the second reading or other stages. If the bill be approved on the second reading, it is committed, either to a select committee, or to a committee of the whole House, to consider its provisions in detail. When the proceedings in committee are terminated, the bill is reported to the House with amendments, which may be agreed to, amended, or disagreed to. It is then ordered to be read a third time, when the entire measure is reviewed. No amendments, except what are verbal, can then be made, and the question is put to the House, 'That this bill do now pass.' The title of the bill is last settled. The bill, when passed by the Commons, is sent to the Lords, where it goes through the same forms: if rejected, no further notice is taken of it; if passed, a message is sent to the Commons that the bill is agreed to. If amendments have been made, they are sent down along with the bill to be discussed by the Commons; and if they are not agreed to, a conference is demanded by the Commons, to offer reasons for disagreeing to the amendments. A conference is a mode of communicating on important matters between the Houses, in which each House is brought into direct contact with the other by a deputation of its own members—the time and place of meeting being always fixed by the Lords. A conference is conducted, for both Houses, by managers, who, on the part of the House desiring the conference (in the case supposed, the Commons), consist of the members who have drawn up the reasons, with others sometimes added. If the Lords be not satisfied with the reasons offered, a second conference is desired, after which what is called a 'free conference' may be demanded, in which the managers have more discretion vested in them to advance what arguments they please. No free conference has been held since 1740. By resolutions of both Houses, agreed to in 1851, reasons for disagreement from amendments may be communicated by messages without a conference, unless the other House should desire a conference; and since that time, there has been but one instance of a conference where a message would have been available. If the Commons eventually agree to the amendments, the bill is sent back to the Lords; if not, it is dropped. The same forms are gone through when a bill originates in the House of Lords. The official record of the assent of one House to the bills passed,

or amendments made by the other, is an endorsement on the bill in Norman French. Thus, when a bill is passed by the Commons, the Clerk of the House writes on the top of it, 'Soit baillé aux seigneurs.' When the Lords make amendment to a bill, it is returned with the endorsement, 'A ceste bille avesque des amendments les seigneurs sont assensus.' When it is sent back with these amendments agreed to, the Clerk of the House of Commons writes, 'A ces amendments les Communes sont assensus.' When both Houses have agreed to a bill, it is deposited in the House of Lords, to await the royal assent, unless it be a money-bill, which is sent back to the Commons.

Private Bills.—In private bills, the functions of parliament partake of the judicial as well as the legislative character, and the difficulties in reconciling the interests of the public and of individuals, often give rise to inquiries too extensive for the House to undertake, which therefore delegates them to committees. The standing orders require certain notices to be given to parties interested by personal service, and to the public by advertisement. The practice in both Houses now is for all petitions for private bills to be referred to four 'examiners,' two from the Lords and two from the Commons, whose duty it is to examine whether certain notices and other forms required by the standing orders of the House have been complied with. If the report be favourable, leave is given to bring in the bill; if unfavourable, it is referred to a committee, called the Committee on Standing Orders, who report on the propriety of relaxing the standing orders in this individual case—should they report unfavourably, it is still in the power of the House to relax the standing orders, though this is rarely done. Three days must elapse between the first and second reading. At the second reading, the principle is considered, as in the case of public bills; and if the bill be carried, it is referred, if not a railway, canal, or divorce bill, to the 'Committee of Selection,' consisting of the chairman of the Standing Orders Committee, and five other members nominated at the beginning of the session, whose functions are to classify the bills, to nominate the Committees on them, and to arrange their time of sitting. A railway or canal bill is referred to the 'General Committee of Railway and Canal Bills.' This committee forms bills of this class into groups, and appoints the chairman of the committee which is to sit on each bill from its own body, the remaining members, four in number, being chosen from the Committee of Selection. Before the sitting of the committee, every private bill, whether opposed or unopposed, must be examined by the chairman of the Committee of Ways and Means and his council. It is also laid before the chairman of the Lords' Committee and his council, and effect is given to their observations, a proceeding which greatly facilitates the after-progress of the bill in the House of Lords. The Board of Trade, the Secretary of State for the Home Department, the Lords Commissioners of the Admiralty, and the Commissioners of Woods and Forests, also exercise a supervision over private bills of various kinds, by which the respective rights of their departments may be supposed to be encroached on. In the House of Lords, estate bills are referred to the judges. Every bill, at the first reading, is referred to the Examiners, before whom compliance with such standing orders as have not been previously inquired into must be proved. The Standing Orders Committee of the Lords is now assimilated in functions to that of the Commons. The bill is returned to the Commons either with amendments, or with a message that it is agreed to without amendments. In case of

disagreement between the Houses, the same forms are observed as in public bills.

In recent times, the necessity for obtaining private acts has been, in many cases, obviated by general laws adapted to different classes of objects, of which parties are enabled to avail themselves, instead of applying to parliament for special powers.

Royal Assent.—A bill becomes a statute or act of parliament on receiving the royal assent, which is given in the House of Lords, the Commons being also present at the bar. It is given in either of two ways: by letters-patent under the Great Seal, signed by the sovereign's own hand, and communicated to the two Houses by commissioners; or by the sovereign present in person in the House of Lords. When the royal assent is given by commission, three or more of the Lords Commissioners command Black Rod to signify to the Commons that their attendance is desired, on which the Commons, with the Speaker, immediately come to the bar. The commission is then read at length; and the titles of all the bills being read by the Clerk of the Crown, the royal assent to each is signified by the Clerk of the Parliaments in Norman-French, and so entered on the Lords' Journals. In assenting to a public bill, the words used are: 'Le roy [la reine] le vult;' to a private bill: 'Soit fait comme il est désiré;' and to a bill of supply (which is presented by the Speaker, and receives the royal assent before all other bills): 'Le roy remercie ses bons sujets, accepte leur benevolence, et ainsi le vult.' In the case of an act of grace, which has originated with the crown, there was, till lately, no further expression of the royal assent; but the Clerk of the Parliaments, having read its title, said: 'Les prélats, seigneurs, et communes, en ce présent parlement assemblés, au nom de tous vos autres sujets, remercient très-humblement vostre Majesté, et prient à Dieu vous donner en santé bonne vie et longue:' the royal assent, however, has been latterly given to acts of grace in the usual form. The refusal of the royal assent is announced by the words, 'Le roy s'aviserá.' But the necessity for such refusal is generally removed by the observance of the constitutional principle, that the queen has no will but that of her ministers, who only continue in office so long as they have the confidence of parliament. The last instance in which the royal assent was refused was by Queen Anne in 1707, regarding a bill for settling the militia in Scotland.

The royal assent is seldom given in person, except at the close of a session, when the queen attends to prorogue parliament, and then signifies her assent to such bills as have been passed since the last commission was issued; but bills providing for the honour and dignity of the crown, and bills for settling the civil lists, have generally been assented to by the sovereign in person, immediately after they have passed both houses. When the royal assent is given in person, the Clerk of the Crown reads the titles of the bills; and the Clerk of the Parliaments, who has previously received her Majesty's commands in the robing room, makes an obeisance to the throne, and signifies her Majesty's assent, as already described, the queen giving a gentle inclination.

Supplies.—Prior to 1688, in addition to parliamentary taxation, imposts were sometimes levied by an exercise of the royal prerogative. Since the Revolution, no taxes have been raised otherwise than by parliamentary authority. The Commons have the exclusive right to impose taxes and vote money for the public service. The Lords cannot even make an alteration in a bill of supply, except to correct a clerical error. The Lords are not even entitled to insert in a bill any pecuniary penalties,

or to alter the amount or application of any penalty imposed by the Commons; a rule whose rigid assertion has been found to be attended with so much inconvenience that there has latterly been a disposition to relax it. If a bill containing provisions which make a pecuniary charge on the public originate in the Lords, any such provisions are struck out in the bill as sent to the Commons. In the Commons, these provisions are printed in red ink, and supposed to be blank, and may be agreed to in committee. But though the Commons has the exclusive right to grant supplies, a grant requires the ultimate assent of the queen and the House of Lords.

The public revenue of the crown is derived in part from permanent charges on the consolidated fund, and in part from actual grants for specific public services, which require the yearly sanction of parliament. On the opening of parliament, the queen demands from the Commons the annual provision for the public services, and directs estimates to be laid before them. On agreeing to the address in answer to the royal speech, the Commons order the speech to be taken into consideration on another day. On the arrival of that day, a motion is made: 'That a supply be granted to her Majesty,' and the House resolves into a committee to consider that motion. On the day appointed, the committee sits and agrees that a supply be granted, which, being reported, is agreed to by the House. The House then appoints another day on which it resolves itself into a 'Committee of Supply.' The estimates for the army, navy, and ordnance departments, are first laid before the committee; then the estimates for civil services, known as the miscellaneous estimates. The first business of the Committee of Supply is to elect a chairman, who is known as the Chairman of the Committee of Ways and Means, over which he also presides. When the first report of the Committee of Supply has been received and agreed to, a day is appointed for the House to resolve itself into a 'Committee of Ways and Means.' This committee is not appointed till a sum has been voted by the House, nor is it afterwards allowed to vote in excess of the expenditure voted by the Committee of Supply. It is the function of the Committee of Supply to consider what specific grants are to be voted, and of the Committee of Ways and Means to determine how the funds shall be raised which are voted by the Committee of Supply. Without special parliamentary authority, the consolidated fund could not be applied to meet the supplies voted for the service of the year; but to make it so available, the Committee of Ways and Means votes general grants from time to time out of the consolidated fund 'towards making good the supply granted to her Majesty;' and bills are founded on the resolutions of the committee, by which the treasury receives authority to issue the requisite amount from the consolidated fund for the service of the year. It belongs to the Committee of Ways and Means to determine what sums shall be raised by exchequer bills in anticipation of the annual revenue, to make up the supply granted to her Majesty. When the Committee of Supply has determined the number of men that shall be maintained during the year for the army and sea-service, and its resolutions have been agreed to, the *Mutiny Bill* and *Marine Mutiny Bill* are brought in, providing respectively for the discipline of the troops and marines when on shore. Apart from this annual sanction, the maintenance of a standing army in time of peace would be illegal, and the army and marines would be relieved from all martial discipline. The Committee of Ways and Means receives the annual financial statement from the

Chancellor of the Exchequer, popularly called the *Budget*. That minister gives a general view of the resources of the country, and of the financial policy of the government, and presents a probable estimate of income and expenditure for the twelve months ending on the 12th of April of the following year. He states what taxes he intends to reduce, and what new ones he means to impose, and ends by proposing resolutions for the adoption of the committee, which, when reported to the House, form the groundwork of bills for accomplishing the financial objects proposed. The charges for collecting the revenue, have, since 1854, been brought under the supervision of the House of Commons; and estimates are voted for the revenue departments. A new tax cannot be proposed except by a minister of the crown. The resolutions of Committees of Supply and of Ways and Means are reported on a day appointed by the House, and read a first time without a question, and a second time on a question put from the chair, and are agreed to by the House, or may be disagreed to, amended, postponed, or recommitted. When the Committee of Supply is closed, the Committee of Ways and Means authorises the application of money from the consolidated fund, the surplus of ways and means, and sums in the Exchequer, to meet the grant and services of the year, and the resolutions of the committee are carried into effect by the Consolidated Fund Bill, or as it is often called, the *Appropriation Bill*. By a standing order of April 3, 1862, a standing Committee of Public Accounts is appointed at the beginning of each session to examine into the appropriation of the sums granted by parliament to meet the public expenditure. Taxes of a permanent and general character are not now considered in the Committee of Ways and Means.

Petitions.—Among the duties of parliament is the receiving of petitions. A petition must be presented by a member of the House to which it is addressed. Petitions from the corporation of London are, however, presented to the House of Commons by the sheriffs at the bar, or by one sheriff, if the other be a member of the House, or unavoidably absent. In 1840, a petition was allowed to be presented by the Lord Mayor and Aldermen, when the sheriffs were in custody of the serjeant-at-arms. The Lord Mayor of Dublin has been allowed to present a petition at the bar of the House, and the same privilege would probably be conceded to the Lord Provost of Edinburgh. Petitions which violate any of the rules of the House, are not brought up, but returned to the petitioners; and if an irregularity be discovered after a petition is brought up, its presentation is not recorded in the votes. In the House of Lords, when a petition is laid on the table, an entry is made in the Lords' minutes, and afterwards in the Journals of the House, which, however, does not describe its nature and substance. A petition may, on presentation, be made a subject of debate, but unless this is done, there remains no public record of its import, or of the parties by whom it was signed. In the House of Commons, according to standing orders adopted in 1842, the member presenting a petition is to confine himself to a statement of who the petitioners are, the number of signatures, the material allegations of the petition and its prayer. In case of urgency, or where questions of privilege are involved, the matter of the petition may be discussed; but in ordinary cases no debate is allowed, and it is referred to the Committee on Public Petitions, and if relating to a subject with regard to which the member presenting it has given notice of a motion, it may be ordered to be printed with the votes. The reports of the Committee on Public Petitions are printed

twice a week, and point out the name, the subject, and the number of signatures of each petition, and the total number of signatures, and petitions relating to each subject; and, in some cases, the petition itself is printed at full length in the appendix.

Communications with the Crown.—Besides at the opening and proroguing of parliament, and giving of the royal assent, there are other occasions on which the crown communicates with parliament by a message, under the sign-manual, to either House singly, or both Houses separately. Messages are brought by a member of the House, being a minister of the crown, or one of the royal household, and may relate to important public events, the prerogatives or property of the crown, provision for the royal family, &c. An *address* is the mode in which the resolutions of parliament are communicated to the crown. Addresses may be joint, of both Houses, or separate, of either House.

Returns.—Each House has the power of ordering returns from all those public departments which are connected with the revenue, under control of the Treasury, or regulated by statute; but returns of matters connected with the exercise of royal prerogative, as from public departments subject to her Majesty's secretaries of state, are obtained by means of addresses to the crown. A return is not allowed to be ordered in one House regarding the proceedings of the other; when such return is wished, it is usual to make an arrangement by which it is moved in the House to whose proceedings it relates, and after it has been presented, a message is sent to request that it may be communicated. Returns cannot be moved from private associations, or persons not exercising public functions; and the papers and correspondence sought from government departments must be of an official, not a private or confidential description. This rule was, under special circumstances, departed from in 1858, in regard to the opinion of the law-officers of the crown in the case of the *Cagliari*. Accounts and papers presented are ordered to lie on the table, and when necessary, ordered to be printed, or in the Commons referred to the Printing Committee appointed at the beginning of each session.

Election Committees.—The trial of election petitions is one of the duties of the House of Commons. Until 1770 all questions regarding controverted elections were decided by the whole House; the Grenville Act of that year introduced the practice of appointing committees for their trial. The Act 11 and 12 Vict. c. 98, now regulates the trial of controverted elections. An election petition is defined to be a complaint, either (1) of an undue election; (2) that no return has been made according to the requisition of the writ; or (3) of the special matters contained in the return. It must be signed by some person who voted, or had a right to vote at the election, or by some person who claims to be returned, or alleges himself to have been a candidate. The petition must be lodged within fourteen days after the return objected to. Recognisances must be entered into, according to a form prescribed, by sureties to the extent of £1000, in portions not less than £250 for each individual-surety—the petitioner having it in his option to pay the money, or part of it, into the bank instead of finding security. Six members selected from those who are not themselves parties in controverted elections, are appointed at the beginning of every session by the Speaker's warrant as the 'General Committee of Elections.' To this committee all election-petitions are referred; and it is their duty to choose the select committee which is to try each petition. From a list of the members of the House, who are not excused or disqualified from acting or

election committees, they select six, eight, ten, or twelve members who are called the chairmen's panel, and are liable throughout the session to serve as chairmen of select committees, but are exempted from serving on select committees in any other capacity. The remaining members on the list are then divided into five panels, which being ranged in order by lot, are to take their turn successively in furnishing members for election committees. Each select committee consists of four members, chosen by the general committee from the panel in service, and a chairman appointed by the chairmen's panel. The members are sworn at the table by the clerk, 'well and truly to try the matter of the petition, and a true judgment to give, according to the evidence.' Evidence may be taken on oath, and it is enacted by the Corrupt Practices Act, 1863, that no witness is excused from answering a question on the ground that his answer may criminate himself; but a witness, making an answer which tends to criminate him, may demand a certificate which shall be a protection to him from prosecution for such answer. The decision lies with the majority of the committee, the chairman having both a deliberative and a casting vote. The committee are required to determine whether the sitting member, or any other person, be duly returned, or whether the election be void, or whether a new writ ought to issue; and their determination is final, and is carried into execution by the House. They may also make a special report on some other point, which is not final. The most frequent subjects of special reports are bribery, treating, and the use of undue influence, matters regarding which various acts have been passed, the most important being 17 and 18 Vict. c. 102 (1854), 21 and 22 Vict. c. 87 (1858), and 26 Vict. c. 29 (1863), three statutes known as the 'Corrupt Practices Prevention Acts.' It was formerly required to prove agency, before evidence was allowed to be given of the facts on which a charge of bribery rested, but Act 4 and 5 Vict. c. 57, dispensed with this necessity. By the Corrupt Practices Prevention Act, 1863, when an election petition complains of bribery, treating, or undue influence, the committee is required to report whether they had been extensively practised. The candidate declared by an election committee guilty of bribery, treating, or undue influence by himself or his agents, is declared by the Corrupt Practices Act, 1854, to be incapable of representing the same constituency in the then existing parliament. The new law of evidence affords further facilities for the detection of bribery, in so far as it allows the personal examination of the sitting members and candidates.

By the Act of 1854, the offering of money, office, employment, &c., to a voter to induce him to vote or abstain from voting, or the offering of a similar consideration to any person to induce him to procure the return of a candidate or the vote of an elector, the acceptance of such consideration, and the payment of money in the knowledge that it is to be expended in bribery, or the repayment of money which has been spent in bribery, are all declared to be acts of *bribery* punishable by fine and imprisonment, as well as by the forfeiture of £100 with costs to any person who will sue for the same. Any voter who agrees to receive money, office, or employment for voting or abstaining from voting, and any person who, after an election, receives money or other consideration on account of any person having voted or refrained from voting, is also guilty of bribery, and liable to forfeit £10 with costs to any one who will sue for the same. *Treating*, which is defined as the providing of meat, drink, or other entertainment to any person

in order to be elected, or in consideration for any person voting or abstaining from voting, involves a penalty of £50 similarly recoverable, as also does *undue influence*, or interference by intimidation, abduction, or otherwise, with the freedom of electors. Persons guilty of any of these offences are, by the provisions of the same acts, to be struck off the register, and their names inserted in a separate 'list of persons disqualified for bribery, treating, and undue influence,' which is to be appended to the register of voters. Cockades are prohibited, as is the furnishing of refreshment on the day of election to a voter in consideration of his being about to vote. By the Corrupt Practices Act, 1854, it is however declared lawful to provide a conveyance for a voter, though not to pay him a sum of money for travelling expenses. By the Act of 1863, no payment is allowed to be made on behalf of a candidate except through his authorised agent, and all claims against a candidate in respect of an election must be settled within a month, otherwise the right to recover them is barred. A detailed account of election expenses with vouchers is required to be delivered within two months of the election to the returning officers, by whom it is published in a local newspaper, and the vouchers are to be open for a month to the inspection of voters.

Act 15 and 16 Vict. c. 57 enacts that upon the joint address of both Houses of Parliament representing to her Majesty that a committee of the House of Commons has reported that corrupt practices have prevailed extensively at any election, her Majesty may appoint commissioners to make inquiry. The Corrupt Practices Prevention Act, 1863, provides that when an election committee has reported that certain persons named have been guilty of bribery or treating, and their report is confirmed by a commission of inquiry, such report, with the evidence taken by the commission, is to be laid before the attorney-general with the view of instituting a prosecution.

Impeachment.—In the reign of Henry VIII., an act of attainder was the usual mode of proceeding against state offences. A bill of attainder sometimes followed a regular trial and conviction, as in the case of Empson and Dudley, but was sometimes passed without trial, examination of witnesses, or hearing the accused party, as in the attainder of Fisher and Sir Thomas More. The practice of impeachment of extraordinary offenders before the Lords by the Commons, which had been frequent during the 14th and 15th centuries, was revived in the reign of James I. This proceeding is not like bills of attainder or pains and penalties, the making of a new law *pro re nata*, but a carrying out of the already known and established law. The great representative inquest of the nation first find the crime, and then as prosecutors support the charge before the highest court of criminal jurisdiction. It has always been allowed that a peer may be impeached for any crime whether cognizable by the ordinary courts or not. The right of the Commons to impeach a commoner of a capital offence, which was at one time doubted, has been solemnly affirmed by the House of Lords. The trial is conducted by managers for the Commons. Witnesses are summoned by the Lords at the desire of the Commons, and Westminster Hall has usually been the place of trial, the Lord High Steward presiding. The managers make their charges and adduce evidence; the accused answers, and may defend himself by counsel; and the managers have a right to reply. In giving judgment, the question is put by the Lord High Steward to each peer, beginning with the junior baron, on each article separately, whether the accused be guilty. The

answer is, 'Guilty, on my honour,' or 'Not Guilty, on my honour,' the Lord High Steward giving his opinion the last, and the numbers being cast up, the accused is acquitted with the result. Impeachments have not been common in later times; the latest memorable cases are those of Warren Hastings in 1788, and Lord Melville in 1805.

Trial of Peers.—Peers are, in all cases, tried by their peers for treason, misprision of treason, felony, or misprision of felony. During the sitting of parliament, the trial proceeds before the House of Lords, or more properly before the Court of Parliament presided over by the Lord High Steward. When parliament is not sitting, the trial takes place before the Court of the Lord High Steward—a tribunal whose constitution was at one time very objectionable, that officer being allowed to summon what peers he pleased, only with the proviso that the number should amount in all to 23. Act 7 Will. III. c. 3 requires that all the peers who have a right to sit and vote in parliament be summoned. Peers of Scotland and Ireland are, in terms of the Acts of Union, tried in the same way. By 4 and 5 Vict. c. 22, a peer, is liable on conviction to the same punishment as any other of the lieges.

The annual expenses of parliament are about £158,369, of which £72,634 is expended in printing, and the remainder in salaries and emoluments, including £5000 salary to the Speaker of the House of Commons. See T. Erskine May's *Laws, Privileges, Proceedings, and Usage of Parliament*, 5th edition, 1863; 6th edition, 1868.

PARLIAMENTARY CHURCH is a church erected under the authority of an act of parliament. In England such a church is generally called a district church; and the acts of parliament authorising such churches, are known as the Church Building Acts. See PARISH. In Scotland similar churches are called *Quoad Sacra* (q. v.) churches.

PARMA, a former sovereignty of Upper Italy, having the rank of a duchy, and bounded on the N. by Lombardy and Venice, E. by Modena, S. by Genoa and Tuscany, and W. by Piedmont, consisted of the duchies of Parma and Piacenza, which were subdivided into 5 districts, and contained in all 2268 English square miles, with a population of about 475,000. The Apennines, which cross the southern division of the duchies, send off spurs northwards, and give to the northern part of the country the character of a plain, gently undulating, but sloping uniformly to the Po, which is the recipient of all the rivers of the country. The highest peaks of the Apennines in P. are, Monte Alpe di Succisio, about 7000 feet; and Monte Parma and Monte Orsajo, both more than 5250. The mountain-range is richly clad with oak and chestnut forests. The plain, which is very fertile, produces rich crops of grain (including rice), leguminous plants, fruits of all kinds, olives, and grapes; while marble, alabaster, salt, and petroleum are the chief mineral products. Next to agriculture, the production and manufacture of silk, the rearing of cattle and poultry, cheese-making, and the extraction of the mineral products afford the chief employment. Silk and cheese are the chief exports. The cheese, however, known as Parmesan, is not made here, but in the neighbourhood of Lodi (q. v.).

The form of government was monarchical, and the Roman Catholic religion the only one tolerated, though a few Jews are found here and there through the country. The condition of education, though improved of late, is still very defective. The administrative power was in the hands of a council of state, which was divided into two sections—one for internal administration, which acted as a court

of final appeal in matters of justice, the other for finance and military and foreign affairs. The revenue of P. in 1859 was estimated at 11,566,648 liras (£458,085), and the expenditure at 11,273,883 liras (£446,490). The total debt, funded and redeemable, amounted to 15,553,218 liras (£616,167). The army (1859) before the annexation, according to the statistics of 1863, consisted of 3290 soldiers; the duke had also the occasional loan of an Austrian regiment, and the fortress of Piacenza was garrisoned by the troops of that power.

History.—P. and Piacenza belonged in the time of the Roman Empire to Cisalpine Gaul, and after its fall came under the rule of the Lombards, to whose rule succeeded that of the kings of Italy and the German emperors. In the 12th and following centuries, they joined the other territories of Northern Italy which were struggling for liberty and independence, and consequently became involved in the Guelph and Ghibelline contests. Weakened by these strifes, they fell under the domination of the powerful houses of Este, Visconti, and Sforza; but in 1499 they passed under the yoke of the French monarch, Louis XII., from whom they were soon recovered by the Emperor Maximilian, and handed over to Pope Leo X. in 1513. They continued under the sovereignty of the popes till 1543, when they were alienated by Pope Paul III., and with the surrounding territory were erected into a duchy for his natural son Pier-Luigi Farnese, the grandfather of Alessandro Farnese, the celebrated regent of the Low Countries. On the extinction of the male line of Farnese, in 1731, by the death of the eighth duke, Antonio, his niece Elizabeth, the queen of Philip V. of Spain, obtained the duchies for her son Don Carlos, who, however, exchanged them in 1735 with Austria for the throne of the Two Sicilies. In 1748 they were restored along with Guastalla to Spain, and became a duchy for the Infante Don Philip, with a reversion to Austria in case of the failure of his male descendants, or of any of them ascending the Spanish or Neapolitan throne. Philip was succeeded in 1765 by his son Ferdinand, who was an able and enlightened ruler, and expelled the Jesuits in 1768. He died in 1802, and his dominions were immediately taken possession of by the French, and were incorporated with France under the designation of the department of Taro in 1805. In 1814, by the treaty of Paris, P., Piacenza, and Guastalla were presented as a sovereign duchy to the ex-empress Maria Louisa, a proceeding strongly opposed by the king of Spain, who demanded them for his sister, Maria Louisa, the widow of Louis, king of Etruria, the son of Duke Ferdinand. However, in 1817, it was settled that Maria Louisa of Austria should possess the duchies, and that on her death they should descend to Ferdinand Charles, Duke of Lucca, the son of Maria Louisa of Spain, and the rightful heir; and on failure of his heirs, P. should revert to Austria, and Piacenza to Sardinia. The empress governed very much after the Austrian fashion, but with gentleness, though liberal sentiments were looked upon by her with little favour. On her death, in 1847, the Duke of Lucca succeeded as Charles II., and certain exchanges of territory, previously settled by the great powers, took place with Tuscany and Modena—the chief of which being the transfer of Guastalla to Modena in exchange for the districts of Villa-franca, Treschietto, Castevoli, and Melazzo, all in Massa-Carrara, resulting in a loss to P. of about 77 English square miles of territory, and a gain of 193 English square miles. This transfer was not made without great discontent on the part of the inhabitants. The duke's rule was severe and tyrannical, and on an address being presented to him with a view of

obtaining a reform of certain abuses, and a more liberal political constitution, similar to what Tuscany had (February 1848) obtained from its grand-duke, he threw himself into the arms of Austria, and consented to the occupation of his territory by Austrian troops. In March 1848 a revolution broke out, and the duke was compelled to grant the popular demands, but he almost immediately after retired from the country. P. joined with Sardinia in the war of 1848—1849 against Austria, but on the triumph of the latter power was compelled to receive Charles III. (his father, Charles II., having resigned his throne, March 1849) as its ruler. The new duke recalled the constitution which his father had been compelled to grant, and punished with great severity the active agents of the revolutionary movements in his dominions. His arbitrary measures were effectively seconded by his chief minister, an Englishman named Ward, who shared the public obloquy with his master. After Charles III.'s assassination in March 1854, his widow Louise-Marie-Therese de Bourbon, daughter of the last Duke of Berry (q. v.), assumed the government for the behoof of her son Robert I., and made some attempts at political reform; but owing to the excited state of the people they were little effective, and she and her son were compelled to leave the country in 1859, on the outbreak of a new war between Sardinia and Austria. In March 18th of the following year the country was annexed to Sardinia, and now forms a part of the Kingdom of Italy, constituting the two provinces of Parma (area 1251 English square miles; pop. in 1871, 264,331), and Piacenza (area 965 square miles; pop. 225,775), a few of the outlying districts, amounting to about 150 square miles, being incorporated with other provinces.—*Official Statistics of the Kingdom of Italy* (Turin, 1861); *Budget of the Emiliias*; *Report of the Marquis Pepoli to the Minister of Finances* (Turin, 1860); *idem. Report of General Tozze to the Minister of War* (1863).

PARMA, the chief town of the province of the same name in Italy, and formerly the capital of the duchy of Parma, is situated on both sides of the river Parma, 12 miles south from the Po, 75 miles south-east from Milan, and about the same distance east north-east from Genoa, with a population (1879) of 40,725.

The town is of a circular form, and is surrounded by walls and ditches flanked by bastions; the streets are straight and wide, and meet at right angles, the chief of them, a part of the Roman Via Emilia, crossing the city from east to west, and dividing it into two nearly equal parts. P. is celebrated for its churches, 10 in number, the chief of which are the *Duomo*, or Cathedral (consecrated 1106 A.D.), built chiefly in the Lombard style, having the interior adorned with magnificent frescoes by Correggio, and paintings by other artists, and surmounted by a beautiful dome; the *Battisterio*, or Baptistery, one of the most splendid in Italy, begun in 1196 and completed in 1231; the church of the *Madonna della Steccata*, containing the famous painting of 'Moses breaking the Tables of the Law' by Parmigianino. The other celebrated buildings are, the Farnese Palace, a gloomy and ill-constructed edifice; the Farnese Theatre, built (1618—1623) of wood, and now in a most dilapidated condition. P. has also a library containing 140,000 volumes, mostly well selected, and many of them rare and valuable works; a museum of antiquities; a botanic garden; a theatre (*Teatro Nuovo*); an academy of fine arts, founded in 1752, possessing a collection of 600 pictures, many of which are exceedingly valuable. The pictures

most highly esteemed are the 'Madonnas' of Correggio and Francia, the 'St Jerome' of Correggio, and the 'Jesus Glorified' of Raphael.

The manufactures of P. are stockings, porcelain, sugar, wax-candles, and vessels of crystal, also silk, cotton, and fustian stuffs. The chief exports are cheese and silk goods; and in June there is an annual silk fair.

PARMA, BATTLES OF. An indecisive engagement took place here June 29, 1734, between the confederated armies of England, France, and Spain, and the Austrians; and on June 19, 1799, the French under Macdonald were routed by the Russians under Suwarof, with a loss of 10,000 men and 4 generals.

PARMELIA, a genus of Lichens, with a leafy horizontal thallus which is lobed and cut; and orbicular shields (*apothecia*) fixed by a central point, concave, and bordered by the inflexed thallus. The species are numerous, and many are found in Britain. Some of them are occasionally employed in dyeing. Various chemical principles have been discovered in lichens of this genus, as *Usnic* or *Usnic Acid* (also found in species of the genus *Usnea*), and *Parietin*. Valuable medicinal properties—tonic and febrifugal—have been ascribed to *P. parietina*, the Common Yellow Wall Lichen, or Common Yellow Wall Moss of the herb shops, a bright yellow species with deep orange shields, plentiful on walls and trees in Britain and most parts of Europe.

PARMENIDÉS, a Greek philosopher of Elea, in Lower Italy, and in the opinion of the ancients the greatest member of the Eleatic school, flourished about the middle of the 5th c. B.C. Nothing is known with certainty regarding his life, but he is said to have visited Athens in his old age, and to have conversed with Socrates, then quite a youth. The story, though it rests on the authority of Plato, has a suspicious air, and seems as if it were intended to account for the influence which the philosophy of P. undoubtedly exercised on that of Socrates and Plato themselves. P., like Xenophanes of Colophon, sometimes regarded as the first of the Eleatics, expounded his philosophy in verse—his only work being a didactic poem *On Nature*. The leading design of this poem is to demonstrate the reality of Absolute Being, the non-existence of which P. declares to be inconceivable, but the nature of which, on the other hand, he admits to be equally inconceivable, inasmuch as it is dissociated from every limitation under which man thinks. P. is not a theologian in speculation, seeking rather to identify his 'Absolute Being' with 'Thought' than with a 'Deity.' Only fragments of his poem remain, which have been separately edited by Fülleborn (Züllichau, 1795); another collection is that by Brandis, in his *Commentationes Eleaticæ* (Altona, 1815); but the best is to be found in Karsten's *Philosophorum Græcorum veterum Reliquiæ* (Amsterdam, 1835).

PARMIGIANO, GIROLAMO FRANCESCO MARIA MAZZOLA, called Parmigiano or Parmigianino, born at Parma in 1503, an able painter of the Lombard school, and the most distinguished of those who followed the style of Correggio. His pictures attracted much attention when he was little more than fourteen years of age. In 1523 he went to Rome to follow out his studies, and was soon favourably noticed and employed by Clement VII. He was in that city when it was stormed by the imperialists under Bourbon in 1527, and, it is said, was calmly at work on his picture of 'The Vision of St Jerome' (now in the National Gallery, London) when soldiers, bent on pillage, burst into

his studio. He was, however, protected by their leader. After this event he left Rome for Bologna, where he painted various important works, and returned to Parma in 1531. Having engaged to execute several extensive frescoes in the church of S. Maria Steccata, after repeated delays, he was thrown into prison for breach of contract, and on being released, in place of carrying out his undertaking, he fled to Casal Maggiore, in the territory of Cremona, where he died soon afterwards in 1540. Vasari, in his notice of P., attributes his misfortunes and premature death to his passion for alchemy; but this oft-repeated story has been disproved by the researches of late biographers. He executed several etchings, and some wood-cuts are attributed to him.

PARAHIBA, or **PARANAHYBA**, a river of Brazil, rises in the Sierra dos Coroados, between the provinces of Goyas and Piaui, about 11° S. It flows north-east and north, and enters the Atlantic in long. about 41° 40' W. by five mouths, which enclose a delta about 30 miles wide along the shore. These mouths, however, are only from two to four fathoms deep. It drains the province of Piaui, and forms the boundary-line between it and the province of Maranhão. Total length estimated at 750 miles.—A chief tributary of the Parana also bears the name of Parahiba.

PARNASSUS, a mountain greatly celebrated among the ancients, and regarded by the Greeks as the central point of their country. It was in Phocis. It has three steep peaks, almost always covered with snow, and seen from a great distance, the highest being fully 8000 feet above the level of the sea; but as only two of them are visible from Delphi, it was customary among the Greeks to speak of the two-peaked Parnassus. On its southern slope lay Delphi (q. v.), the seat of the famous oracle, and the fountain of Castalia (q. v.). The highest peak was the scene of the orgies of the worship of Dionysus (Bacchus); all the rest of the mountain was sacred to Apollo and the Muses, whence poets were said to 'climb Parnassus,' a phrase still thus employed.

PAROCHIAL BOARD, in Scotland, is the board in each parish which manages the relief of the poor. In England, the same duty is performed by overseers, and in some cases by guardians of the poor.

PAROCHIAL RELIEF is the relief given to paupers by the parish authorities. See **POOR**.

PARODY (Gr. *para*, beside, and *ode*, a song), the name given to a burlesque imitation of a serious poem. Its peculiarity is that it preserves the form, and as far as possible the words of the original, and thereby differs from a Travesty, which is a looser and less literal kind of burlesque. The invention of parodies is commonly ascribed to the Greeks (from whom, at least, we have derived the name); the first parodist, according to Aristotle, being Hegemon of Thasos, who flourished during the Peloponnesian war; according to others, Hipponax. From the fragments that are extant of ancient parody, we infer that Homer was the favourite subject of comic imitation. Thus Hipponax, in his picture of a glutton, ludicrously insinuates a comparison between the feats of his hero in eating and those of Achilles in fighting, by commencing as follows:

Sing, O celestial goddess, Eurymedon, foremost of gluttons,
Whose stomach devours like Charybdis, eater unmatched among mortals.

The *Batrachomyomachia* (Battle of the Frogs and

Mice), erroneously ascribed to Homer, is also a happy and harmless specimen of the parody, which, however, soon began to exchange its jocose and inoffensive raillery for a biting and sarcastic banter, of which numerous specimens may be seen in the comedies of Aristophanes; while the philosopher Timon of Phlius invented, under the name of *Silla*, a new species of satirical parody. Among the Romans we first meet with this form of literature in the period of the decline. All the power of Nero could not prevent his verses from being parodied by Persius. Among modern nations the French—as might naturally be expected from their character—have been most addicted to this literary mimicry. Corneille parodied Chapelain in his *Cid*, and Racine parodied Corneille. The *pot-pourris* of Désangiers are considered by his countrymen models of this ungracious kind of literature, Schiller's famous poem of the *Bell* has been often parodied by German wits. In England, perhaps the best compositions of this nature are the *Rejected Addresses* of the brothers James and Horace Smith. Many will remember, in particular, the parody on Scott's 'Battle of Flodden' in *Marmion*, ending—

'od rot 'em
Were the last words of Higginbotham.

Barham's *Ingoldsby Legends* contains a felicitous parody on Wolfe's *Lines on the Burial of Sir John Moore*. We quote the first stanza as a specimen:

Not a sou had he got, not a guinea or note,
And he looked most confoundedly flurried
As he bolted away without paying his shot,
And his landlady after him hurried.

Thackeray's *Miscellanies* also contain some very clever and satirical prose parodies upon certain of his brother novelists.

The historical development of the parody has been treated by Moser in Daub's and Creuzer's *Studien* (6th vol.). See also Moser's *Parodiarum Exempla* (Ulm. 1819), and Weland's *De Præcipuis Parodiarum Homericarum Scriptoribus* (Gütt. 1833).

PAROLE (literally, a word) is the declaration made on honour by an officer, in a case in which there is no more than his sense of honour to restrain him from breaking his word. Thus a prisoner of war may be released from actual prison on his parole that he will not go beyond certain designated limits; or he may even be allowed to return to his own country on his parole not to fight again, during the existing war, against his captors. To break *parole* is accounted infamous in all civilised nations, and an officer who has so far forgotten his position as a gentleman ceases to have any claim to the treatment of an honourable man, nor can he expect quarter should he again fall into the hands of the enemy he has deceived.

PAROLE EVIDENCE, in Law, means such evidence as is given by witnesses by word of mouth at a trial or hearing of a cause. *Parole Agreement*, in English Law, means any agreement made either by word of mouth or by writing not under seal. If the agreement is made by writing under seal, it is called a deed, or indenture, or covenant, according to the nature of its contents.

PAROPAMISA'N MOUNTAINS. See **AFGHANISTAN**.

PA'ROS, one of the larger islands of the Grecian Archipelago, is situated west of Naxos, from which it is separated by a channel from four to six miles wide. Greatest length, 15 miles; greatest breadth, 9 miles; area, about 77 square miles; pop. 7200. The surface is hilly, the scenery picturesque, and

the soil naturally fertile, but imperfectly cultivated. The island is especially productive in cotton, wax, honey, partridges, and wild pigeons. Near the middle of the island, the mountain Capresso (ancient *Marpessa*), abounds in the famous Parian marble, which was used by many of the greatest sculptors of antiquity. Parekhia, on the west coast, is the principal town, and Naussa, on the north coast, is the chief port.

In ancient times, P., which is said to have been colonised by Cretans, attained great maritime prosperity, and became wealthy and powerful. It submitted to the Persians; and after the battle of Marathon was assailed ineffectually by Miltiades, who received here the wound of which he soon after died. After the death of Xerxes, P. came under the supremacy of Athens, and shared the fate of the other Cyclades. Archilochus, the inventor of iambic verse, was born here.

PAROTID GLAND. See **SALIVARY GLANDS.**

PARQUETRY, a kind of wood mosaic used only for flooring. The art of making inlaid wood floors has until lately much declined in this country, but on the continent it has been much in use, and has been carried to great perfection. Parquetry floors are usually of oak, but other and more ornamental woods have also been much used for giving variety and beauty to the pattern. In the more elaborate kinds of parquetry, veneers are used, but it is much more generally composed of blocks of wood squared at the sides, and laid down so as to combine and form a geometric pattern. Of late, the taste for this work has revived in Britain, and it is beginning to be extensively employed in the better class of buildings.

PARR, SAMUEL, LL.D., a once notable scholar, was born January 15, 1747, at Harrow-on-the-Hill. He entered Emmanuel College, Cambridge, in 1765; but the death of his father, two years afterwards, necessitated his doing something for himself, and he was, in consequence, induced to accept an assistant-mastership at Harrow, where he remained five years. The head-mastership then becoming vacant, P. applied for it, but was rejected, whereupon he left, and started as an independent schoolmaster. In 1777, he was appointed Master of Colchester School, where he was ordained priest, and obtained the curacies of Hythe and Trinity Church. Next year, he became Master of Norwich School; but in 1786, settled at Hatton in Warwickshire, where he spent the rest of his life. In 1787, he published an edition of Bellenden, to which he prefixed his celebrated preface, which is as remarkable for its uncompromising advocacy of Whig principles as for the scrupulous Ciceronianism of its Latinity. He died March 6, 1825.

It is almost impossible to understand the reputation which P. once had. None of his voluminous writings justify it. That he was in some respects an accomplished, and even a great scholar, is undoubted, for he could write Latin of Ciceronian purity and finish; but it is equally undoubted that he never did anything with his boasted scholarship. P. has left the world absolutely nothing to keep it in remembrance of him, yet his complete works (edited by Dr J. Johnstone in 1828)—exclusive of his contributions to periodicals—form eight enormous tomes, and contain 5734 octavo pages, many of them printed in small type. They relate to matters historical, critical, and metaphysical, but in all of them 'the thread of Parr's verbosity is finer than the staple of his argument.' What, then, gave him the fame that he certainly enjoyed during his life? Beyond all question, it was his conversational powers. He was an amazing, an overwhelming

talker. Bold, dogmatic, arrogant, with a memory profoundly and minutely retentive, and with a genuine gift of ephemeral epigram, he seemed, at the tables of statesmen, and wits, and divines, to be a man of tremendous talent, capable of any literary feat; but the learning and the repartee have left little trace of their existence, and posterity declines to admire the wonders that it has neither seen nor heard. See De Quincey's famous essay on 'Dr Samuel Parr on Whiggism in its Relations to Literature' (Author's edition, vol. 5. Edin. Adam and Charles Black, 1862).

PARRA. See **JACANA.**

PARRAKEET, or **PARROQUET**, a name very commonly given to many of the smaller species of the parrot family; generally to species having long tails, and natives of the East Indies, Africa, and Australia, not so frequently to American species; although it is sometimes also applied to some of these, indifferently with the name Parrot.—One of the most beautiful groups of the *Psittacidae*, combining gracefulness of form with splendour of plumage, is that to which the *ALEXANDRINA P.* or *RING P.* (*Pakeornis Alexandri*) belongs. It is about the size of a common pigeon, green, with a red collar, whence its name Ring P., and is a native of the

Warbling Grass or Zebra Parrakeet (*Melopsittacus undulatus*).

East Indies. It is said to have been brought to Europe by some of the members of Alexander the Great's expedition to India, and to have been the first of the parrot tribe known to the Greeks and Romans, by whom it was highly prized, as it still is, not only for its beauty, but for its docility and its power of imitating human speech. Like many of its tribe, it is gregarious, and immense flocks make their abode in some of the cocoa-nut groves of the western parts of Ceylon, filling the air with the most deafening screams. The Ring P. has many congeners, natives chiefly of the East Indies, exhibiting much variety of splendid plumage.—Somewhat like them in length and form of tail, but with longer and stronger legs, is the **GROUND P.**, or **GROUND PARROT** (*Pezoporos formosus*), of Australia, a bird

very common in all the southern parts of New Holland and in Van Diemen's Land, inhabiting *scrub* or ground covered with very low underwood. Its habits are very unlike those of parrots in general; it runs along the ground, and even seeks to escape from enemies by running, unwillingly takes wing, and then only for a short low flight. It makes no nest, but lays its eggs in a hole in the ground. It is a small bird, not much more than 12 inches in entire length, one half of which is occupied by the tail; its colour, dark green above, yellowish below, less brilliant than in many of the parrot tribe, but finely marked and mottled. Its flesh has a very strong *game* flavour. There are numerous other Australian species, distributed in several genera, some of which, although less exclusively than that just noticed, live and seek their food on the ground. Some of them exhibit the greatest splendour of plumage. The only one we shall notice is the ZEBRA P. (*Melopsittacus undulatus*), a very beautiful little species, which has often been brought to England, and has sometimes bred in it. In the vast inland plains of Australia, this P. is to be seen in flocks of many hundreds feeding on the seeds of the grasses.

PARRAS, Mexico. See SUPPLEMENT in Vol. X.

PARRHASIUS, one of the greatest painters of ancient Greece, was the son of Evenor, himself an artist, and was born at Ephesus in the 5th c. B.C. He practised his profession, however, at Athens, the inhabitants of which held him in high estimation, and conferred on him the rights of citizenship. He was already celebrated in the time of Socrates, with whom, according to Xenophon, he held a conversation (*Mem.* 3, 10), and was also a younger contemporary of Zeuxis. The date of his death is unknown. Seneca, who lived several hundred years after, tells a monstrous story about him. He says that when P. was painting his 'Prometheus Vincitur,' he got hold of one of the prisoners taken at the capture of Olynthus by Philip of Macedon (347 B.C.), and crucified him in his studio that he might copy from life the expression of agony. Fortunately for P.'s memory, the anecdote is almost certainly untrue, as it would require us to suppose that he was still alive and painting when upwards of 100 years old. P. appears to have surpassed all his predecessors in purity of design, accuracy of drawing, force of expression, and what is technically called 'finish.' According to Pliny, he was the first who established a true proportion between the different parts of a picture, and delineated with elegance and precision all the minutiae of the features, even to those evanescent motions that betray the most delicate sentiments of the soul. He painted the extremities, such as the hands and fingers, in so exquisite a style, that the intermediate parts seemed relatively—but *only* relatively—inferior. Quintilian calls him the legislator of his art, because his canon of proportion for gods and heroes was followed by all contemporary and subsequent painters. Among his works were an apparently symbolical picture of the Athenian Demos ('People'), a 'Theseus,' 'Naval Commander in full Armour,' 'Ulysses feigning Madness,' 'Castor and Pollux,' 'Bacchus and Virtue,' a 'Meleager, Hercules, and Perseus' on one canvas, a 'Cretan Nurse with a Child in her Arms,' a 'Priest officiating with a Child bearing Incense,' 'Two Young Children,' an 'Achilles,' an 'Agamemnon,' &c. But his subjects were not always of a pure or lofty character. His 'Archigallus' (high-priest of Cybele) and his 'Meleager and Atalanta' were most licentious representations, and gave such pleasure to the Emperor Tiberius, a man of unbounded sensuality that he kept them in his

bedroom, and valued the second in particular at more than a million sesterces.

P. was of an excessively proud and arrogant disposition. He called himself the prince of painters, and claimed to be descended from Apollo; he also painted himself as the god Mercury, and then exposed his own portrait for the adoration of the crowd. His vanity was equal to his pride, and shewed itself even in his apparel, which was of the kind called 'gorgeous.' He generally dressed in a purple robe with a golden fringe, sported a gold-headed cane, and wore boots tied with golden clasps.

PARRICIDE (Lat. *paricida*) is rather a popular than a legal term. In the Roman law it comprehended every one who murdered a near relative; but in English the term is usually confined to the murderer of one's father, or of one who is *in loco parentis*. The parricide does not, in any respect, differ in Britain from the murderer of a stranger; in both cases, the punishment is death by hanging. In the Roman law, a parricide was punished in a much more severe manner, being sewed up in a leather sack, along with a live cock, viper, dog, and ape, and cast into the sea to take his fate with these companions.

PARROT (*Psittacus*), a Linnean genus of birds, now the family *Psittacidae*, of the order *Scansores*, or Climbers (q. v.), comprehending a vast number of species, natives of almost all tropical and subtropical regions; a few species extending further north and south, in America, in New Zealand, and in Van Diemen's Land, even to the neighbourhood of Lake Michigan in North America, and to Terra del Fuego in South America. They are mostly birds of splendid plumage; they vary very much in size, from the Great Macaw, more than three feet in length, tail included, to the little Love-birds, not larger than sparrows. They are mostly gregarious, and are often seen in vast flocks, generally inhabiting forests, and making their nests in trees, feeding chiefly on fruits and seeds, partly also on leaves and buds; but some of them dwelling in open plains, feeding on the seeds of grasses and other plants of humble growth, bulbs and succulent parts of vegetables, and living mostly on the ground. The voices of the P. tribe are generally harsh and discordant, although some of the smaller kinds have not unpleasant voices; but many of the larger have a remarkable power of imitating human speech, and in domestication become capable of articulating not only words but sentences. They exhibit a greater degree of intelligence than is usual in birds, with a monkey-like restlessness and love of trick; and although docile and affectionate, are generally of capricious irritable temper. They have a short, stout, hard beak, rounded on all sides, and enveloped at the base in a membrane in which the nostrils are pierced; the upper mandible generally much longer than the lower, much curved, and sharp pointed. The tongue is almost always very large, thick, round, and fleshy; the muscles which move the mandibles are more numerous and powerful than in most other birds. They make use of the powerful hooked bill as well as of the feet in climbing trees; and employ their feet as hands for holding their food, and bringing it up to the mouth. Their feet differ from those of all the other climbers, in being covered with small tubercle-like scales instead of plates. Some have short and some have long tails. Most of them have short wings. Their intestines are very long and slender, and without coeca.

The *Psittacidae* are easily distinguished from all other birds; but their division into distinct subordinate groups has not been found so easy.

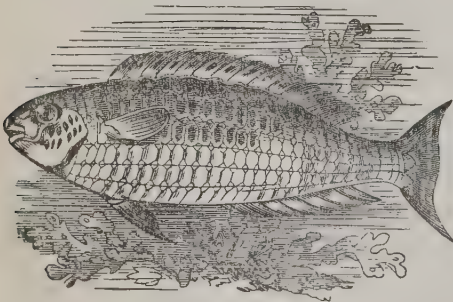

Whilst the name *P.* popularly includes all, except that it is seldom given to some of the smallest species, some are known by the names Macaw, Cockatoo, Parakeet, Lory, Love-bird, &c. See these heads. But some of these names are very vaguely applied. And although the *P.* family is regarded as consisting of a number of very natural groups, the characters and limits of these groups have not yet been very well defined.

The name *P.*, in its most restricted sense, is sometimes applied only to those species which have the upper mandible very distinctly toothed, the lower mandible longer than it is high; and the tail short, and square or rounded; but this use is rather ornithological than popular, the most restricted popular use equally including long-tailed species, such as the Caroline *P.*, which are ornithologically ranked with the macaws.—THE CAROLINE *P.* (*Conurus Carolinensis*) is the species of which the northern range extends far beyond all others of its tribe to the shores of Lake Michigan; although by the increase of cultivation, and the war waged against these birds for their depredations on orchards and corn-ricks, their numbers have been greatly diminished in regions where they were once plentiful. Its whole length is about 14 inches, of which about one half is occupied by the tail; the general colour is green, shaded with blue, and diversified with orange, the wing primaries almost black. It is gregarious, prefers to roost in the holes of hollow trees, and in such situations also the females lay their eggs. It seems to love salt, frequenting salt licks like pigeons. It is easily tamed, but does not acquire the power of articulation.—Of the short-tailed parrots, one of the best known is the GRAY *P.* (*Psittacus erythacus*), a West African species, about the size of a small pigeon, of an ash-gray colour, with a crimson tail. It is famous for its docility, its power of articulation and of imitating noises of all kinds, its loquacity, and its mischievousness. It is very often brought to Europe, and often lives to a great age in confinement. Individuals have been known to attain the age of nearly 100 years.—THE GREEN PARROTS (*Chrysotis*), natives of the tropical parts of South America, are also among the short-tailed parrots most frequently seen in Britain.

PARROT-FISH (*Scaridae*), a family of fishes near the family *Labridæ* (q. v.) or *Cyclo-Labridæ*, of oblong and massive form, with large scales and remarkable for the structure of their jaws and

The species are numerous. Some of them feed on fuci, and some on corals, the younger branches of which they crush, so that the animal part affords them nourishment, whilst the calcareous part is rejected. They are fishes generally of brilliant colours, some of them of wonderful splendour, and have received the name parrot-fish partly on this account, and partly on account of a fancied resemblance in their jaws to a parrot's bill. Most of them are natives of tropical seas. One species is found in the Mediterranean (*S. Creticus*), the *Scarus* of the ancients, of which many wonderful stories were told, as to its love, its wisdom, its ruminating, its emitting of sounds, &c., and which was esteemed the most savoury and delicate of all fishes. It is still held in high esteem for the table. The Greeks cook it with a sauce made of its own liver and intestines.

PARRY, SIR WILLIAM EDWARD, commonly known as SIR EDWARD PARRY, a celebrated English navigator, was born at Bath, 19th December 1790. His father, who was a physician of some eminence, destined him for the medical profession; but acting on the advice of a friend, entered him as a first-class volunteer on board the *Ville-de-Paris*, the flag-ship of the Channel fleet, in 1803. After several years' service, he received his commission as lieutenant, January 6, 1810. Though thus early engaged in active service, his education had not been neglected; he had attained at school to considerable eminence in classical knowledge; and for the first five years after entering the navy, he had particularly studied French and mathematics under the chaplain's superintendence, after which he constantly employed his leisure time in nautical and astronomical studies. In February 1810, he was sent to the Arctic regions in command of a ship, for the purpose of protecting the British whale fisheries and improving the admiralty charts of those regions; but in 1813, he was recalled and despatched to join the fleet then blockading the coast of the United States. He remained on the North American station till the spring of 1817, and during this time he wrote and distributed MS. copies of a work entitled *Nautical Astronomy by Night*, in which rules were given for determining accurately the altitude of the pole by observations of the fixed stars. This work he subsequently published in London. Having returned to England too late to take part in the African exploring expedition, he was, at his urgent request, backed by the recommendations of Mr Barrow, secretary to the Admiralty, appointed to the command of the *Alexander*, under the orders of Captain John Ross in the *Isabella*, and despatched in search of the 'North-West Passage' (q. v.) in April 1818. The expedition returned to England, having made no important discoveries. The admiralty were dissatisfied with the report of Captain Ross; and P.'s opinion, though only communicated to his private friends, having become known to them, he was again sent out (May 1819), and this time commenced that career of discovery (see NORTH-WEST PASSAGE) which has immortalised him as the greatest of all Arctic explorers. P. on his return to Britain was hailed with the utmost enthusiasm, and was made commander (4th November 1820) and a member of the Royal Society. He subsequently made a second and a third voyage to the same regions, but effected nothing further of importance. P. now devoted himself to the discharge of his duties as hydrographer, but such labours were too monotonous for one of his temperament, and he accordingly prepared a plan of an expedition for reaching the north pole, which being submitted to the admiralty and approved of

Parrot-fish (*Scarus harid*).

teeth, the jaws being divided into halves by a median suture, the teeth incorporated with the bone in crowded quincuncial order, the surface even and polished in some species and rough in others, the oldest teeth forming the trenchant border of the jaw, and being succeeded by others as they are worn away, whilst new ones are formed behind.

by them, his old ship the *Hecla* was fitted out for a polar expedition, and P. set sail in her, accompanied by Lieutenant J. C. Ross, 4th April 1827. See **POLAR VOYAGES.** The *Journals of these voyages* were published by order of the admiralty.

P.'s career as an explorer was now closed, and he again returned to his duties as hydrographer, but his health now gave way under this sedentary mode of life, and he exchanged his office for that of commissioner to the Agricultural Company of Australia, for which country he sailed 20th July 1829. He returned to England in November 1834, and filled in succession various government appointments up till December 1846, when he retired from active service, receiving a sinecure office. On 4th June 1852 he was raised to the rank of Rear-admiral of the White, and in the following year was appointed lieutenant-governor of Greenwich Hospital—an office which he held till his death, 7th July 1855, at Ems in Germany, whither he had gone for the benefit of his health. A complete edition of his voyages was published in 1833 (Lond. 5 vols.). His life has been written by his son, the Rev. Edward Parry, M.A. of Balliol College, Oxford, 1857).

PARSEES (People of Pars or Fars, i. e., ancient Persia) is the name of the small remnant of the followers of the ancient Persian religion, as reformed by Zerdusht, or Zoroaster, as he is commonly called. They are also known under the denomination of Guebres, under which head some account will be found respecting their recent history and present numbers. The pre-Zoroastrian phase or phases of their primeval religion will probably for ever remain shrouded in deep obscurity; so much, however, is fully established by recent investigations, that this, and what afterwards became the Brahmanic religion, were originally identical; that in consequence of certain social and political conflicts between the Iranians and the Aryans, who afterwards peopled Hindustan Proper, an undying feud arose, in the course of which the former forswore even the hitherto common faith, and established a counter faith (Ahura), a principal dogma of which was the transformation of the ancient, now hostile, gods into demons, and the branding of the entire *Deva* religion as the source of all mischief and wickedness. Zerdusht, the prophet, whose era is given very differently by ancient writers and by modern investigators, placed variously between 500 or 600 B. C. (Löth) and 1200 B. C. (Haug), had, like all prophets and reformers, many predecessors, chiefly among the Soshyantos or Fire-priests (Atharvans); yet to him belongs the decisive act of separating for ever the contending parties, and of establishing a new community with a new faith—the Mazdayasna or Parsee religion proper, which absorbed the old Ahura religion of the fire-priests. Referring for a summary of what is known and speculated about the person of the great reformer to the article under his name, we shall here confine ourselves to pointing out, as the characteristics of his leading doctrines, that the principle of his theology was as pure a Monotheism as ever the followers of the Jehovistic faith were enjoined. He taught the existence of but one deity, the Ahura, who is called Mazdāo (see ORMUZD), the creator of all things, to whom all good things, spiritual and worldly, belong. The principle of his speculative philosophy is dualism, i. e., the supposition of two primeval causes of the real and intellectual world; the Vohu Manō, the Good Mind or Reality (Gaya), and the Akem Manō, or the Naught Mind, or Non-reality (Ajyāiti); while the principle of his moral philosophy is the triad of Thought, Word, and Deed. Not long, however, did the pure idea of Monotheism prevail. The two sides

of Ahura Mazdāo's being were taken to be two distinct personages—God and Devil—and they each took their due places in the Parsee pantheon in the course of time:—chiefly through the influence of the sect of the Zendiks, or followers of the Zend, i. e., Interpretation. According to Zerdusht, there are two intellects, as there are two lives—one *mental* and one *bodily*; and, again, there must be distinguished an *earthly* and a *future* life. The immortality of souls was taught long before the Semites had adopted this belief. There are two abodes for the departed—Heaven (Garō-De māna, the House of the Angels' Hymns, Yazna, xxviii. 10; xxxiv. 2; cf. Is. vi., Revelat., &c.) and Hell (Drājō-De māna, the residence of devils and the priests of the Deva religion). Between the two there is the Bridge of the Gatherer or Judge, which the souls of the pious alone can pass. There will be a general resurrection, which is to precede the last judgment, to foretell which Sosiosh (Soskyans), the son of Zerdusht, spiritually begotten (by later priests divided into three persons), will be sent by Ahuramazdao. The world, which by that time will be utterly steeped in wretchedness, darkness, and sin, will then be renewed; death, the archfiend of creation, will be slain, and life will be everlasting and holy. These are the outlines of the Zoroastrian creed, as it flourished up to the time of Alexander the Great, throughout ancient Irania, including Upper Tibet, Cabulistan, Sogdiana, Bactriana, Media, Persia, &c.; and it is curious to speculate on the consequences which might have followed Marathon and Salamis had the Persians been victorious. The religion of Ormuzd would have dethroned the Olympians, as it dethroned the gods of the Assyrians and Babylonians; and it would certainly have left its traces upon the whole civilised world unto this day in a much more direct and palpable shape than it now does. From the death of Alexander, however, it gradually lost ground, and rapidly declined under his successors, until, in the time of Alexander Severus, Ardashir 'Arianos' (cf. Mirkhond ap. de Sacy, *Mémoires sur div. Aut. de la Perse*, &c., p. 59), the son of Babegan, called by the Greeks and Romans Artaxerxes or Artaxares, who claimed descent from the ancient royal lineage of Persia, took the field against Artabanus, and slew him (225), thus putting an end to the four hundred years' rule of the Parthians, and founded the Sassanide dynasty. Thus he effected in conjunction with the national Persians, who hated the 'semi-Greek' dynasty of the Arsacide, their leaning to the foreign, and contempt for the Zend religion, and finally for their powerlessness against the spreading conquests of the Romans. The first act of the new king was the general and complete restoration of the partly lost, partly forgotten books of Zerdusht, which he effected, it is related, chiefly through the inspiration of a Magian Sage, chosen out of 40,000 Magians. The sacred volumes were translated out of the original Zend into the vernacular, and disseminated among the people at large, and fire temples were reared throughout the length and the breadth of the land. The Magi or priests were all-powerful, and their hatred was directed principally against the Greeks. 'Far too long,' wrote Ardashir, the king, to all the provinces of the Persian empire, 'for more than five hundred years, has the poison of Aristotle spread.' The fanaticism of the priests often also found vent against Christians and Jews. The latter have left us some account of the tyranny and oppression to which they as unbelievers were exposed—such as the prohibition of fire and light in their houses on Persian fast-days, of the slaughter of animals, the baths of purification, and the burial of the dead according

to the Jewish rites—prohibitions only to be bought off by heavy bribes. In return, the Magi were cordially hated by the Jews, and remain branded in their writings by the title of demons of hell (*Kidushin*, 72 a.). To accept the instruction of a Magian is pronounced by a Jewish sage to be an offence worthy of death (*Shabb*, 75 a.; 156 b.). This mutual animosity does not, however, appear to have long continued, since in subsequent times we frequently find Jewish sages (*Samuel the Arian*, &c.) on terms of friendship and confidence with the later Sassanide kings (cf. *Moed Katan*, 26 a. &c.). From the period of its re-establishment, the Zoroastrian religion flourished uninterruptedly for about 400 years, till, in 651 A.D., at the great battle of Nahavand (near Ecbatana), the Persian army, under Yezdeird, was routed by the Calif Omar. The subsequent fate of those that remained faithful to the creed of their fathers has been described, as we said before, under GUEBRES. At present, some remnants inhabit Yezd and Kirmân, on the ancient soil of their race; others, who preferred emigration to the endless tribulations inflicted upon them by the conquering race, found a resting-place along the western coast of India, chiefly at Bombay, Surat, Nawsari, Achmedâbâd, and the vicinity, where they now live under English rule, and are recognised as one of the most respectable and thriving sections of the community, being for the most part merchants and landed proprietors. They bear, equally with their poorer brethren in Persia, with whom they have of late renewed some slight intercourse for religious and other purposes—such as their Rivâyets or correspondences on important and obscure doctrinal points—the very highest character for honesty, industry, and peacefulness, while their benevolence, intelligence, and magnificence outvies that of most of their European fellow-subjects. Their general appearance is to a certain degree prepossessing, and many of their women are strikingly beautiful. In all civil matters they are subject to the laws of the country they inhabit; and its language is also theirs, except in the ritual of their religion, when the holy language of Zend is used by the priests, who, as a rule, have no more knowledge of it than the laity.

We have spoken of the leading fundamental doctrines as laid down by their prophet. Respecting the practical side of their religion, we cannot here enter into a detailed description of their very copious rituals, which have partly found their way into other creeds. Suffice it to mention the following few points. They do not eat anything cooked by a person of another religion; they also object to beef, pork, especially to ham. Marriages can only be contracted with persons of their own caste and creed. Polygamy, except after nine years of sterility and divorce, is forbidden. Fornication and adultery are punishable with death. Their dead are not buried, but exposed on an iron grating in the Dokhma, or Tower of Silence, to the fowls of the air, to the dew, and to the sun, until the flesh has disappeared, and the bleaching bones fall through into a pit beneath, from which they are afterwards removed to a subterranean cavern.

Ahuramazdao being the origin of light, his symbol is the sun, with the moon and the planets, and in default of them the fire, and the believer is enjoined to face a luminous object during his prayers. Hence, also, the temples and altars must for ever be fed with the holy fire, brought down, according to tradition, from heaven, and the sully of whose flame is punishable with death. The priests themselves approach it only with a half-mask (*Penom*) over the face, lest their breath should defile it, and never touch it with their

hands, but with holy instruments. The fires are of five kinds; but however great the awe felt by Parsees with respect to fire and light (they are the only eastern nation who abstain from smoking), yet they never consider these, as we said before, as anything but emblems of Divinity. There are also five kinds of 'Sacrifice,' which term, however, is rather to be understood in the sense of a sacred action. These are—the slaughtering of animals for public or private solemnities; prayer; the Daruns sacrament, which, with its consecrated bread and wine in honour of the primeval founder of the law, Hom or Heomoh (the Sanscr. *Soma*), and Dahman, the personified blessing, bears a striking outward resemblance to the sacrament of the Lord's Supper; the sacrifice of Expiation, consisting either in flagellation, or in gifts to the priest; and, lastly, the sacrifice for the souls of the dead. The purification of physical and moral impurities is effected, in the first place, by cleansing with holy water (*Nirang*), earth, &c.; next, by prayers (of which sixteen, at least, are to be recited every day) and the recitation of the divine word; but other self-castigations, fasting, celibacy, &c., are considered hateful to the Divinity. The ethical code may be summed up in the three words—purity of thought, of word, and of deed: a religion 'that is for all, and not for any particular nation,' as the Zoroastrians say. It need hardly be added, that superstitions of all kinds have, in the course of the tribulations of ages, and the intimacy with neighbouring countries, greatly defiled the original purity of this creed, and that its forms now vary much among the different communities of the present time.

Something like a very serious schism, however, has lately broken out in the Parsee communities, and the modern terms of Conservative and Liberal, or rather bigot and infidel, are almost as freely used with them as in Europe. The sum and substance of these innovations, stoutly advocated by one side, and as stoutly resisted by the other, is the desire to abolish the purification by the *Nirang*—a filthy substance in itself—to reduce the large number of obligatory prayers, to stop early betrothal and marriage, to suppress the extravagance in funerals and weddings, to educate women, and to admit them into society. Two counter alliances or societies, the 'Guides of the Worshippers of God' and 'the True Guides' respectively, are trying to carry out at this moment, by means of meetings, speeches, tracts, &c., the objects of their different parties.

The literature of the Parsees will be found noticed under PERSIAN LANGUAGE AND LITERATURE, and ZEND-AVESTA. Besides the latter, which is written in ancient Zend, and its Gujarati translation and commentaries, there are to be mentioned, as works specially treating of religious matters, the *Zardusht-Nameh*, or Legendary History of Zerdusht; the *Sadder*, or Summary of Parsee Doctrines; the *Dabistan*, or School of Manners; the *Desatir*, or Sacred Writings, &c. All these have been translated into English and other European languages.

On the influence Parsism has had upon Judaism and its later doctrines and ceremonial, and, through it, upon Christianity and Mohammedanism—which besides drew from it directly—we cannot dwell here at any length. So much, however, may be stated, that the most cursory reading of the sacred Parsee books will shew, in a variety of points, their direct influence upon the three Semitic creeds. Of works treating on the subject of this article, we mention principally, Hyde, *Vet. Rel. Pers. Hist.* (Oxon. 1760, 4to); Ouseley, *Travels in the East* (Lond. 1819); Anquetil du Perron, *Exposition des Usages des*

Parsee; Rhode, *Die heil. Sage der alten Baktrier*, *Meder u. Perser*, &c. (Frank.-a-M., 1820, 8vo); Dosabhoj Framjee, *The Parsees*, &c. (Lond. 1858); Dadabhai Naoroji, *The Manners and Customs of the Parsees*; and *The Parsee Religion* (Liverpool, 1861, 8vo); and lastly, Haug's *Essays on the Parsee Religion* (Bombay, 1862), and Spiegel's *Erän* (Berl. 1863).

PARSLEY (*Petroselinum*), a genus of plants of the natural order *Umbelliferae*. The species are annual or biennial, branching, smooth, herbaceous plants, with variously pinnate leaves.—COMMON P. (*P. sativum*), which has tripinnate shining leaves, one of our best known culinary plants, is a native of the south of Europe, growing chiefly on rocks and old walls, and naturalised in some parts of England. The cultivation of P. is extremely simple, and an annual sowing is generally made, although when cut over and prevented from flowering, the plant lives for several years. A variety with curled leaflets is generally preferred to the common kind with plain leaflets, as finer and more beautiful, being often used as a garnish; it is also safer, as the poisonous Fool's P. (q. v.) is sometimes gathered by mistake instead of the other.—HAMBURG P. is a variety with a large white carrot-like root, cultivated for the sake of its root, and much in the same way as the carrot or parsnip. To produce large roots and of delicate flavour, a very rich soil is required. The foliage of P. is not merely of use for flavouring soups, &c., but is nutritious, at the same time that it is stimulating, a quality which it seems to derive from an essential oil present in every part of the plant. P. contains also a peculiar gelatinous substance called *Apine*. The bruised leaves of P. are sometimes employed as a stimulating poultice. The seeds are a deadly poison to many birds, and when powdered, they are sometimes used for killing lice.

PARSNIP (*Pastinaca*), a genus of plants of the natural order *Umbelliferae*, having compound umbels with neither general nor partial involucre; yellow flowers with roundish, involute, sharp-pointed petals; calyx almost without teeth; fruit dorsally compressed and flat, with a broad border, the ridges very fine. The species are annual, biennial, or perennial herbaceous plants, with carrot-like, often fleshy roots, and pinnate leaves.—THE COMMON P. (*P. sativa*) is a native of England, although not of Scotland, and is abundant in some districts, particularly in chalky and gravelly soils. It is also found in many parts of Europe, and of the north of Asia. It is a biennial, with angular furrowed stem, 2–3 feet high, pinnate leaves with ovate leaflets, rather shining, cut and serrated, and a three-lobed terminal leaflet. The root of the wild plant is white, aromatic, mucilaginous, sweet, but with some acridness; and injurious effects have followed from its use. Cultivation has greatly modified the qualities both of the root and foliage, rendering them much more bland. The P. has long been cultivated for the sake of its root, which in cultivation has greatly increased in size, and become more fleshy. The flavour is disliked by some, as well as the too great sweetness, but highly relished by others; and the root of the P. is more nutritious than that of the carrot. The produce is also, on many soils, of larger quantity; and although the P. delights in a very open rich soil, it will succeed in clayey soils far too stiff for the carrot. It is rather remarkable that it has not been extensively cultivated as a field-crop, and for the feeding of cattle, except in the Channel Islands and in limited districts of continental Europe; more particularly as cattle are very fond of it, and not only the flesh of cattle fed on it is of excellent quality, but the butter of dairy-cows fed on parsnips

in winter is far superior to that produced by almost any other kind of winter-feeding. The mode of cultivation of the P. scarcely differs from that of the carrot. There are several varieties in cultivation. A very large variety, cultivated in the Channel Islands on deep sandy soils, has roots sometimes three or four feet long; but this is fully twice the ordinary length, and there is a smaller turnip-rooted variety sometimes cultivated in gardens where the soil is very shallow. The P. is used chiefly in winter, whether for the table or for feeding cattle. It is improved rather than injured by frost; but is apt to become *rusty*, if allowed to remain too long in the ground; and exhibits acrid qualities after it has begun to grow again in spring. The root of the P. is much used in the north of Ireland for making a fermented liquor, with yeast and hops; and both in England and Ireland, for making P. wine, which has some resemblance to Malmsey wine.—Another species, the CUT-LEAVED P. or SEKAKUL (*P. Sekakul*), having pinnatifid cut leaflets, a native of India, Syria, and Egypt, is cultivated in the Levant, and is very similar in its uses to the common parsnip.

PARSON, in English Ecclesiastical Law, means the incumbent of a benefice in a parish. He is called parson (Lat. *persona*) because he represents the church for several purposes. He requires to be a member of the Established Church of England, and to be duly admitted to holy orders, presented, instituted, and inducted; and requires to be 23 years of age. When he is inducted, and not before, he is said to be in full and complete possession of the incumbency. The theory is, that the freehold of the parish church is vested in him, and as the legal owner, he has various rights of control over the church. He is also the owner of the churchyard, and as such is entitled to the grass. As owner of the body of the church, he has a right to control of the church bells, and is entitled to prevent the churchwardens from ringing them against his will. The distinction between a parson and vicar is, that the parson has generally the whole right to the ecclesiastical dues in the parish, whereas the vicar has an appropriator over him, who is the real owner of the dues and tithes, and the vicar has only an inferior portion. The duty of the parson is to perform divine service in the parish church under the control of the bishop, to administer the sacraments to parishioners, to read the burial-service on request of the parishioners, to marry them in the parish church when they tender themselves. He is bound to reside in the parish, and is subject to penalties and forfeiture, if he without cause absent himself from the parish. He is subject to the Clergy Discipline Act, in case of misconduct.

PAR'SONSTOWN (anciently called BIRR), a considerable inland town on the river Brosna, in King's County, Ireland, 69 miles west-south-west from Dublin, with which city it is connected by a branch-line issuing from the Great Southern and Western Railway at Ballybrophy. Pop. in 1871, 4939; of whom 4049 were Roman Catholics, 725 Protestants of Established Church, and the rest Protestants of other denominations. Birr had its origin at an early period in a monastery founded by St Brendan, and was the scene of many important events, both in the Irish and in the post-Invasion periods. The castle, which was anciently the seat of the O'Carrolls, was granted by Henry II. to Philip de Worcester; but it frequently changed masters, and even alternated between English and Irish hands. By James I. it was granted to Lawrence Parsons, ancestor of the present proprietor, the Earl of Rosse; but through the entire period of

the civil wars, its possession was constantly disputed, until after 1690, when the Parsons family was finally established in possession of the castle and adjoining lands. About this time, Birr returned two members to parliament, but the privilege was a temporary one. The castle has been rebuilt. The modern P. is one of the handsomest and best built and appointed inland towns in Ireland, with two handsome churches, and several meeting-houses, a nunnery, a handsome pillar with a statue of the Duke of Cumberland, a town-hall, a library, literary institute, a model and other schools. But the great attractions of P. are the castle, the observatory, and the laboratory of the Earl of Rosse (q. v.). P. is an important corn-market, a considerable centre of inland commerce; but with the exception of a distillery and brewery, it is almost entirely without manufactures. It is a large military station, and is also the seat of a Union workhouse.

PĀRSWANĀTHA, the twenty-third of the deified saints of the Jains, in the present era. He and *Mahāvīra*, the twenty-fourth, are held in highest esteem, especially in Hindustan. In a suburb of Benares, called Belupura, there is a temple honoured as the birthplace of Pārs'wanātha. See JAINAS.

PART, in Music. When a piece of music consists of several series of sounds performed simultaneously, each series is called a part.

PARTERRE, in gardens laid out in the old French style, the open part in front of the house, in which flower-beds and closely-cut lawn were intermingled according to a regular plan.

P'ARTHENOGENESIS (from the Gr. *parthenos*, a virgin, and *genesis*, the act of production) is a term invented by Professor Owen to indicate propagation by self-splitting or self-dividing, by budding from without or within, and by any mode save by the act of impregnation; the parthenogenetic individuals being sexless or virgin females. See the article GENERATIONS, ALTERNATION OF. For many remarkable facts in relation to parthenogenesis in insects, the reader is referred to Professor Owen's eighteenth lecture, *On the Comparative Anatomy and Physiology of Invertebrate Animals*; and to Siebold, *On Parthenogenesis*, translated by Dallas.

P'ARTHENON, the temple of Minerva at Athens; one of the most celebrated of the Greek temples, and usually regarded as the most perfect specimen of Greek architecture. Many of the sculptures have been brought to England, and are now in the British Museum. See GRECIAN ARCHITECTURE.

PARTHENOPE'AN REPUBLIC (from *Parthénopé*, the oldest name of the city of Naples) was the name given to the state into which the kingdom of Naples was transformed by the French Republicans, 23d January 1799, and which only lasted till the following June, when the invading army was forced to retreat.

PARTHIA, anciently a country of Western Asia, lying at the south-east end of the Caspian Sea, from which it was separated by a narrow strip, known as Hyrcania, now forms the northern portion of the province of Khorassan, and is an almost wholly mountainous region. Its rivers are merely mountain torrents, which are supplied by the melting snow on the Elburz range during winter and spring, but are mostly dry in summer and autumn.

The original inhabitants are believed to have been of Scythian race, as shewn by their language as well as by their manners, and to belong to the great Indo-Germanic family. If this be the case, as is very probable, the term Parthian, from its analogy

to the Scythian word *parthe*, banished, seems to indicate that they were a tribe who had been driven to P. out of Scythia (i. e., Central Asia). The Parthians, during the time of the Roman Republic, were distinguished by primitive simplicity of life and extreme bravery, though at the same time much given to bacchanalian and voluptuous pleasures. They neglected agriculture and commerce, devoting their whole time to predatory expeditions and warfare. They fought on horseback, and after a peculiar fashion. Being armed solely with bows and arrows, they were rendered defenceless after the first discharge; and, to gain time for adjusting a second arrow to the bow, turned their horses, and retired, as if in full flight, but an enemy incautiously pursuing, was immediately assailed by a second flight of arrows; a second pretended flight followed, and the conflict was thus carried on till the Parthians gained the victory, or exhausted their quivers. They generally discharged their arrows backwards, holding the bow behind the shoulder; a mode of attack more dangerous to a pursuing enemy than to one in order of battle. The Parthians first appear in history as subject to the great Persian Empire. After the death of Alexander the Great, P. formed part of the Syrian kingdom, but revolted under Antiochus II., and constituted itself into an independent kingdom under the *Arsacidae* (see ARSACES), 250 B.C., a race of kings who exercised the most completely despotic authority ever known, treating their subjects as if the vilest of slaves; yet so accustomed did the Parthians become to this odious rule, that some of the later monarchs, who had received a Roman education, and after their accession treated their subjects with ordinary justice and humanity, were completely despised. The capital of the Parthian monarchy was Hecatompylos ('the city of the hundred gates'), now Damgan. The Parthian dominion rapidly extended to the Euphrates on the west and the Indus on the east, and became a most powerful and flourishing empire; Seleucia, Ctesiphon—the capital of the Persian emperors of the Sassanidae—and other celebrated cities date their rise from this period, and soon eclipsed, in size and splendour, the ancient Hecatompylos. In spite of repeated attacks on the part of the Romans, the Parthians maintained their independence (see CRASSUS, SURENA); and though Trajan, in 115–116 A.D., seized certain portions of the country, the Romans were soon compelled to abandon them. In 214 A.D., during the reign of Artabanus IV., the last of the Arsacidae, a revolt, headed by Ardshir, son of Babegan, broke out in Persia, and the Parthian monarch, beaten in three engagements, lost his throne and life, while the victor substituted the Persian dynasty of the Sassanidae (q. v.) for that of the Arsacidae. Some scions of the Parthian royal family continued for several centuries to rule over the mountainous district of Armenia, under the protection of the Romans, and made frequent descents upon Assyria and Babylonia; but their history is obscure and of little importance.

PARTIAL LOSS, in the law of Marine Insurance, is a loss which is not total; and therefore the insurer is not entitled to abandon or give up the remains of the ship or cargo, and claim the entire insurance money; but he is bound to keep his ship or goods, and claim only in proportion to his actual loss or damage.

PARTICIPLE (Lat. *participium*, part-taking), the name of a class of words which have the meaning of a verb with the form of an adjective. The name is said to have been given from their partaking of the nature both of a verb and of an adjective.

Some grammarians make the participle a distinct part of speech, but it is more commonly classed as a part of the conjugation of the verb. There are in English two participles, one in *ing*, usually called the present, but properly the imperfect, because it expresses continued, unfinished action, e. g., *loving, writing*; and the other expressing past action, and ending either in *ed* (*t*) or in *en*, e. g., *loved, written*. In Ang.-Sax. and Old Eng., the imperfect participle ended in *and*, e. g., *haband* (having), corresponding to the modern Ger. *habend*, Gr. *echont*(os), Lat. *habent*(is). In the sentence, 'He is *writing* a letter,' *writing* is the imperfect participle; in 'the *writing* of the letter occupies him,' or '*writing* is a difficult art,' it is a substantive, and had a different origin. In the latter case, *-ing* corresponds to the Ang.-Sax. termination *-ung*, used in forming substantives from a large class of verbs; thus, Ang.-Sax. *halgung* (hallowing) is equivalent in meaning and in etymology to Lat. *consecratio*; similarly, modern Ger. *Vernichtung*, annihilation, from *vernichten*, to annihilate. Such a phrase as, 'while the letter is *writing*,' seems to be a shortened form of the now antiquated, 'is a-writing,' which was originally, 'is in writing.' Although this mode of expression is liable in some cases to ambiguity, it is terser and more idiomatic than the circumlocution of, 'is being written,' which is often substituted for it. The verbal substantive in *-ing* is often exactly equivalent to the infinitive; thus, '*standing* long in one position is painful' = '*to stand*,' &c. It has this advantage, that while it can be construed as a noun (e. g., with a possessive case), it can retain at the same time the usual adjuncts of a verb; as, 'What are we to infer from the king's dismissing his minister?' The use of this form contributes not a little to the peculiar brevity and strength of the English language.

PARTICK, a town of Scotland, in the county of Lanark, prettily situated, chiefly on a rising ground on the Kelvin, immediately above its junction with the Clyde, and about three miles west-north-west of the Cross of Glasgow, of which city it now forms a suburb. Nine-tenths of the workmen of P. are engaged in ship-building, and there are numerous ship-building yards, flour-mills, cotton factories, and bleach-fields. A large proportion of the inhabitants are engaged in business in Glasgow, and for their accommodation extensive ranges of handsome villas have been built here. Pop. 1851, 3131; 1861, 8183; 1871, 17,691; 1881, 27,410.

PARTINICO, SALA DI, a post-town of Sicily, in the province of Palermo, and 19 miles south-west of the city of that name, at the foot of a grand precipice of red limestone. The plain in the vicinity is of surpassing fertility; corn, wine, oil, fruit, and sumach are produced in rich abundance; and linen and woollen goods are manufactured. Pop. 15,658. Scattered vestiges of ancient habitations are still to be seen on the summit of the height above the town, and are said to be the ruins of the ancient *Parthenicum* mentioned in the *Itinerary* of Antoninus and there only.

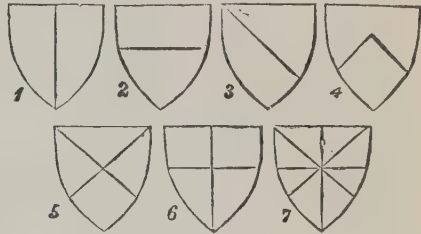

PARTISAN is a name for a halberd or pike, or for a marshal's baton. The name is also given to the leader of a detached body of light troops, who make war by harassing the enemy, rather than coming to direct fighting, by cutting off stragglers, interrupting his supplies, and confusing him by rapid strategy. The action of such a corps is known as *Partisan warfare*.

PARTITION, a thin interior wall dividing one apartment from another. It is usually of brick-work, $4\frac{1}{2}$ or 9 inches thick, or of timber with standards about $4\frac{1}{2}$ inches thick covered with lath

and plaster. Wooden partitions are used when there is no sufficient support for brick. When these have to carry joists or any other weight, they ought to be constructed in the form of a truss (q. v.).

PARTITION, or **PARTITURA**, in Music. See **SCORE**.

PARTITION LINES, in Heraldry, lines dividing the shield in directions corresponding to the ordinaries. According to the direction of the partition lines, a shield is said to be party or parted per fess, per pale, per bend, per chevron, per saltire;

Partition Lines in Heraldry.

a shield divided by lines in the direction of a cross, is said to be quartered; and a shield parted at once per cross and per saltire, is said to Gironné (q. v.) of eight. The partition lines are not always plain; they may be engrailed, invected, embattled, wavy, nebuly, indented, dancetté or raguly—forms which will be found explained under separate articles.

PARTNERSHIP, in the law of England, is the union of two or more individuals acting under a contract, whereby they mutually contribute their property or labour for the purpose of making profits jointly. When a partnership is confined to a particular transaction or speculation, it is usually called a joint-adventure, and the parties are joint-adventurers. The usual criterion by which a partnership is ascertained to exist, as distinguished from other arrangements, is that there is a community of profit; it is not essential that both should suffer losses equally or proportionably, for one partner may stipulate that he shall not be liable to loss. This stipulation is binding between the partners, but of course is insufficient to prevent the partners from being all liable to third parties. So one partner may contribute all the capital or all the labour. A dormant partner is one whose name does not generally appear to the world as a partner, but who nevertheless is to all intents and purposes a partner, with equal rights and liabilities to the rest. In order to constitute that kind of community of profit which is the chief ingredient in a partnership, it is necessary that the partner share in the profits as a partner; for in many cases, clerks, servants, or agents receive a commission or remuneration proportioned to profits, and yet are not partners, for this is merely one mode of ascertaining the salary which they are to receive. In all such cases, therefore, the distinction as to whether there is a partnership or not turns on the consideration whether the alleged partner receives a share of the profits, as such, or merely receives a salary proportioned to profits, without having a specific interest in the firm. The contract of partnership may be entered into either by word of mouth or in writing. If no specified term be agreed upon, it is a partnership at will, and may be dissolved by either of the parties at pleasure. Sometimes, also, the Court of Chancery will interfere to dissolve the partnership before the

time appointed; but this only happens when some unforeseen and urgent reason exists, as that one of the partners has become a lunatic, or has proved grossly dishonest, or the object of the partnership cannot be carried out. Mere differences of opinion on minor matters are no ground for seeking a dissolution. The partners may make any kind of arrangement between themselves that they think proper; but if these are unusual and special stipulations, there is no certainty of securing the same being adhered to, without a formal deed or indenture of partnership being executed. Thus, it is common to stipulate as to the capital each is to contribute, and as to the proportion of profits he is to receive, as to what is to be done in case of the death of a partner, &c. Unless a stipulation is made to the contrary, the rule is, that the death of one of the partners dissolves the partnership. So does his bankruptcy. It is also a rule that no new partner can be introduced without the consent of the rest. There is also a peculiarity in the law of England as to the form of remedy—the rule being, that partners cannot sue each other in a court of law in respect of partnership transactions, but the only remedy is by a bill in Chancery. As against third parties, whatever may be the secret arrangements between themselves, the rule is, that any partner can bind the firm in all matters which are within the scope of the partnership, each being by the nature of the contract made the agent of all the rest for business purposes. Thus, any one may accept a bill in the name of the firm, provided such be one of the modes of doing business. It is, however, to be borne in mind, that the firm is only bound by one of the partners in those matters which are strictly within the proper business of the firm, which is an important qualification of the general power. Within the above limits, each partner can bind the rest of his copartners, however imprudent or foolish may be his act, for it is one of the implied conditions, that all have full confidence in each other. It follows from this principle, that the firm is liable for the dealings of each partner on its behalf within the scope of the partnership, that each is liable to the full extent for all the debts of the firm; in short, each is liable to his last shilling for the solvency of the firm. Hence, it is often of importance for a partner, on leaving the firm, to know how to terminate this liability. The rule is, that as regards all strangers, a notice in the *Gazette* is good notice: but as between the firm and those who have had dealings with it, the *Gazette* notice is of no use, unless it can be proved that the party had actual notice given to him—and hence a circular notice sent to customers announcing the fact of retirement, is the only course effectual.

The practice of individuals entering into large associations, now called joint-stock companies, which were originally only extended partnerships, has led to a separate code as to these being framed for the United Kingdom. See JOINT-STOCK COMPANIES. The practice of limiting the liability of partners or shareholders in joint-stock companies had of late years led to the belief, that a similar restriction might well be extended to ordinary partnerships, and accordingly a bill was introduced into parliament in 1864 to enable this to be done. By that bill—which, however, did not extend to Scotland—any person may place a specific sum of money in a firm, and become a partner, with liability limited to such sum. Such limited partner, however, is to refrain from all participation in the conduct of the business, otherwise he will become a general partner. Nor is his name to appear in the title of the firm. But for his own security and satisfaction, he is entitled to examine the books, so as to ascertain

the profits. In this kind of partnership, certain particulars are to be registered with the registrar of joint-stock companies, such as the name and place of business of each partner, describing whether he be a general or limited partner, the nature of the business, and the place of carrying it on, the name of the firm, the amount lent by each limited partner, and the time at which it is to be repaid. This kind of partnership may be renewed from time to time on fresh registration. Any clerk or servant may be allowed to share profits without incurring the liability of partner. The register-books of this class of partnerships are to be open to the registrar. These partnerships may sue in the name of the firm. This step may be considered at present in the light of an experiment, but it is expected to take firm root in modern business, as it enables capitalists and traders to unite on a more rational basis, and combine their several interests and capacities much more effectually than could be done heretofore.

In Scotland, the law of partnership, though in its essential features the same with the law of England, differs in one or two particulars. The partnership is treated as a distinct person in law, the partners being only its sureties or cautioners; and the consequence of this is, that in actions by or against the firm, the individual partners need not be named, though in practice one or two of them generally are named. Each partner may also sue the firm as if it were a distinct person; and the firm may be made bankrupt without any of the partners being sequestered. See Paterson's *Comp. of E. & S. Law*, p. 214.

PARTRIDGE (*Perdix*), a genus of gallinaceous birds, of the family *Tetraonidae*, having a short, strong bill, naked at the base; the upper mandible convex, bent down at the tip; the wings and tail short, the tarsi as well as the toes naked, the tarsi not spurred.—The COMMON P., or GRAY P. (*P. cinerea*), is the most plentiful of all game-birds in Britain, and becomes increasingly plentiful as cultivation is extended, whilst the range of the moorfowl is restricted. It is not found in the Outer Hebrides. On the continent of Europe, it is abundant in almost all districts suitable to its habits, from Scandinavia to the Mediterranean, and is found also in the north of Africa, and in some parts of the west of Asia. It varies considerably in size; those found in rich lowlands being generally the largest, and about 12½ inches in entire length; whilst those which inhabit poorer and more upland districts are rather smaller. The female is rather smaller than the male. The upper parts of both are ash-gray, finely varied with brown and black; the male has a deep chestnut crescent-shaped spot on the breast, which is almost or altogether wanting in the female. The male has also the throat and sides of the face bright rust-colour, of which there is less in the female. A variety called the Mountain P. has the plumage brown. The P. is seldom found far from cultivated land. It feeds on grain and other seeds, insects and their larvæ and pupæ, and the pupæ of ants are very generally the food sought at first for the young. It pairs early in spring, at which time fierce conflicts take place among the males. The nest is usually on the ground, among brushwood and long grass, or in fields of clover or corn, and generally contains from twelve to twenty eggs. The young run as soon as they are hatched. Both parents shew a very strong attachment to their young, and great courage in repelling assailants; they have also recourse, like many other birds, to stratagem, to draw off the most powerful and dangerous enemies, such as dogs, in another direction, fluttering close before them as if broken-winged, whilst the brood escape. Until the end of autumn, the parent birds and their brood

keep together in a *covey*; late in the season, several coveys often unite into a *pack*, when it becomes much more difficult for the sportsman to approach them. The flight of the P. is strong and rapid for a short distance, but it does not seem to be capable of a long-sustained flight. The eggs of partridges are often hatched, and the young birds reared, by the domestic hen, the chief requisite being a plentiful supply of ants when the birds are very young. Partridges thus reared become very tame, but they seldom breed in the aviary.—The RED-LEGGED P. (*P. rufus*, or *Caccabis rufus*, the genus or sub-genus *Caccabis* being distinguished by a rudimentary blunt spur on the tarsi) is a native of the south of Europe and of the Channel Islands, and is now also plentiful in some parts of England, particularly Norfolk and Suffolk, into which it has been introduced. It is rather larger than the Common P., stronger on the wing, and less easily approached by the sportsman, whilst it is also less esteemed for the table. The upper parts are of a reddish-ash colour; the throat and cheeks white, bounded by a collar of black, which expands in black spots on the breast; and the sides exhibit bars of black. The plumage is smooth.—Two other species, nearly allied to this, are found in some of the southern parts of Europe. India has a number of species. The habits of all the species much resemble those of the Common Partridge.—The name P. is sometimes extended so as to include the species of *Oryx* (see VIRGINIAN QUAIL), and in South America is sometimes given to the Tinamous.

PARTRIDGE BERRY. See GAULTHERIA.

PARTRIDGE PIGEON (*Geophaps*), an Australian genus of *Columbidae*, approaching more than most of the pigeons, in character and habits, to the true gallinaceous birds, and particularly to partridges. Their plumage is beautiful, and generally with a bronze tinge and lustre on the wings, which causes them to be sometimes called Bronze-wings. There are several species. They live mostly on the ground, and rise with a whirring noise, like the pheasant, when disturbed. They are highly esteemed for the table.—*Geotrygon montana*, a species of another genus of *Columbidae*, bears the name of PARTRIDGE DOVE in the West Indies. It also seeks its food chiefly on the ground, although it affects well-wooded districts.

PARTRIDGES, in Artillery, were very large bombards formerly in use at sieges and in defensive works. They are mentioned in Froissart.

PARTRIDGE-WOOD, a very pretty hard-wood from the West Indies and Brazil; it is usually of a reddish colour, in various shade from light to dark, the shades being mingled in thin streaks; but in some choice sorts they are curled upon one another so as to resemble the feathers of the partridge, whence its name. One variety occurs in which the colours are remarkably bright, and it is consequently called Pheasant-wood. In Brazil, this beautiful wood is so plentiful that it is employed in ship-building, and it is said to be used in British navy-yards under the name of Cabbage-wood, but this is doubtful; many woods are known as partridge, and several as cabbage wood. Among the Brazilians, it is called 'Angelim,' and they describe four sorts—*Angelim de pedra* (the Stone Angelim), *A. vermelho*, (Red Angelim), *A. amargoso* (Bitter Angelim), and *A. varzea* (Cultivated Angelim). Its chief use in Great Britain is for cabinet-work, Tunbridge-ware, parasol-sticks, fans, and other small matters, for which its beauty recommends it. It is said to be yielded by the leguminous tree (*Andira inermis*), which is found not only in the Brazils, but in other parts of South America and the West Indies.

PARTS OF SPEECH are the several kinds of classes into which the words of a language are divided. There is nothing in the outward form of words that would enable us to divide them into classes. The distinction lies in the offices that the several words perform in a Sentence (q. v.). All words performing the same office in sentences belong to the same class. The essential parts of speech are the Noun, Adjective, Pronoun, Verb, Adverb, Preposition, Conjunction (see these several heads). The Articles (q. v.) are not distinct parts of speech, being essentially pronouns; and Interjections (q. v.) hardly belong to articulate speech. To name the class or part of speech to which each word of a sentence belongs, is called to *parse* it.

PARTURITION. See MIDWIFERY.

PARTY, in Heraldry. See PARTITION LINES.

PARTY-WALL is the wall dividing two houses or tenements, and which is, in a certain sense, one and indivisible, though the property of two or more parties. The question as to who is the owner of any particular part of the party-wall, is solved by ascertaining who is the owner of the soil on which it is built. In the absence of evidence to the contrary, it is presumed that half of the soil belongs to the owner on one side, and the other half to the owner of the other side; and unless the wall has stood twenty years and upwards, each owner can do what he likes with his own half, and can pare it away if he likes. But in general, mutual interest prevents each party from resorting to his strict legal rights. A practice exists for one who builds a house adjoining the wall of a neighbour, to pay for half the expense. In Scotland, a party building close to the wall of another's house, can compel the owner of the first house to give him half of the wall or gable, on paying half the expense; while in England there is no such compulsion. In Scotland, where the practice exists of building houses in flats lying each upon the other, the law is not clearly settled, and requires to be cleared up as to what is the nature of the property or interest which each proprietor of a flat has in that part of the gable bounding his own flat. The better opinion is, that each is the entire owner of his half of the gable, the others having merely cross servitudes; and hence it follows, that if the flats on both sides of a gable belong to one owner, he can make a communication through the gable, provided he do not injure the chimney-flues of the lower flats, or the stability of the structure.

PÂRVATÎ (from the Sanscrit *parvata*, mountain, literally, mountain-born) is one of the names by which Durgâ, the consort of S'iva, is usually called, she being the daughter of the mountain Himalaya.

PA'RVISE, a porch or open space in front of the door of a church.

PASCAGOULA, a river, and bay at its mouth, in Mississippi, U.S. The river, formed by the junction of numerous branches, drains the south eastern portion of the state, and flows into Mississippi Sound. A ship-canal has recently been cut through the shell-reef at its mouth. It is navigable 100 miles through a sandy region of pine-forests, supplying turpentine. The villages on the bay are summer resorts from Mobile and New Orleans; and on the shores at night are heard sounds like the Æolian harp, supposed to be caused by some kind of shell-fish.

PASCAL, BLAISE, one of the most distinguished philosophers and scholars of the 17th c., was born at Clermont, in Auvergne, France, June 19, 1623. His father, Etienne Pascal, was president of the Cour des Aides at Clermont. His mother, Antoinette

Bezou, died while he was little beyond infancy. He had two sisters—the elder, Gilberte, Madame Perier, afterwards his biographer; the younger, Jacqueline, who became a nun of Port Royal, under the celebrated Mère Angelique, sister of Antoine Arnauld. From childhood, Blaise gave evidence of extraordinary abilities; and when he reached his eighth year, his father resigned his office at Clermont, and came to Paris, in order personally to direct the boy's education. For the purpose of concentrating all the boy's efforts upon languages, his father kept out of his reach all books treating the subject of mathematics, for which he had early evinced a decided taste; and it is recorded that by his own unaided speculations, drawing the diagrams with charcoal upon the floor, he made some progress in geometry. One account represents him as having thus mastered the first thirty-two propositions of the first book of Euclid's *Elements*—a statement which carries its own refutation with it. Thenceforward, he was permitted freely to follow the bent of his genius. In his sixteenth year, he produced a treatise on Conic Sections, which extorted the almost incredulous admiration of Descartes. In his nineteenth year, he invented a calculating-machine; and turning his attention to the novel questions as to the nature of fluids, which Torricelli's theories had raised, he produced two essays, which, although not published till after his death, have established his reputation as an experimental physicist. His father having accepted an office at Rouen, P. was there brought much into intercourse with a distinguished preacher, Abbé Guillebert, a member of the Jansenists, but a man of great eloquence, a great master of ascetic theology, from whom and from other members of the same rigid sect, as well as from the writings of Arnauld, St Cyran, and Nicole, P.'s mind received a deeply religious turn; and his health having suffered much from excessive study, he gave himself up in great measure to retirement and theological reading, and to the practice of asceticism. The death of his father, and his sister Jacqueline's withdrawal to Port Royal, confirmed these habits; and it is to this period that we owe his magnificent though unfinished *Pensées*, which have extorted the admiration even of his unbelieving, and therefore unsympathising critics. Having fully identified himself with the Jansenist party, he was induced (1655) to take up his residence at Port Royal, although not as a member of the body, where he resided till his death, entirely given up to prayer and practices of mortification, among which practices may be mentioned that of wearing an iron girdle, studded with sharp points, which he forced into his flesh whenever he felt himself assailed by sinful thoughts. In the controversy to which the condemnation of Arnauld by the Sorbonne (1655) gave rise, P. took a lively interest; and it was to this controversy that he contributed the memorable *Lettres Provinciales*, published under the pseudonym of Louis de Montalt. These famous Letters (eighteen in number, not reckoning the nineteenth, which is a fragment, and the twentieth, which is by Lemaistre) are written, as if to a provincial friend, on the absorbing controversial topic of the day. The first three are devoted to the vindication of Arnauld, and the demonstration of the identity of his doctrine with that of St Augustine. But it was to the later letters that the collection owed both its contemporary popularity and its abiding fame. In these P. addresses himself to the casuistry and to the directorial system of Arnauld's great antagonists, the Jesuits; and in a strain of humorous irony which has seldom been surpassed, he holds up to ridicule their imputed laxity of principle on the obligation of restitution, on simony, on probable opinions, on

directing the intention, on equivocation and mental reservation, &c. In all this, he professes to produce the authorities of their own authors. Of the extraordinary ability displayed in these celebrated Letters, no question can be entertained; but the Jesuits and their friends loudly complain of their unfairness, and represent them as in great part the work of a special pleader. The quotations, with the exception of those from Escobar, were confessedly supplied by P.'s friends. It is complained that many of the authors cited are not Jesuits at all; that many of the opinions ridiculed and reprobated as opinions of the Jesuit order, had been in reality formally repudiated and condemned in the Society; that many of the extracts are garbled and distorted; that it treats as though they had been designed for the pulpit and as manuals for teaching, works which in reality were but meant as private directions of the judgment of the confessor; and that, in almost all cases, statements, facts, and circumstances are withheld, which would modify, if not entirely remove, their objectionable tendency. See JESUITS. To all which the enemies of the Jesuits reply by arguments intended thoroughly to vindicate Pascal. P. himself entertained no compunctions feeling for the production of these Letters, but even at the approach of death declared his full satisfaction with the work, such as it was. His later years were made very wretched by continued, or at least frequently recurring hypochondria, under the influence of which he suffered from very painful fantasies, which he was unable to control. His strength was completely worn out by these and other infirmities, and, prematurely old, he died at the early age of thirty-nine in Paris, in the year 1662. His *Pensées sur la Religion, et sur quelques autres Sujets*, being unfinished, were published with suppressions and modifications in 1669; but their full value was only learned from the complete edition which was published at the instance of M. Cousin (2 vols., 8vo, Paris, 1844). Of all his works, the *Lettres Provinciales* have been the most frequently reprinted. They were translated into Latin in the lifetime of P. by Nicole, under the pseudonym of a German professor, 'Wilhelm Wendroc,' and an edition in four languages appeared at Cologne, in 1684.

PASCO, or CERRO DE PASCO, an important mining city in Peru, in the department of Junin, stands at an elevation of upwards of 13,000 feet above sea-level, 80 miles north-east of Lima in a direct line, but upwards of 130 miles by the winding mountain road. It consists of a collection of huts spread over an area that has been hollowed out and perforated in all directions by mines. The number of the inhabitants varies according to the state of the mines; being sometimes considerably more than 12,000, and often much less. The Cerro, or 'mountain knot,' of Pasco rises in Sachuanata, 16,000 feet above the level of the sea. Coal is found in the vicinity.

PAS-DE-CALAIS (Fr. for Strait of Dover), a department in the north of France, bounded on the N. by the department of Nord and the Strait of Dover, and on the W. by the Strait of Dover and the English Channel. Area, 1,631,590 acres, of which 883,300 acres are cultivated, and 236,707 in meadows. Pop. (1872) 761,158. The surface is level, with the exception of a ridge of hills running from the south-east to the north-west, ending in Gris-nez Cape (q. v.), and forming the water-shed between the North Sea and the English Channel. The rivers, which are of no considerable length, are the Scarpe and Lys in the basin of the North Sea, and the Authie and Canche belonging to the basin

of the English Channel. The rivers are navigable within the department, and are connected by canals. The coast-line is 80 miles in length, and the shores are in certain parts low and sandy; while for several miles on either side of Gris-nez, cliffs similar to those of Dover front the sea. The climate is mild, but exceedingly inconstant. The soil is very fertile—all the usual cereal and leguminous crops are produced in abundance—and the country is very productive both as regards agriculture and manufactures. Fishing is actively carried on, on the coast, particularly in the neighbourhood of Boulogne. Coal of an indifferent quality is raised, the excellent quarries of the department are worked, and considerable quantities of turf are cut. The industrial establishments are numerous and important, as iron-foundries, glass-works, potteries, tanneries, and numerous bleach-works, and mills and factories of various kinds. Boulogne and Calais are the principal harbours. There are six arrondissements—Arras, Béthune, St Omer, St Pol, Boulogne, and Montreuil. The capital is Arras.

PASENG. See GOAT.

PA'SEWALK, a town of Prussia, in the government of Stettin, 25 miles west-north-west of the city of that name, on the Uker. It contains two churches, two hospitals, and several woollen-cloth and leather factories; and carries on an active general trade. Pop., exclusive of military, 8146.

PASHA', or PACHA, a title used in the Ottoman empire, and applied to governors of provinces, or military and naval commanders of high rank. The name is said to be derived from two Persian words—*pa*, foot or support, and *shah*, ruler—and signifies 'the support of the ruler.' The title was limited in the early period of the Ottoman empire to the princes of the blood, but was subsequently extended to the grand-vizier, the members of the divân, the seraskier, capitan-pasha, the begler-begs, and other civil and military authorities. The distinctive badge of a pasha is a horse's tail, waving from the end of a staff, crowned with a gilt ball; in war, this badge is always carried before him when he goes abroad, and is at other times planted in front of his tent. The three grades of pashas are distinguished by the number of the horse-tails on their standards; those of the highest rank are pashas of three tails, and include, in general, the highest functionaries, civil and military. All pashas of this class have the title of vizier; and the grand-vizier is, *par excellence*, a pasha of three tails. The pashas of two tails are the governors of provinces, who generally are called by the simple title 'pasha.' The lowest rank of pasha is the pasha of one tail; the sanjaks, or lowest class of provincial governors, are of this rank. The pasha of a province has authority over the military force, the revenue, and the administration of justice. His authority was formerly absolute, but recently a check was imposed on him by the appointment of local councils. The pasha is in his own person the military leader and administrator of justice for the province under his charge, and holds office during the pleasure of the sultan—a most precarious tenure, as the sultan can at any moment, in the exercise of his despotic power, exile, imprison, or put him to death; and this has frequently been done in cases where the pasha's power has excited the apprehension, or his wealth the avarice of his royal master.

PASKEVITCH, IVAN FEODOROVITCH, Count of Erivan, Prince of Warsaw, and a Russian field-marshal, was born at Poltava, May 19, 1782. He was descended from a Polish family, and was at first a page to the Czar Paul, but entered the army,

and served in the campaign in 1805, which was ended by the defeat of Austerlitz; and then against the Turks. He took a prominent part in the campaign of 1812, and several times defeated the French under Eugène, Ney, and St Cyr; he was also present at Leipzig and the conflicts under the walls of Paris. In 1823, he was appointed commander-in-chief against the Persians, whom he completely defeated, conquering Persian Armenia, taking Erivan, and ending the war by the peace of Turkmanshai (q. v.), a peace exceedingly favourable to Russia. In recompense for these services, he was created Count of Erivan, and received a grant of 1,000,000 rubles (£158,600). In 1828 and 1829, he made two campaigns against the Turks in Asia, signalised by the taking of Kars, Erzerum, and other important provinces, and terminated by the treaty of Adrianople in 1829. In 1831, P., now a field-marshal, was appointed viceroy of Poland, put an end to the revolt within three months after his appointment, and reconstructed the administration on the basis of a complete incorporation with Russia. Such were the vigour and severity of his rule, that the eventful year 1848 passed over without any attempt at revolution. When Russian intervention in Hungary had been resolved upon, P., though now 67 years of age, marched into that country at the head of 200,000 men, and, after a junction with the Austrians, defeated the Hungarians in several battles, and by mere force of numbers crushed out the last spark of insurrection. The 50th anniversary of his military service was celebrated at Warsaw, in 1850, with the utmost rejoicings, and on this occasion the sovereigns of Austria and Prussia conferred on him the rank of field-marshal in their respective armies. In 1854, he unwillingly took the command of the Russian army on the Danube; but fortune, which had hitherto invariably smiled upon him, deserted him at Silistria; and after undergoing a succession of sanguinary repulses, and being himself grievously wounded, he withdrew his army, and resigning the command, retired to Warsaw, where he fell into a state of profound melancholy, and died January 29, 1856.

PA'SPALUM, a genus of grasses, with spikes either solitary or variously grouped, one-flowered spikelets, and awnless paleæ. The species are numerous, natives of warm climates.—*P. scrobiculatum* is cultivated as a cereal in India, where it is called Koda. See MILLET. It will grow in very barren soils, and delights in a dry loose soil. *P. exile* is cultivated in like manner in the west of Africa, where it is called Fundi (q. v.) or Fundungi.—Other species are valuable as fodder-grasses. *P. purpureum* is a very important fodder-grass in the coast districts of Peru, during the dry months of February and March. *P. stoloniferum*, also a Peruvian species, has been introduced into France. Among the North American species are *P. frutescens*, *setaceum*, *leve*, *distichum*, *digitaria*, &c.

PASQUE FLOWER (*Pulsatilla*), a genus of plants of the natural order *Ranunculaceæ*, by many botanists still included in *Anemone*, the chief distinguishing characteristic being the long feathery awns of the fruit. The species are perennial, silky, herbaceous plants, with doubly pinnatifid or doubly trifid leaves, and a simple one-flowered scape. They are narcotic, acrid, and poisonous. The Common P. (*Pulsatilla vulgaris* or *Anemone pulsatilla*) is a native of many parts of Europe, and of chalky pastures in several parts of England. It has widely bell-shaped bluish-purple flowers. Another species, *P. or A. pratensis*, a native of the continent of Europe, not of Britain, has smaller and more perfectly

bell-shaped blackish-purple flowers.—These plants emit, when bruised, a pungent smell; and contain, as their principal constituent, a peculiar pungent essential oil, which, in combination with *Anemonic Acid*, forms an acrid and very inflammable substance called *Anemonine*, or *Pulsatilla Camphor*, and

Pasque Flower (*Anemone pulsatilla*).

is sometimes used in medicine. *Pulsatilla* is a favourite medicine of the homœopaths. *Easter Eggs* are coloured purple in some places by the petals of the pasque flower.—More acrid than any of the species just named is *Pulsatilla patens*, which occasionally even blisters the skin.

PASQUINADE, an anonymous or pseudonymous publication of small size, sometimes printed, sometimes only posted up or circulated in manuscript, and having for its object the defamation of a character, or at least the turning of a person to ridicule. The name is derived from *Pasquino*, a tailor remarkable for his wit and sarcastic humour, who lived in Rome towards the close of the 15th c., and attracted many to his shop by his sharp and lively sayings. Some time after his death, a mutilated fragment of an ancient statue, considered to represent Menelaus supporting the dead body of Patroclus, was dug up opposite his shop, and placed at the end of the Braschi Palace, near the Piazza Navoni. It was named after the defunct tailor, and thus the practice originated of affixing to it placards containing satires and jests relative to the affairs of the day—the pope and the cardinals being favourite victims of the invisible satirists. Until quite recently, it was the only outlet which the Roman had for his opinions and feelings. One or two may be quoted as specimens of the mordant style of the Pasquin statue. ‘Great sums,’ said the satirist one day, in an epigram addressed to Pope Paul III., ‘were formerly given to poets for singing; how much will you give me, O Paul, to be silent?’—On the marriage of a young Roman called Cesare to a girl called Roma, the statue gave the following advice: ‘Cave, Cæsar, ne tua Roma respublica fiat.’ Next day the rival statue of Marforio, in the Capitol, replied: ‘Cæsar imperat;’ to which Pasquin with exquisite malice retorted: ‘Ergo coronabitur.’

PASSAGE, WEST, a seaport town upon the western shore of the estuary of the river Lee, in the

county of Cork, Ireland, which has risen into importance chiefly as a watering-place, and as the shipping-port and marine suburb of the city of Cork, from which it is distant, by the Cork and Passage Railway, about 6 miles. As the river above P. is not navigable for ships above 400 or 500 tons burden, ships of higher tonnage discharge their cargoes at Passage. It is also a ship-building station. Pop. 2363; of whom about four-fifths are Catholics; 400 Protestants of the Established Church, and the rest of other religious denominations.—There is another small town of the same name, **EAST PASSAGE**, near the mouth of the Suir, in the county of Waterford, Ireland.

PASSAGLIA, CARLO, a Roman Catholic theologian of great eminence, who has obtained much notoriety in connection with the recent movement for the unity of Italy, is a native of the duchy of Lucca, where he was born May 2, 1812. His origin is very humble, and he entered extremely young as a scholar of the Jesuit Society, of which he was enrolled a member in the year 1827. Having obtained much distinction in the schools of the order, and having, as is usual with its members, taught for some time in the lower schools, he completed his theological studies in the Roman College, and was appointed Professor of Canon Law, and eventually of Dogmatical Theology. His reputation for learning stood in the very first rank of Roman Catholic theology, and his lectures were exceedingly admired for their eloquence and erudition, but were considered in some respects too diffuse for the class of pupils who frequented his school. During the temporary withdrawal of the Jesuits from Rome in 1843—1851, P. with some of his brethren came to England, where he taught theology to the young brethren of his order, and on the re-establishment of the Jesuits in the Roman College, he resumed possession of his chair. During the discussions which preceded the definition of the doctrine of the Immaculate Conception of the blessed Virgin Mary (q. v.), P. prepared an elaborate treatise as well on the doctrine as on the history of that question, which was published at the cost of the Roman government. Soon afterwards, however, the dissatisfaction which was felt at the unsuitable character and method of his lectures, led to some remonstrance on the part of the authorities of the order, and ultimately to his resignation of the professorship of theology. Still, however, he continued a member of the Society; and the pope, who felt a warm friendship for him, established in the Roman university a special chair of Philosophy for him, of which he took possession, but which he did not long retain. In the end of 1858, or early in 1859, he left the Society of the Jesuits, and soon afterwards he began to take an active part in the discussions as to the temporal power of the pope; and with a view to an accommodation of the difficulties in which it was involved, he undertook a voluntary mission to Turin, which, however, led to no results. Having fallen under suspicion in Rome, and his house having been invaded by a domiciliary visit of the police, he withdrew from Rome, and settled at Turin, where he established a journal, entitled *Il Mediatore*, which in 1864 was still in course of publication. He was elected a member of the Turin parliament, in which career, however, his success fell far short of his reputation.

P.’s principal works are the treatise on the Immaculate Conception already referred to (4 vols. 4to); a treatise (Latin) on the Primacy of St Peter (8vo, 1850); a scholastic treatise entitled *Commentarius Theologicus de Partitione Divinæ Voluntatis* (8vo, Rome, 1851); an apology for the cause of Italian unity, entitled *Pro Causa Italica; aa*

Episcopos Catholicos (Florence, 1861), in which he recommends the church to make peace with the nation; several essays on various subjects, and a Reply to Renan's *Vie de Jésus* (Italian).

PASSAIC, a river of New Jersey, U. S., rises in Morris County, and after a circuitous south-easterly course of 90 miles, empties into Newark Bay. It is navigable for sloops for a short distance; and its falls of 72 feet at Patterson furnish water-power to numerous factories, and are an attraction to tourists.

PASSAMAQUODDY BAY opens out of the Bay of Fundy, between Maine and New Brunswick, North America. It is 12 miles long by 6 wide, and shut in by a cluster of islands so as to form an excellent harbour. It receives the St Croix, Didgequash, and other rivers, and forms the harbour of the flourishing town of Eastport. The bay abounds in fish, and has tides of 25 feet.

PASSANT, a heraldic term used to express the attitude of an animal in a walking position, with

his head straight before him (fig. 1); fig. 2 represents the attitude, *Passant gardant*; fig. 3, *Passant regardant*.

PASSAROWITZ, a well-built town of European Turkey, in the province of Servia, 5 miles south of the Danube, and 15 miles east of Semendria. Its streets are wide and unpaved, its houses detached, and surrounded with palisades. Pop. 5000. The town is chiefly noteworthy for the treaty which was signed here by Prince Eugene and the grand vizier, July 21, 1718. By this treaty, which put an end to the war undertaken by the Turks against Venice in 1714 for the conquest of the Morea, a truce of 25 years was established, and the Banat of Temesvar, the western portion of Wallachia and Servia, the town and territory of Belgrade, and a part of Bosnia, were secured to the House of Austria.

PASSAU, a picturesque, fortified, frontier town of Bavaria, at the confluence of the Inn and the Ilz with the Danube, 90 miles east-north-east of Munich. It consists of P. Proper (triangular in shape, and occupying an eminence on the tongue of land between the right bank of the Danube and the left bank of the Inn), and the suburbs, Innstadt, on the right bank of the Inn; Anger and Fort Oberhaus, between the Danube and the Ilz; and Ilzstadt, on the left bank of the Ilz. At the point of junction, the Inn is both wider and has had a longer course than the Danube, the former being 834 feet; while the latter is only 696 feet wide. A wooden bridge over the Inn, resting on eight piers of granite, connects Innstadt with P., and the Danube is crossed by a fine bridge resting on seven piers, also of granite. Fort Oberhaus, on the left bank of the Danube, stands on steep, wooded cliffs, at an elevation of upwards of 400 feet, and commands the passage both of the Inn and Danube, besides which the town is further defended by the castle of Niederhaus, and by ten detached forts. The appearance of P., situated at the confluence of two great rivers, and rising like an amphitheatre on the most beautiful spot of the Danube, is strikingly effective and picturesque. Among the chief buildings are the cathedral, the bishop's palace, the

post-office, where the treaty of P. was signed in 1552; the Jesuits' College, a large building now used as a school; and the Church of St. Michael's. In the Cathedral Square (Dómpplatz) is a bronze statue of King Maximilian Joseph, of recent erection. P. contains also numerous picture-galleries, collections of antiquities, and benevolent and charitable institutions. The women of P. are famous for their beauty. Pop. 13,883.

The natural advantages of this site, in a military point of view, were appreciated at an early period by the Romans, who erected a strong camp here, garrisoned it with Batavian troops, and from this circumstance named it *Batava Castra*. P. was long the see of a bishopric founded in the 7th c., but secularised in 1803. By the treaty of P., signed here in 1552 by the emperor Charles V. on the one side, and the Protestant princes of Germany on the other, public recognition of the Lutheran faith among the institutions of the empire was granted. The cathedral of P. and great part of the town were consumed by fire in 1662.

PASSECAILLE and **PASSEPIED**, two old French dances, the music of the former being in $\frac{3}{4}$, the latter in $\frac{4}{4}$ time. Compositions under these names, suggestive of the dances in question, though not meant for dancing, occur among the 'Suites,' or collections of short pieces for the harpsichord or clavichord by Sebastian Bach and Handel.

PASSENGER PIGEON (*Ectopistes migratorius*), a species of pigeon, native of North America, and particularly interesting from the marvellous numbers of which its flocks are often composed. The genus to which it belongs has, like the turtle doves, a bill more slender than the ordinary pigeons, notched, and with a tumid fleshy covering above at the base; the head is small in proportion to the body, the legs are short and strong, the feet naked, the tail either rounded or wedge-shaped, the wings long and pointed. The P. P., generally known in North America as the Wild Pigeon, has a long wedge-shaped tail; the whole length being from 15 to 17 inches, of which the tail occupies nearly

Passenger Pigeon (*Ectopistes migratorius*).

one half. It is a beautiful bird, of very graceful form and finely-coloured plumage. The plumage of the female is duller than that of the male.—The P. P. is found in almost all parts of North America, from the Gulf of Mexico to the Arctic regions. It

is not, properly speaking, a bird of passage; its migrations being apparently altogether consequent on the failure of the supplies of food in one locality, and the necessity of seeking it in another, and not connected with the breeding season or the season of the year. Its power of flight is very great, and it is supposed to be able to sustain a long flight at the rate of sixty miles an hour. Passenger pigeons have been killed in the neighbourhood of New York, with their crops full of rice, which they must have collected in the fields of Carolina or Georgia not many hours before. It is not, therefore, very wonderful that wanderers of this species should occasionally appear in Britain and in other regions far from their native abode. The nest of the P. P. in the American forests generally consists of a few dry twigs placed in a fork of the branches of a tree, and containing two eggs, sometimes only one egg. They breed two or three times in a season. In the backwoods, vast numbers of pigeons building in one breeding-place, many nests, sometimes 100 or more, are often to be seen in one tree. These great breeding-places extend over a vast tract of forest, sometimes not less than forty miles in length; but in the more cultivated parts of the United States the P. P. builds singly and not in communities. The numbers of birds forming the communities of the western forests surpass calculation. Flocks of them are to be seen flying at a great height in dense columns, eight or ten miles long; and there is reason to suppose, from the rapidity of their flight, and the number of hours taken by a column in passing a particular spot, that in some of their great migrations the column, a mile broad, is more than 150 miles long. Their roosting-places, as well as their breeding-places, are of prodigious magnitude. The graphic descriptions of Wilson and Audubon are too long to be quoted; but there is perhaps nothing of the kind so wonderful in relation to any species of bird. The noise of wings and of cooing voices is as loud as thunder, and is heard at the distance of miles. It drowns the report of guns. The multitudes which settle on trees, break down great branches by their weight, so that it is dangerous to pass beneath. They crowd together, alighting one upon another, till they form solid masses like hogsheds, and great numbers are killed when the branches break. The inhabitants of the neighbouring country assemble, shoot them, knock them down with poles, stifle them by means of pots of burning sulphur, cut down trees in order to bring them in great numbers to the ground, eat them, salt them, and bring their hogs to fatten on them. Wolves, foxes, lynxes, cougars, bears, racoons, opossums, polecats, eagles, hawks, and vultures all congregate to share the spoil. The flesh of the P. P. is of a dark colour, but tolerably pleasant. That of young birds is much esteemed. The nestlings are in general extremely fat, and are sometimes melted down for the sake of their fat alone. The food of the P. P. consists chiefly of beech-mast and acorns, but it readily eats almost any kind of nut, berry, or seed.

PASSENGERS BY LAND AND SEA. The law affecting passengers by land, in a carriage or public conveyance, may be stated as follows: The owners of the railway or other carriage do not contract to carry the passenger with perfect safety; they do not warrant that he will not be injured; but they merely contract to carry him without any negligence on their part. Hence, in case of accident, though it is not strictly correct in point of law to assume that the accident arose from some negligence of the carrier, unless there is evidence to support it, this presumption is in point of fact always made,

and it lies on the carrier to shew that it was from no fault or negligence on his part that the accident happened. As questions of negligence must almost always be decided by a jury, and their prepossessions are against admitting the idea that accidents arise from any cause except negligence of the carrier—which is a wholesome doctrine—it seldom ever happens that a railway or public company attempt to dispute their responsibility on that ground. The rule is that a railway company are responsible for the negligence of any of their servants; and hence, in case of accidents, all passengers injured, and in case of death, the parent, husband, wife, or children of the deceased passenger, invariably make a claim of compensation, except when the accident was caused by the passenger's own personal negligence. For while a carrier is bound to use due care to carry the passenger with safety, it is equally true that the passenger is at the same time bound to take ordinary care of himself, and not act in a rash or foolish way, so as to lead to an accident. Before railways and canals were in use, it was sometimes doubted whether it was not the duty of carriers by coach to carry all persons who presented themselves and offered to pay their fare; but this notion is exploded, and even railway companies are not bound to carry everybody who comes, but merely to give reasonable accommodation to the ordinary number, otherwise their liability would be enormous on particular occasions where crowds assemble. Their interest is usually a sufficient inducement on such occasions to provide the accommodation required. A passenger has a right to carry along with him Luggage (q. v.).

In the case of passengers by sea, a peculiar code has been constructed, owing to the peculiarity of their situation. The fundamental rule of the common law is the same as on land carriage—that the carrier by sea does not engage to carry with absolute safety, but merely to omit nothing in his power, and to use due care. The legislature, however, has passed statutes to regulate the duties of carriers by sea, the latest being 13 and 19 Vict. c. 119. The act, however, only applies to voyages from the United Kingdom to places out of Europe, and not to the Mediterranean Sea. Payment of the passage money must be made before commencing the voyage, and the owners are not bound to forward steerage passengers by the very ship contracted for, if an equally eligible ship be offered, provided, however, that families are not to be separated. If the ship is disabled on the voyage, the owners are bound to repair the ship in six weeks, or send on the passengers. If the passengers exceed 300, a medical practitioner must be on board, and the provisions must be according to a certain scale of diet. The Emigration Commissioners require to inspect emigrant ships, and to give a certificate as to fitness. As to passenger steamers in Great Britain, a certificate is required from the Board of Trade, specifying the voyage and number of passengers allowed to be carried.

PA'SSERINE BIRDS. See **INSESSORES**.

PASSING-BELL, a bell tolled during the death agony of a dying person, at the moment of the soul's 'passing' from earth to its eternal abode. Its use in Catholic countries is to invite the hearers to join in the prayers which are ordered 'for the dying in their hour of agony,' and which the priest with his attendants recites in the death chamber. See **BELL**.

PASSING-NOTES, in Music. In passing from one chord to another, an intervening note, not belonging to either chord, may be used to assist the progression. Such a note is called a passing-note or

note of transition, as the notes D and F in the upper part of the subjoined example :

crucifixes, statues, and other sacred representations are veiled during the whole of Passion-tide.

PASSIVE TITLE, in the Law of Scotland, is the liability of an heir, or one who represents and interferes with the estate of a deceased person, to pay all the debts of the deceased. It was considered that so great an opportunity of fraud in secreting the goods of a deceased person existed, that the heir was presumed to be liable for all the debts of the deceased, unless he took good care to give up an inventory, and so shew what property there was. The barbarous doctrine of holding an heir universally liable has latterly been much restricted; but the explanation is entirely technical.

PASSOVER (*Pesach*, *Pascha*), the first and greatest of the three annual feasts (*Regalim*) instituted by Moses, at which it was incumbent upon every male Israelite to make a pilgrimage to the house of the Lord. It was celebrated on the anniversary of the Exodus from Egypt—i.e., on the 14th day of Nisan, otherwise called Abib, the period of the first full moon in the spring—and lasted eight days. In commemoration of the incidents connected with the great event of the liberation of the people, it was ordained that unleavened bread only should be eaten during this festive period, whence it also bore the name *Chag hamasoth* (Feast of Unleavened Bread); and, further, that a lamb one year old, and free from all blemish, roasted whole, together with bitter herbs, should form the meal in every house on the eve of the feast. Prayers and thanksgivings, all with a reference to the redemption from bondage, accompanied the repast, at which the members of the family or families who had joined in the purchase of the lamb had to appear in travelling garb. At a later period, a certain number of cups of red wine were superadded to this meal, to which, as its special ceremonies and the order of its benedictions were fixed, the name *Seder* (arrangement) was given. The name P. was more strictly limited to the first day, in which the paschal lamb was entirely consumed, the reserving of any part of it to the next day being expressly forbidden (Ex. xii. 10); and the name Feast of Unleavened Bread belonged rather to the remaining days, on which other animal food was eaten; but the names were often used indiscriminately.

The P. is generally regarded by Christian theologians as at once a sacrifice and a sacrament, and in the former character as an eminent type of the sacrifice of Christ. The death of Christ at the very time of the P. is regarded as corroborative of this view, which is indeed plainly adopted in certain passages of the New Testament, as John xix. 36, and 1 Cor. v. 7, in which last place our Saviour is designated 'Christ our Passover.' The P. is regarded as typical of Christ, in its connection with the deliverance of Israel from the bondage of Egypt, held to typify our salvation from the bondage of sin; in its being a sacrifice, and that of a lamb without blemish—the perfection of the paschal lamb, as of the other sacrificial victims, being supposed to signify the perfection of the great sacrifice; and in many other minor particulars, of which one is that referred to in John xix. 36, that no bone of the paschal lamb was to be broken.

The Paschal meal, as at present celebrated among the Jews, has more the character of a hallowed family-feast, with reference, however, to the great national event. The greater part of those—it may be added here—who live out of the Holy Land celebrate it on the two first evenings, as, owing to the uncertainty prevalent at one time with respect to the fixing of the new moon by the Sanhedrim at

Jerusalem, it was ordained that the 'Exiles' should celebrate all their festivals—except the Day of Atonement—on two successive days, a law still in force among the orthodox. The regulations of the 'lamb for each house,' the travelling garb, &c., are abrogated, but many further symbolical tokens have been superadded; reminiscences, as it were, both of the liberation from Egypt, and the subsequent downfall of the sanctuary and empire. The order of prayers and songs to be recited on these evenings has also received many additions, and even medieval German songs have crept in, as supposed to contain a symbolical reference to the ultimate fate of Israel. See *HAGGADA* (*shel Pesach*), *FESTIVALS*, *EASTER*, *LORD'S SUPPER*.

PASSPORT, a warrant of protection and permission to travel, granted by the proper authority, to persons moving from place to place. Every independent state has the right to exclude whom it pleases from its territory, and may require that all strangers entering it be furnished with properly authenticated documents, shewing who they are, and for what purpose they are visiting the country. Passports are sometimes issued by the ministers and consuls of the country which the traveller intends to visit, which cannot, however, be done without the consent or connivance of the state of which the holder of the instrument is a subject; they properly proceed from the authorities of the state to which the traveller belongs, and ought to bear the *visa* or countersignature of the minister or consul of the country which he is about to visit. In many European states no one is allowed to go abroad without a passport from his government authorising him to leave the country—a provision used as a means of detaining persons charged with crime. In some states, passports are even required by the natives to enable them to go from place to place in their own country. The regulations of different states have varied much regarding the use of passports; and of late years the general tendency has been to relax the stringency of the regulations connected with them. Since the facilities of travelling have so greatly increased, it seems to have become the prevalent opinion that the passport system tends to obstruct the free intercourse that is desirable between citizens of different countries; while it is ineffectual to prevent the entrance of dangerous or suspicious characters, who can obtain passports on false pretences, or make their way in without them. Within the United Kingdom no passports are required; but for a British subject travelling in many parts of the continent, they are requisite. Till of late years, the greater part of British subjects travelling abroad used to be furnished with passports from the ministers or consuls of the countries which they purposed to visit; the lord provost of Edinburgh was also in the way of issuing passports to Scotchmen. Of late years the passport most used by British subjects is that of the British Secretary of State for Foreign Affairs, which is now granted to any British subject on application of a banking company in the United Kingdom, or on the recommendation of the chief magistrate of any corporate town in the United Kingdom, or of any magistrate or justice of the peace, physician, surgeon, solicitor, notary, or minister of religion, who shall certify that the applicant is the person that he professes to be. If the applicant be a naturalised British subject, he must be known to the Foreign Secretary, or recommended to him by some person known to him, and his certificate of naturalisation must be forwarded to the Foreign Office. A Foreign Office passport must, as a general rule, be countersigned by the minister or consul of each country which the

holder means to visit. The passport is good for life; the visas only for a year. Since January 1861, British subjects have been admitted from England into France, and allowed to travel in that country without passport, on merely declaring their nationality; but that exemption does not seem to apply when France is entered from another side than the Channel. In Belgium, Holland, Norway, Sweden, Italy, and, according to the most recent regulations, also in Prussia, passports are not asked for. In Austria, the passport has to be shewn and countersigned by the police authorities at the frontier; but except in some of the garrison towns, it is hardly ever asked for in the interior. In many of the smaller German states, any person meaning to remain in a town above twenty-four hours must send his passport to the police-office, and obtain a permission to reside. Till lately, throughout the greater part of Europe, a traveller was liable to be called on to produce his passport, not only at every frontier town, but at every garrison town through which he passed, the ceremony of countersignature by the police being repeated each time. This was more especially the case in Italy, where the visas were attended with perpetual delays, annoyances, and demands on the traveller's purse.

Citizens of the United States can obtain passports from the office of the Secretary of State at Washington, or of the American Minister at London.

In time of war, passports or safe-conducts are granted by the supreme authority on the spot—i. e., the officer in command—to insure safety to the holders when passing from spot to spot, or while occupied in the performance of some act specified in and permitted by the passport. Passports may be granted for goods as well as individuals; and, in time of war, the passport of a ship is the formal voucher of its neutral character. It purports to be a requisition on the part of the government of a state to allow the vessel to pass freely with her company, passengers, goods, and merchandise, without hinderance, seizure, or molestation, as being owned by citizens or subjects of such state.

PASSY, a town of France, in the department of Seine, a suburb of Paris, and included within the fortifications of that city. See PARIS.

PASTA, GIUDITTA (JUDITH), one of the most distinguished opera singers of modern times, was born near Milan in Italy in 1793, and received her musical education partly at Como, under the chapel-master of the cathedral there, and partly in the conservatoire at Milan. After 1811 she appeared at various theatres of the second rank in Northern Italy, and obtained a respectable success, but did not give any particular indication of possessing more than average ability. Her first great triumph was achieved at Verona in 1822. The year following she was engaged at the Paris Italian Opera, where her singing excited great admiration. From this moment she laboured incessantly to reach the ideal perfection she had set before her mind. From 1825 to 1830 was the period of her most splendid triumphs, which were won principally in London and Paris. Vienna, where she accepted an engagement in 1832, witnessed the last. Some time afterwards she withdrew from the stage, and purchased a villa near Lake Como, where, and at Milan, she resided until her death in 1865. P. in her best days had a magnificent voice, which easily passed from clear shrill soprano notes to the gravest contralto tones. In addition she had a fine dramatic energy and stateliness of manner, that suited lofty and imposing characters. Her principal rôles were *Medea*, *Desdemona*, *Semiramide*, *La Sonnambula* (the opera of this name was written for her by Bellini), and *Giulia* in *Romeo e Giulia*.

PASTE, a term applied to various compositions in which there is just sufficient moisture to soften without liquefying the mass.

Common or adhesive paste is made by mixing wheat flour with cold water in the proportion of about two pounds to a gallon. The water is added by degrees, and well stirred in, so as to prevent lumpiness. About an ounce of powdered alum is sometimes added to increase its adhesiveness, and for shoemakers and bookbinders about an ounce and a half of finely-powdered rosin is substituted for the alum, which thickens it much and renders it much more tenacious. When the ingredients are thoroughly mixed, they are boiled, great care being taken to stir them thoroughly whilst boiling to prevent burning. This paste is used for a great variety of purposes, more especially by paper-hangers, bill-stickers, bookbinders, paste-board makers, &c. An adhesive paste, called *Chinese Paste*, is made by reducing to perfect dryness bullock's blood. It is then powdered and mixed with one tenth of its weight of finely-powdered quicklime. When used, it is mixed with water sufficient to form a paste, which is a strong cement for pottery, wood, stone, &c.

Fruit Paste is made by taking the juice of any fruit and dissolving in it an ounce to a pint of gum-arabic, or gum-senegal, which many prefer; then evaporate by a gentle heat until the liquid is as thick as syrup, and add to every pound of it a pound of finely-powdered refined sugar; continue the heat, and stir it until the sugar and juice are thoroughly incorporated, after which it is poured out on a marble slab slightly oiled. When cooled, it may be formed into lozenges for use. An imitation of this is made very generally by mixing three parts of citric acid, twenty-four parts of gum, and forty-eight parts of refined sugar, and dissolving the whole in water, and gently heating it to insure complete solution and mixture. It is then variously coloured and flavoured with any of the fruit essences. This paste is often sold under the name of jujubes, which were formerly lozenges of fruit paste prepared from the juice of the jujube fruit, *Zizyphus jujuba*.

Polishing Pastes vary according to the materials upon which they are to be employed. For brass, the best kind is a mixture of two parts of soft soap with four parts of rotten-stone in very fine powder. Another sort is eight parts of fine rotten-stone powder, two parts of oxalic acid powdered, three parts olive oil, and enough of turpentine to make them into a paste. For iron, a mixture of emery powder and lard is used; and for pewter a mixture of finely-powdered bath-brick and soft soap. For wood, a paste called furniture paste is made by adding spirit of turpentine to beeswax sufficient to form it into a soft paste, which is rubbed on thinly with a brush and woollen rag, and afterwards polished with a dry woollen cloth and soft brush.

Shaving pastes are very numerous, but the base of all is soap. The best of all is the true Naples soap (see SOAP), but it is often mixed with other ingredients according to the fancy of the vendor. For other applications of the word Paste, see GEME (IMITATION), and MACARONI.

PA'STEL, chalk mixed with other materials and various colours, and formed into pencils or crayons (q. v.).

PASTEL. See WOAD.

PA'STILE, PASTIL, or PASTILLE, a diminutive of paste. This term was originally applied to lozenges as little portions of confectionary paste, but it has been of late chiefly confined to a mixture of odorous materials, as in the case of the *fumigating*

pastilles, which are burned either as incense or as a means of diffusing an agreeable odour. They are composed of charcoal powder, with such aromatic gums as benzoin, labdanum, &c.; and powders of sweet-scented woods and barks, as sandal-wood, cinnamon, and especially cascarilla barks. Essential oils are also added, and the whole are worked into a paste with a little gum-mucilage, and formed into small sharp-pointed cones about an inch and a half high, and half an inch broad at the base. When perfectly dry, they are used by lighting at the point, and as they burn down an agreeable odour is given out with the smoke. Very tasteful vessels, called *pastille burners*, usually of porcelain, are made for using them. Another kind of *pastille*, usually in the form of a small pill covered with gold or silver leaf, is used for perfuming the breath; it is made of the same kind of ingredients, excepting the charcoal.

PA'STO, a town of the United States of Colombia, on a high plateau between two ridges of the Andes, 148 miles north-east of Quito. Height above sea-level upwards of 8500 feet. It is in the direct route from the Popayan Pass to Quito. Pop. about 7000.

PASTOR, a genus of birds of the Starling family (*Sturniæ*), differing from starlings in the compressed and slightly-curved bill. In habits, as in characters, they are very nearly allied to starlings. The name *P.* is supposed to be derived from their

Rose-coloured Pastor (*Pastor roseus*).

being frequently seen with flocks of sheep. The only European species is the ROSE-COLOURED P., or Rose-coloured Ouzel (*P. roseus*), a rare visitant of Britain and of the northern parts of Europe, and more common in the north of Africa, Syria, and India than in any part of Europe.

PASTORAL LETTER, a letter addressed either at certain stated times, or on the occurrence of some notable occasion, by a 'pastor,' but especially by a bishop to the clergy under his jurisdiction, to the laity of his flock, or to both. Of the former class, in the Church of Rome, are the so-called *Lenten Mandates*, or *Instructions*, issued before the commencement of Lent, and making known the regulations enacted for the observance of the *Lenten fast*, the dispensations granted, and the devotions and other pious works prescribed. Such also are the letters issued by a bishop on many of the chief festivals of the year. It is usual for bishops, besides their stated letters, to address to their clergy or people instructions suited to any particular emergency which may arise, and sometimes to take occasion from the issuing of the stated pastoral letter to offer instruction on some topic of importance which may engage public attention at the time, on some prevalent abuse or

scandal, or some apprehended danger to the faith or to morals. To this class belong many of the remains of the early fathers, especially in the Western Church. In some countries the government, as formerly in Austria, claimed a right to exercise a censorship over the pastoral letters to be issued by the bishops. This right, however, is regarded by churchmen as a usurpation, and although submitted to, is admitted only under protest. See *PLACETUM REGIUM*, *FERRONIANISM*.

PASTORAL POETRY is that kind of poetry which professes to delineate the scenery, sentiment, and incidents of shepherd-life. It is highly probable that the first attempts to give a rhythmic expression to human feeling were to some extent of this character. Men were originally shepherds, and their festal songs and hymns would derive at least substance and imagery from their primitive occupations; but as a distinct branch of poetic art, pastoral poetry was not cultivated till a comparatively late period; for although critics are fond of pointing to the lives of the Hebrew patriarchs, and to the story of Ruth, as specimens of the antiquity of the pastoral in the East, yet, as these profess to be history, and not fiction, they can be instanced only to prove that the material for this kind of poetry existed from the earliest ages. In point of fact, it was only after innocence and simplicity had passed away, or were thought to have passed away, from real life, that men began, half from fancy, and half from memory, to paint the manners of the past as artless, and the lives of their ancestors as constantly happy. It was thus the *Brass Age* that made the *Golden*. The oldest specimens of the classic pastoral are the *Idylls* of Theocritus (q. v.), which appeared about 275 B.C.—long after Greece had produced her masterpieces in epic narrative, in the war ode, and almost all other kinds of the lyric, in tragedy, comedy, history, philosophy, and rhetoric. Theocritus was imitated by Bion and Moschus, whose pastorals approximate in form to the drama. Among the Latins, the refined and courtly Virgil, in the reign of Augustus, wrote his *Bucolica* or *Eclogues*, on the model of his Greek predecessors; but, however beautiful and melodious the verses of these urban writers are, we cannot suppose for a moment that the rude shepherds and shepherdesses of Italy or Sicily indulged in such refined sentiments, or spent their time so poetically as there they are made to do. Virgil, we may rest assured, is as far from giving a genuine picture of pastoral life in his verse, as any modern poet who prates of *Chloe* and *Phyllis*.

During the middle ages, pastoral poetry in this artistic, and therefore conventional sense of the term, was almost unknown; but with the first glimpse of reviving classicism, the pastoral reappears. The earliest specimens are afforded by Boccaccio (q. v.), about the first modern Italian who studied Greek. It is to the countrymen of Boccaccio that we owe the creation of the pastoral drama, of which there is no trace in ancient literature. The *Favola di Orfeo* of Politian (q. v.), performed at the court of Mantua in 1483, is the first dramatic poem which pretends to represent the sentiments, incidents, and forms of pastoral life. Critics have forgotten this work when they make Tansillo the inventor of the *favola pastorale*, or *boscareccia*, on account of his *I due Pellegrini* (1539), or Agostino Beccari, whose pastoral comedy, *Il Sacrificio*, was played at Ferrara in 1554. However, it is true that the extraordinary popularity of Beccari's piece originated a crowd of *favole boscarecce*, the finest and most poetical of which is the *Aminta* of Tasso, represented at the court of Ferrara in 1572. A later, but hardly less famous production

is the *Pastor Fido* of Guarini (q.v.), published at Venice in 1590; and in the 18th c., the poet Metastasio (q.v.) revived for a moment the interest in this graceful and picturesque, but unreal branch of literature. In Spain, during the first part of the 16th c., it abundantly flourished. The first who wrote pastoral dialogues was Juan del Encina (cir. 1500); he was followed by Garcilaso de la Vega, and others. During the reign of the Emperor Charles V., one may say that Spanish imaginative literature was almost wholly of a bucolic character; but in Spain, as elsewhere, it took largely the form of prose-romance (see NOVELS) rather than of poetry, deriving its inspiration from the *Daphnis and Chloe* of Longus, the Byzantine romancist, not from the tuneful strains of the Mantuan swan. England, however, can boast of Spenser's *Shepherd's Calendar*, which is at least full of charming poetry, and is appropriately dedicated to Sir Philip Sidney, whose pastoral romance of *Arcadia* outstrips in point of literary beauty all other fictions of that class. The Germans reckon Shakspeare's *As You Like It* in the list of pastoral dramas; but its right to be so classified is by no means clear, although we may admit that it betrays the influence of the pastoral poetry and romance that had just ceased to be the rage among the scholarly geniuses of Europe. A similar influence is visible in the writings of other Elizabethan dramatists, as, for example, in the *Faithful Shepherdess* of Fletcher. In France, pastoral poetry is perhaps older than in any of the western nations. The comedy of Adam de Lehalle, surnamed Le Bossu d'Arras (The Hunchback of Arras), entitled *Le Jeu de Robin et Marion* (and which exists in MS. in the *Bibliothèque Nationale*), belongs to the middle of the 13th century. During the civil wars in the latter half of the 16th c., the pastoral was turned to political uses. In the following century, it continued for some time to be popular, or rather, let us say, fashionable. Even the great Richelieu alleviated the cares of office with the composition of *La Grande Pastorale*; but here, too, the poem soon gave way to the prose-romance, which was hardly less unreal, and far more exciting.

Perhaps the best pastoral, ancient or modern, is the *Gentle Shepherd* of Allan Ramsay (q.v.), published in 1725. 'It is,' says Mr Carruthers (Chambers's *Cyclopædia of English Literature*, vol. i., p. 601), 'a genuine picture of Scottish life, but of life passed in simple rural employments, apart from the guilt and fever of large towns, and reflecting only the pure and unsophisticated emotions of our nature. The affected sensibilities and feigned distresses of the Corydons and Delias find no place in Ramsay's clear and manly page. He drew his shepherds from the life, placed them in scenes which he actually saw, and made them speak the language which he every day heard—the free idiomatic speech of his native vales.' His English contemporaries, Pope, Ambrose Philips, Gay, and others, who form the 'Augustan,' or Queen Anne school of poets, also addicted themselves to the composition of pastoral poetry; but though there is much fine description in the verses, they are, in general, purely conventional performances, in imitation of the classic poets, who, as we have said, did not themselves imitate nature. From this censure, however, must be excepted the six pastorals of Gay, entitled the *Shepherd's Week*, which are full of honest country humour, and contain charming pictures of English country life. Since the early part of the 18th c., however, pastoral poetry, strictly so called, has ceased to be cultivated in England and almost everywhere else. In the pages of Wordsworth, who lived all his days among the

Cumberland shepherds, we indeed find many exquisite glimpses of pastoral life, as it presented itself to the profound and tender imagination of that great poet of nature, but few direct delineations of pastoral manners. Germany imitated abundantly the French and Italian models during the greater part of the 18th century. The last and best of the German series is the *Erwin and Elmire* of Goethe's youth. The general impression appears to be that the age of pastoral poetry has passed away forever, and that Damon and Chloe will never reappear in verse.

PASTORAL STAFF, sometimes also, although not properly, called CROSIER (q.v.) (Lat. *baculus pastoralis*), one of the insignia of the episcopal office, sometimes also borne by an abbot. It is a tall staff of metal, or of wood ornamented with metal, having, at least in the Western Church, the head curved in the form of a shepherd's crook, as a symbol of the pastoral office. The head of the pastoral staff of an archbishop, instead of the crook, has a double cross, from which its name of *crozier* is derived. In the Greek Church the staff is much shorter, and the head is either a plain Greek cross of the form of the letter Tau, or it is a double-headed crook, which sometimes appears in the shape of the upsilon, Υ . It is difficult to determine the time at which the pastoral staff first came into use. The first distinct allusion to it is in St Augustine's commentary on the 124th psalm. Gregory of Tours, in his life of St Martin, mentions the pastoral staff of St Severinus, who was Bishop of Cologne in the end of the 4th century. From an early time, the pastoral staff was connected with the actual possession of the jurisdiction which it symbolises. The giving of it was one of the ceremonies of investiture; its withdrawal was part of the form of deprivation; its voluntary abandonment accompanied the act of resignation; its being broken was the most solemn form of degradation. So also the veiling of the crook of an abbot's pastoral staff, during the episcopal visitation, signified the temporary subjection of his authority to that of the bishop. An abbot being required to carry his pastoral staff with the crook turned inwards, shewed that his authority was purely domestic. The pope alone does not use a pastoral staff. In the later medieval period the material was often extremely costly, and, referring to the relaxation of the times, it was said 'that formerly the church had wooden pastoral staves and golden bishops, but that now the staves are of gold and the bishops of wood.' The workmanship was sometimes extremely beautiful. We annex as a specimen of the highest art the pastoral staff of William of Wykeham, now in New College, Oxford. This is a sample of the Norman pastoral staff. The Saxon was by no means so tall. The Irish pastoral staff is of a type quite peculiar, and some of the sculptured specimens preserved in the British Museum, at the Royal Irish Academy, and elsewhere, are very interesting as illustrating the ecclesiastical costume of the period.

Pastoral Staff.

PASTORAL THEOLOGY, that branch of theological science which regards the duties and obligations of pastors in relation to the care of souls. It comprises two parts; first, that which treats of

the obligations of the pastors themselves, and which is therefore designed for the training and preparation of the candidates for the pastoral office. The other part of pastoral theology, which might perhaps better be called Popular Theology, comprises the objective teaching which is to be employed in the instruction and direction of the flock committed to the pastor's charge. This branch of theology has long formed a leading portion of the training of candidates in the Evangelical Churches of France and Germany; and a valuable manual for Catholic studies has recently appeared in Vienna, *Lehrbuch der Katholischen Pastoral*, von Dr A. Kerschhammer, 8vo, Wien, 1863.

PASTRY, articles of food in which the chief part consists of a paste made of flour. This would of course apply to bread, but it has been limited by custom to such lighter articles as are made by the pastry-cook, and chiefly to those in which the paste is made to assume a light flaky character by the addition of butter, &c., and by the mode of working it up. The commonest kind is made of a dough of flour and water, into which butter or lard is worked by hand, in the proportion of six ounces to the pound. The finest kind is usually termed *puff paste*, and considerable skill is required to make it well, for it depends, next to the goodness of the materials, upon lightness of hand in kneading the ingredients together. These ingredients consist of fine wheaten flour and butter in the proportion of four ounces of butter to a pound of flour, with cold water just sufficient to make a good stiff elastic dough; this is rolled out with a *rolling-pin*, and double the previous quantity of butter is then spread over it. It is then rolled up and lightly kneaded, so as to work the butter in thoroughly. Coolness is very important in making pastry; a marble slab is therefore most desirable for making it upon. The thinner it is rolled out before the butter is then spread the better, because when it is put in the oven the laminae which have been formed by folding or rolling up the butter with the dough, separate by the disengagement of the watery vapour, and the thinner and lighter the flakes are the better is the puff paste. Another kind is called *short paste*; in this the flour is made warm, and the butter or lard used is often melted, and a little sugar and an egg or two are added. This, when baked, has none of the flaky character of puff paste, but it is better adapted for meat and some other kinds of pies which require to be baked without a dish. Game pies, with elaborately-decorated crusts, are made of this pastry.

PASTURAGE, in English Law called Common of Pasture, is classed among rights of common or profits *à prendre*, and is the right of one who is not the owner of land to put his sheep or cattle on such land to feed there. In Scotland it is called a servitude of pasturage. In both countries the right can be established by prescription, in England of thirty years, and in Scotland of forty years. Where the parties entitled to pasturage dispute as to their respective proportions of cattle, the suit to redress the matter is called in Scotland an action of 'sowming and rowming.'

PASTURES (Lat. *pasco*, to feed) are fields or tracts of land devoted to the feeding of oxen, sheep, and other herbivorous animals, which eat the grass and other herbage as it grows. Grass is grown sometimes in the rotation with grain and other crops, when it remains on the ground for one or more years, is frequently mown during the first summer, and grazed afterwards, but is again ploughed up to be succeeded usually by oats or wheat. For such purposes, rye-grass, red, white, yellow, and *salike* clovers, are used either alone or mixed in

varying proportions. On the uplands of Great Britain, wherever from any cause grain crops cannot profitably be grown, and throughout many of the richest plains and valleys, especially of England and Ireland, there are thousands of acres of land which have been under grass from time immemorial. Such permanent pastures are estimated to occupy fully 14,000,000 acres in England, nearly 8,000,000 in Scotland, and about 9,000,000 in Ireland. Sometimes they have been self-sown, occasionally they have been laid down with care, seldom are they as highly cultivated and liberally managed as they should be. The best of them are used for feeding heavy bullocks; those of somewhat poorer description are often grazed by dairy stock; whilst the down or upland pastures are especially profitable for sheep. It has now become a common practice, and is every year becoming more and more general, to give additional food of various kinds to animals fed on pastures. Even cattle grazing on the richest pastures are supplied with linseed cake, &c., to hasten the process of fattening, and to improve their quality; roots are given to sheep when fattening for the market, and hay to those which are to be kept as stock; whilst when oats or beans are cheap, many sheep-farmers find it advantageous to give them even to the hardy stock of exposed hill-pastures. All pastures are much improved by thorough drainage. The application of farmyard dung, soil, lime, and almost every sort of top-dressing is beneficial. Irrigation is sometimes profitable, and in some other countries is far more common and far more requisite than in Britain. Rich pastures on which oxen are fed are injured by sheep, which reject the coarsest grass, and pick out the finest; but a few horses turned into them during the autumn or winter help to consume the coarser tufts. The coarsest and rankest grass may once or twice, a year be cut over by the scythe; and either made into rough hay, or if left on the ground, the cattle, when it has partially dried, will readily eat it up. A dressing of lime and salt scattered over the rougher parts of the fields in autumn will sweeten the herbage, and induce the stock to eat it down regularly. Moss, which is a great pest in many pastures, may be got rid of by penning sheep, well fed with swedes, cake, or corn, regularly over the field; or by harrowing the surface in several different directions during January or February, applying then a top-dressing of soil or dung, and in March or April sowing some clover or other seeds, which will be firmed down by the bush harrow, clod-crusher, or heavy roller. The droppings of the cattle ought to be broken up and scattered over the ground. Rich pastures intended for the fattening of cattle ought not to be used during winter, but allowed to become luxuriant before the cattle are turned upon them in spring. Very lean animals, whether oxen or sheep, cannot with advantage be at once placed on very rich pasture, but must be gradually fitted for it. In some of the hill districts of Scotland, devoted to sheep-farming, increased productiveness has resulted from breaking up portions of the pasture, and after two or three crops have been taken, laying them down as pastures again. All good pastures produce a very mixed herbage, not consisting merely of one kind of grass, but of several or many, with clovers and other plants. Different species of Meadow-grass (*Poa*), Fescue (*Festuca*), Foxtail (*Alopecurus*), Oat-grass (*Avena*), Cock's-foot (*Dactylis glomerata*), Rye-grass (*Lolium*), Hair-grass (*Aira*), Vernal-grass (*Anthoxanthum*), and Timothy or Cat's-tail (*Phleum*), are among the most common grasses of British pastures. Yarrow (*Achillea millefolium*) is very abundant in some

pastures, and is sometimes sown with grass, clover, &c., in land meant for permanent pasture. Different kinds of clover are adapted to different soils and situations. The presence of rushes is very indicative of the want of drainage. Thistles and docks are injurious, and are to be extirpated as much as possible. Some of the plants naturally abundant on high hill-pastures, as *Nardus stricta* and *Juncus bufonius*, are very unnutritious; and the substitution of others in their stead, is one of the benefits derived from the breaking up of such lands.

PATAGONIA, the most southern country of South America, bounded on the N. by the Argentine Republic, and the Rio Negro, which separates it from the Pampas (q. v.); on the N.W. by the Chilean territories; on the W. by the Pacific; on the S. by the Strait of Magellan, which separates it from Tierra del Fuego; and on the E. by the Atlantic. It lies in lat. 38° – 53° S.; and in long. 62° $40'$ – 75° $40'$ W. Length upwards of 1000 miles, greatest breadth about 480 miles; area about 350,000 square miles; estimated pop. 3000. If this estimate is correct, P. must be one of the most sparsely-peopled regions of the globe. The coast of the Atlantic is much broken by extensive bays and inlets, none of which, however, are of much importance or advantage, in a commercial point of view. Along the western coast, and stretching from 42° S. to the Strait of Magellan, are numerous islands, with precipitous shores, belonging apparently to the system of the Cordilleras. The principal islands are Chiloé, the Chonos Archipelago (q. v.), Wellington Island, the Archipelago of Madre de Dios, Queen Adelaide's Archipelago, and Desolation Island. These islands—which, together with several peninsulas, form a coast almost as rugged as that of Norway—are mountainous; but in none of them, except in Desolation Island, do the mountains rise to the snow-line.

Surface, Soil, &c.—The country of P. divides itself into two regions, very unequal in size and very different in character. These are Eastern and Western P., which are divided by the great mountain range of the Andes. Western P., comprising this range, the coast districts, and the islands, is rugged and mountainous. Opposite the island of Chiloé are two active volcanoes, one of which, Minchinmavida, is 8000 feet high. The slope of the country from the Andes to the Pacific is so steep, and the strip of shore so narrow, that the largest river of this district has its origin only about 13 miles from its embouchure on the coast. In the island of Chiloé, in the north of Western P., the mean temperature of winter is about 40° , that of summer rather above 50° ; while at Port Famine, in the extreme south of this region, and 800 miles nearer antarctic latitudes than Chiloé, the mean temperature is not much lower, being in winter about 33° , and in summer about 50° . This unusually small difference in the mean temperature of the extremes of Western P., which extends over about 14° of lat., is due to the great dampness of the atmosphere all along the coast. The prevailing winds of this region blow from the west; and, heavily surcharged with the moisture they have drawn from the immense wastes of the Pacific Ocean, they strike against the Andes, are thoroughly condensed by the cold high mountains, and fall in rains that are almost perpetual from Chiloé to the Strait of Magellan. South of 47° S. lat., hardly a day passes without a fall of rain, snow, or sleet. This continual dampness has produced forests of almost tropical luxuriance. A kind of deer wanders on the east side of the mountains; pumas and water-fowl are met with; and, along the coast, seals, otters, sea-elephants, fish, and shell-fish are found.

Eastern P., often called *the plains*, comprises by far the larger portion of P., and extends eastward from the Andes to the Atlantic. Its surface has not yet been thoroughly explored, and is described only in the most general terms. According to all accounts written previously to the year 1864, Eastern P., from its northern to its southern limits, is an immense, stony, shingly waste, generally level, but gradually rising in terraced steppes from the Atlantic to the Cordilleras. The elevation of the highest of these terraces is about 3000 feet. The surface is covered with stones and pebbles, mixed with earth of a whitish colour, overlying great masses of porphyry, and strewn with immense boulders. Thorny brushwood, tufts of coarse brown grass, and, toward the west, basaltic ridges, break the dead level of the dreary landscape. The soil is strongly impregnated with saltpetre. Salt lakes of every variety of extent and level abound. Many of these lakes are surrounded by a brilliant snow-white crust; the waters of some of them are cold in summer and hot in winter, while in others the waters are poisonous. Extending along the south coast for several hundred miles, there is a great deposit of tertiary strata, underlying a stratum of a white pumaceous substance, a tenth part of which is marine infusoria. Sea-shells are scattered everywhere across the country, and salt is everywhere abundant, from which circumstances it has been inferred that this tract was once a sea-bottom. The air of Eastern P. is generally dry and hot, deriving no moisture from the prevailing west winds, which pass over the plains after having been drained by the Andes. Hurricanes, however, cutting and frigid, sweep over the plains with great fury, stripping the hides from the roofs of the *roukhs* or huts, and paralysing the inhabitants with cold and with fear. The above account, though in general correct, must be supplemented as well as modified by a few facts as to the surface from one who recently lived for three years in P. and its vicinity. According to M. Guinnard, the country along the banks of the Rio Negro is for the most part mountainous, and is intersected by deep ravines; but it is not, as has hitherto been believed, completely sterile, for, on the contrary, the escarped banks of the river are sometimes abundantly fertile. The same traveller further estimates that one-third of the entire area of this country—which has hitherto been described as barren—is of great fertility, especially the regions on the east coast and on the Strait of Magellan in the south. Along the eastern base of the Andes also, the great tract of territory called *Los Serranos* is astonishingly picturesque and fertile. Here great forests abound, to which the Indians retire for shelter from the freezing winds of winter. There are also deep valleys furrowed by mountain torrents; and numerous lakes, the haunts of wild-duck and other water-fowl which would delight the European sportsman, but which are never disturbed by the Indians, and are almost as tame as barn-yard fowls. Except pasture, Eastern P. has no productions. However fertile the soil in some places may be, it is nowhere cultivated. The Indians live upon the produce of the chase alone, and seem to desire no better sustenance. The principal rivers are the Rio Negro (q. v.); the Chupat, which flows through a good soil, producing excellent pasture and good firewood; and the Santa Cruz, which flows through a barren district, in a valley from one to five miles wide, and 1400 feet below the level of the plain. All these rivers rise in the Andes; the Chupat flows east, and the others south-east. Herds of horses are reared, dogs abound, and in the more favoured regions, cattle are bred; pumas and foxes are met with, as well as condors, hawks,

partridges, and water-fowl in Los Serranos. But by far the most important animals are the guanaco (wild llama), the nandou (Patagonian ostrich), and the gama, a kind of deer.

Inhabitants.—The Patagonians have been hitherto described only in the most general terms, and in many cases very inaccurately. Little was known of their appearance, habits, and employments. Recent information, however, enables us definitively to class the Patagonian monster of the early voyagers with Gulliver's giants. The tallest of the tribes are composed of men who, on an average, are nearly six feet in height; while in other tribes the average height is an inch or two less. There is reason to believe, however, that instances of unusual height are as rare in P. as in Europe. The peculiar costume of the Patagonians, which in most instances consists of a long mantle of hide, drooping with unbroken outline from their shoulders almost to the ground, gives them the appearance of extraordinary height. Many of the tribes also are large in body, while they have comparatively short extremities; and these, when seen on horseback, covered with their long mantles, seem almost gigantic in stature. Their colour is a reddish brown. Their shoulders are large, and well thrown back; the chest is well expanded; the head large, the forehead open and prominent; the mouth large; the eyes black, and generally large; the nose frequently hooked, long, and thin, though among some tribes it is, as a rule, broad at the nostrils; the ears are large, and elongated by the heavy ornaments of their own manufacture which they wear in them, and which are so large that they often rest on the shoulders. The hair, generally black, coarse, and lank, is sometimes rolled together on the top of the head. Their houses, called *roukahs*, are formed of three rows of stakes driven into the ground. The middle row is higher than the others, and the three rows are tied together with strings of hide, and so kept in their place. This frail framework is covered with hides which reach the ground on all sides, and are fastened to it by small stakes of bone. At nightfall, guanaco hides are spread on the ground within the tents, and the men and women laying aside their mantle, their only garment, and which sometimes serves as a blanket, go to sleep under the same roof and in the same apartment. Bathing in cold water every morning, throughout the whole year, is a custom to which men, women, and children conform; and although the morning bath may not free them from vermin—a national characteristic—yet it has the effect of preventing disease, and of enabling them the more easily to endure the severities of winter. The men, when out on the hunt, shew wonderful courage and adroitness; when not so engaged, they live in perfect idleness. They are incredibly greedy and voracious. They deck their heads, and ornament them into the perfection of ugliness, greasing their hair with the grease of the horse. They pull out the hair of the eyebrows and beard, and paint their bodies with black, red, and other colours. The Patagonians are nomads; some of the tribes, however, as the *Puelches*, are nomads from choice, not from necessity, for their district or headquarters is abundantly fertile. The more important tribes are nine in number; and each tribe is led and governed by a cacique, whose power extends also to numerous sub-tribes. Each family and each man, however, is entirely free, and can remain attached to a certain tribe or separate from it at pleasure. The Patagonians form themselves into these communities for the purpose of self-defence. Wars are so frequent that security is found only in union. The chiefs are considered as the fathers, the leaders, and the rulers of the tribe; and are selected

chiefly on account of their bravery in battle. The more powerful tribes frequently make raids upon settlements, and carry off great numbers of horses and cattle. They subsist upon the flesh of horses, nandous, gamas, and guanacos; the flesh they eat is generally raw. Their choice morsels are the liver, the lungs, and the raw kidneys, which they prefer to eat dished in the warm blood of the animal, or in curdled milk seasoned with salt. Roots and fishes are also eaten, but raw flesh is the staple. They are hospitable among themselves, though bitterly hostile to Christians. Their only manufactures are mantles of guanaco hide, and saddles, bridles, stirrups, and lassos. The lassos and the articles of harness are chiefly plaited, and evince wonderful ingenuity and nicety of execution. The mantles are made for the most part by a tribe called the *Tcheouelches*. They are mainly made by women, who first in a rude and primitive manner tan the leather, then put the hides together, and sew them with the small sinews of the animal itself. Afterwards the men rub them with a stone for the purpose of supplying them and flattening the seams, and then ornament them with capricious designs in red and black paint. The Indians obtain a few cattle and horses in exchange for these mantles, which are no less prized by neighbouring tribes than they are by the Hispano-Americans. Clothed in one of them, the natives expose themselves to the most intense cold without receiving any injury.

The religion of the Patagonians is dualistic. They believe in two gods or superior beings—the God of Good and the God of Evil; or, in their own language, *Vita Ouënetrou*—the Great Man, and *Honacowou* or *Gualetchou*—the Cause of Evils. The former they consider the creator of all things, and they believe that he sends the sun to them as his representative, as much to examine what takes place among them, as to warm their bodies and renew the brief spring verdure. The moon is another representative, whose office it is to watch them and give them light. Believing that they themselves require a great deal of 'watching,' they further believe that every country on the globe has its own sun and moon, or special watchers. They have no idols. Their faith is transmitted from father to son, and its observances are strictly attended to. They are full of strange superstitions. They dread the north and the south, believing that from the south come evil spirits, who take possession of the souls of the dying, and bear them off to the north. They consider that the best means of ensuring a long life is to go to sleep with the head lying either to the east or to the west. They also believe that all natural phenomena have their causes in their own conduct, and that all misfortunes are sent as punishments due to moral delinquencies. Thus, the fearful tempests that sweep over their plains inspire them with the greatest dread. During the prevalence of the hurricane, they crouch together in their huts; fear makes them inactive, and they do not stir from their grovelling position even to cover themselves with the hides which the tempest strips from their huts. The Patagonian never eats or drinks without turning to the sun, and throwing down before him a scrap of meat or a few drops of water, and using a form of invocation. This form of invocation is not fixed, but it hardly ever varies, and is to the following effect: 'O Father, Great Man, king of this earth! give me favour, dear friend, day by day; good food, good drink, good sleep; I am poor myself, are you hungry? Here is a poor scrap; eat if you wish.' The Patagonians observe two great religious fêtes—one in summer, in honour of the Benevolent Deity; and another in autumn, in honour of the God

of Evil. On the occasion of these fêtes, the Indians assemble on horseback, dressed in the most ceremonious manner, with their hair newly greased, and their bodies freshly painted. On such occasions, it is customary to wear whatever vestments they may have obtained either in war or by stealth from civilised men; and a Patagonian chief may be seen wearing above his mantle of hide the shirt of the European, or casing his legs in a pair of pantaloons. The Patagonians are much given to gambling and to drinking. [By treaty concluded between the Argentine Republic and Chili in 1881, the territory of P. was apportioned between those governments, the crest of the eastern ridge of the Andes forming the dividing-line between their respective portions.]

PĀTĀLA (from *pat*, fall) is, in Hindu Mythology, the name of those inferior regions which have seven, or, according to some, eight divisions, each extending downwards ten thousand *yojanas*, or miles. The soil of these regions, as the *Vishn'u-Purān'a* relates, is severally white, black, purple, yellow, sandy, stony, and of gold; they are embellished with magnificent palaces, in which dwell numerous *Dānavas*, *Daityas*, *Yakshas*, and great snake-gods, decorated with brilliant jewels, and happy in the enjoyment of delicious viands and strong wines. There are in these regions beautiful groves, and streams and lakes, where the lotus blows, and the skies are resonant with the *kokila's* songs. They are, in short, so delightful, that the saint *Narada*, after his return from them to heaven, declared among the celestials that P. was much more delightful than *Indra's* heaven. Professor Wilson, in his *Vishn'u-Purān'a*, says 'that there is no very copious description of Pātāla in any of the *Purān'as*; that the most circumstantial are those of the *Vāyu* and *Bhāgavata Purān'as*; and that the *Mahābhārata* and these two *Purān'as* assign different divisions to the *Dānavas*, *Daityas*, and *Nāgas*. . . . The regions of the Pātāla and their inhabitants are oftener the subjects of profane than of sacred fiction, in consequence of the frequent intercourse between mortal heroes and the serpent-maids. A considerable section of the *Vṛ'ihat-Kathā* consists of adventures and events in this subterraneous world.' For inferior regions of a different description, see **NARAKA**.

PATANJALI is the name of two celebrated authors of ancient India, who are generally looked upon as the same personage, but apparently for no other reason than that they bear the same name. The one is the author of the system of philosophy called *Yoga* (q. v.), the other the great critic of *Kātyāyana* (q. v.) and *Pān'ini* (q. v.). Of the former, nothing is known beyond his work—for which see the article **YOGA**. The few historical facts relating to the latter, as at present ascertained, may be gathered from his great work, the *Mahābhāshya*, or 'the great commentary.' The name of his mother was *Gon'ikā*; his birthplace was *Gonarda*, situated in the east of India, and he resided temporarily in *Cashmere*, where his work was especially patronised. From circumstantial evidence, Professor Goldstücker has, moreover, proved that he wrote between 140 and 120 B. C. (*Pān'ini, his Place in Sanscrit Literature*, p. 235, ff.). The *Mahābhāshya* of P. is not a full commentary on *Pān'ini*, but, with a few exceptions, only a commentary on the *Vārttikas*, or critical remarks of *Kātyāyana* on *Pān'ini*. 'Its method is analogous to that of other classical commentaries: it establishes, usually by repetition, the correct reading of the text, in explaining every important or doubtful word, in shewing the connection of the principal parts of the sentence, and in adding such observations as may be required for a

better understanding of the author. But frequently *Patanjali* also attaches his own critical remarks to the emendations of *Kātyāyana*, often in support of the views of the latter, but not seldom, too, in order to refute his criticisms, and to defend *Pān'ini*; while, again, at other times, he completes the statement of one of them by his own additional rules.' P. being the third of the grammatical triad of India (see *PĀN'INI*), and his work, therefore, having the advantage of profiting by the scholarship of his predecessors, he is looked upon as a paramount authority in all matters relating to classical Sanscrit grammar; and very justly so, for as to learning, ingenuity, and conscientiousness, there is no grammatical author of India who can be held superior to him. The *Mahābhāshya* has been commented upon by *Kaiyyatā*, in a work called the *Bhāshya-Pradīpa*; and the latter has been annotated by *Nagajibhatta*, in a work called the *Bhāshya-pradīpodyota*. So much of these three latter works as relates to the first chapter of the first book of *Pān'ini*, together with the *Vārttikas* connected with them, has been edited at *Mirzapore*, 1856, by the late Dr J. R. Ballantyne, who also gave a valuable literal translation of the first forty pages of the text.

PATA/PSCO, a river of Maryland, U.S., rises on the northern boundary of the state, and flows southeasterly 80 miles to the Chesapeake Bay, 14 miles south of Baltimore, to which city it is navigable. Its falls furnish water-power to numerous factories.

PATCHOULI. This very interesting material is the dried branches of *Pogostemon Patchouli* (natural order *Labiatae*), which was first introduced to this country as an article of merchandise in 1844. The plant is a native of *Silhet*, the Malay coast, *Ceylon*, *Java*, the neighbourhood of *Bombay*, and probably also of *China*; but owing to the fondness of Asiatics for the perfume which it yields, it is difficult to say where it is native or cultivated. Every part of the plant is odoriferous, but the younger portions of the branches with the leaves are chosen; they are usually about a foot long. The odour is peculiar and difficult to define, but it has a slight resemblance to sandal-wood; it is very powerful, and to many persons is extremely disagreeable. The odour of patchouli was known in Europe before the material itself was introduced, in consequence of its use in *Cashmere* to scent the shawls with a view of keeping out moths, which are averse to it; hence the genuine *Cashmere* shawls were known by their scent, until the French found the secret, and imported the herb for use in the same way. Its name in India is *Pucha-pat*, and it is there used as an ingredient in fancy tobaccoes, and as a perfume for the hair. It is also much prized for keeping insects from linen and woollen articles. The essence of patchouli is a peculiar heavy brown oil, with a disagreeably powerful odour; it is obtained by distillation, and requires extreme dilution for perfumery purposes.

PATE/LLA, or **KNEE-CAP**, is a *Sesamoid Bone* (q. v.), developed in the single tendon of the *rectus, vastus externus*, and *vastus internus* muscles—the greater extensor muscles of the leg. It is heart-shaped in form, the broad end being directed upwards, and the apex downwards. The anterior or external surface is convex, perforated by small apertures for the entrance of vessels, and marked by rough longitudinal striae, while the posterior or internal surface is smooth and divided into two facets by a vertical ridge, which corresponds and fits into the groove on the lower articulating surface of the femur or thigh-bone, while the two facets (of

which the outer is the broader and deeper) correspond to the articular surface of the two condyles.

This bone is liable both to dislocation and fracture.

Fig. 1.—Posterior surface of right Patella.

1, outer facet; 2, inner facet; 3, surface to which the ligamentum patellæ is attached.

except in one rare variety, the dislocation is capable of being reduced without any difficulty. Fracture of the patella may (like dislocation) be caused either by muscular action or by mechanical violence.

Fracture by muscular action is the more common of the two forms, and occurs thus: A person in danger of falling forwards, attempts to recover himself by throwing the body backwards, and the violent action of the extensors (chiefly the *rectus*) snaps the patella across, the upper fragment being drawn up the thigh, while the lower portion is retained *in situ* by that portion of the common tendon which is continued from the patella to the tubercle of the tibia, and which is called the ligamentum patellæ. The treatment consists in relaxing the opposing muscles by raising the trunk, and slightly elevating the limb, which should be kept in a straight position. In consequence of the great difficulty of bringing the broken surfaces into exact apposition, as may be readily understood from the accompanying figure, it is very difficult to obtain bony

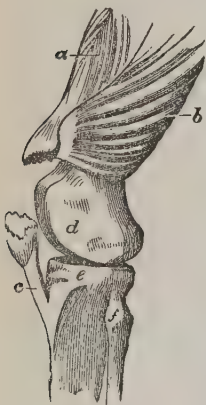

Fig. 2.

reunion of the parts, and the case generally results either in mere ligamentous union or in no true union at all.

PATELLA and PATELLIDÆ. See LIMPET.

PATEN (Lat. *patina*, a dish), the plate employed for the elements of bread in the Eucharistic service. Anciently it was of considerable size; and while the practice of the OFFERTORY (q. v.) continued, there was a special paten for the bread-offering. In the Roman Catholic Church, in which the unleavened wafer-bread is used, and the communion is distributed from a distinct vessel called Pyx (q. v.), the paten is a small circular plate, always of the same material with the chalice. It is often richly chased or carved, and studded with precious stones. It is used only in the mass.

PATENT is an exclusive right granted by the government (in letters *patent* or open, whence the name) to an individual to manufacture and sell a chattel or

article of commerce of his own invention. The present law allows the inventor to have a monopoly of his invention for seventeen years, without a further privilege at the end of that time. The evils of the present law are that there is a great deal of uncertainty in the mode of ascertaining what is a new invention. Hence, when a patent has been granted, if it is of such a nature as to lead to competition, infringements are almost matters of course, and the only mode of discovering and checking the infringement is so tedious, costly, and ineffective, that inventors generally pass their lives in constant litigation, fighting in detail a succession of imitators who often have nothing to lose by defeat, and therefore entail all the greater burden on the legitimate manufacturer. It has been said that not more than three patents per cent. are remunerative.

All the business connected with British patents is now transacted at the office in London. The commissioners of patents are the Lord Chancellor, Master of the Rolls, Attorney and Solicitor General of England and Ireland, and the Lord Advocate and Solicitor General of Scotland. The mode in which an inventor proceeds, is, first to present a petition for a grant of letters-patent, accompanied by a statement in writing of the specification, a copy of which must be left at the patent-office. These papers, as also drawings, must be in a certain prescribed form, and are laid before one of the law officers of the crown, who may call to his aid a scientific person to be paid by the applicant. A provisional patent may be applied for in the first instance, and the complete patent deferred for six months—an arrangement which gives the benefit of priority to the applicant of time to prepare and test his specification, and of paying the expenses more gradually; but the effect is the same in the end, the patent dating from the first application. After a patent has been granted, and been in existence for three years, a fee of £50 must be paid; and, at the end of the seven years, a fee of £100. The letters-patent extend to the whole of the United Kingdom.

In France, patents are granted for the term of 5, 10, or 15 years, at the option of the applicant; in Prussia, for 15 years; in Russia, for 3, 5, or 10 years; in Spain, for 5, 10, or 15 years; in Belgium, for 20 years; in Holland, for 5, 10, or 15 years; in Austria, for not more than 15 years; in Italy, for 15 years. In all cases, fees are exigible from the patentee.

The only law in force in the U. States relating to patents for inventions, &c., was approved July 8, 1870, and enacts that any person, whether citizen or alien, being the original inventor or discoverer of any new and useful art, machine, manufacture or composition of matter, or any new and useful improvement thereof, may obtain a patent for the term of seventeen years for his invention or discovery, provided the whole or any part of what he claims as new has not been already patented or described in a printed publication in this or any foreign country, or been invented or discovered in this country, and if he has not abandoned his invention to the public, or if it has not been in public use or on sale for more than two years previous to his application. Every discovery is not deemed patentable, and a philosophical principle or elementary truth in science cannot be made the subject of a patent, unless applied to some directly useful purpose. Merely conceiving the idea of an improvement or machine is not an invention or discovery. The invention must be reduced to a practical form, either by the construction of the machine itself or of a model thereof, or by making a drawing of it, or by such disclosure of its exact character as that a mechanic can and does from the description given construct the improvement or a model thereof, before it will prevent a subsequent inventor from obtaining a patent.

Application for a patent must be completed and prepared for examination within two years after filing

the petition, must be made by the actual inventor, if alive, or by his executor or assignee, if deceased, and a fee of fifteen dollars paid. A specification must be presented setting forth the manner of constructing, compounding, and using the invention or discovery. It must state what the inventor claims, describe the drawings, machine, composition, or improvement, and he must make oath or affirmation that he does verily believe himself to be the original inventor, &c.; that he does not believe it was ever before known or used. The drawings or models must be prepared of certain dimensions, after a certain manner, as described by the rules of the Patent Office, to be submitted to the examiner of the office. If his claim be rejected for want of novelty, he may file a formal renewal with or without amendment, or, if again rejected, may appeal to the board of examiners in chief, having once paid a fee of ten dollars; and, if needful, may appeal again to the commissioner in person upon the payment of a fee of twenty dollars; and, if dissatisfied with his decision, may appeal to the Supreme Court of the District of Columbia sitting in banc.

A commissioner may extend a patent granted prior to March 2, 1861, to seven years from the expiration of the original term, but no patent granted since March 2, 1861, can be extended. The applicant for an extension must file his petition and pay the requisite fee not more than six months nor less than ninety days prior to the expiration of his patent. No patent can be renewed after it has once expired.

The taking out of a patent in a foreign country does not prejudice a patent previously obtained here, nor does it prevent obtaining a patent here subsequently, unless the invention shall have been introduced into public use in the United States for more than two years prior to the application. The U. S. patent must, however, expire at the same time with the foreign patent, and in no case can it be in force more than seventeen years.

Caveats.—Any citizen of the United States, or alien who has resided for one year in the United States, and has made oath of his intention to become a citizen thereof, claiming to be the original inventor, &c., can file a caveat in the secret archives of the Patent Office on the payment of a fee of ten dollars therefor. By so doing the caveator will be entitled to notice to file his application and contest the priority of his invention with any other person claiming the same invention.

Designs.—Any new and original design for the printing of textile fabrics, and ornament, print, or picture printed or cast, &c., or any new, useful, and original shape or configuration of any manufactured article not known or used by others, or patented or described in any printed publication, may be made the subject of a patent to any person, whether citizen or alien, for 3½, for 7, or for 14 years, as the said applicant may elect, upon the payment of fees of ten, fifteen, or twenty dollars respectively. If granted prior to March 2, 1861, they may be extended 7 years in the same manner as patents for inventions. Lawful trade-marks may also be recorded in the Patent Office, and the exclusive use will be secured to the party having a right thereto for a term of thirty years on the payment of twenty-five dollars. This may be renewed, on certain conditions, for thirty years longer.

Fees.—Nearly all the fees payable to the Patent Office must be paid in advance. On filing a caveat, ten dollars; application for patent, fifteen dollars; issuing each original patent, twenty dollars; application for re-issue, thirty dollars; extension, fifty dollars; on depositing a trade-mark, twenty-five dollars.

PATENT-LAWS and PATENT-OFFICE LIBRARY AND MUSEUM. See SUPPLEMENT i Vol. X.

PATERA (Lat.), a round dish, imitations of which were carved by the Romans in the panel

of their ceilings, &c. The name is also applied

Patera.

to the foliated ornaments used in the same position.

PATERCULUS, C. VELLEIUS, a Roman historian, descended from an ancient and wealthy Campanian family, is thought to have been born about 19 B. C. He entered the army at an early age, and from 4 to 12 A. D. served under Tiberius as prefect or legate in Germany, Pannonia, and Dalmatia. He was a great favourite with Tiberius, and when the latter became emperor, 14 A. D., P. was appointed prætor. He was alive in 30 A. D., as his history comes down to that year; but it is conjectured that in the following year he was probably put to death as one of the friends of Sejanus, of whom he speaks highly in his work. P.'s claim to remembrance is his *Historiæ Romanæ*, a compendium of universal, but more particularly of Roman history, in two books. The work, as we have it, is not complete; the beginning, and a portion following the 8th chapter, being wanting. It seems to have commenced with the fall of Troy; and describes only the most prominent historical incidents, but these, fortunately, with considerable fullness of detail. Scholars are satisfied that it is the work of a man who is, on the whole, impartial and discriminating. The style is based on that of Sallust. The *editio princeps* of the *Historiæ Romanæ* appeared at Basel in 1520; the most valuable is Rhunken's, on account of its excellent notes (Lugd. Bat. 1789), reprinted by Frotscher (Leips. 1830—1839); but Orelli's (Leips. 1835) has the least corrupt text.

PATEREROS, were small pieces of ordnance, now obsolete, worked on swivels; most commonly used on board ships, where they were mounted on the gunwale, and discharged showers of old nails, &c., into hostile boats. The French called them Pierriers, from loading them with stones.

PATER-NOSTER (Lat. 'Our Father'), called also THE LORD'S PRAYER, a short form of prayer suggested or prescribed by our Lord to his disciples (Matt. vi. 9—13, Luke xi. 1—4) as the model according to which, in contrast with the prayers of the Pharisees, their petitions ought to be composed. From the earliest times the Pater-Noster has been accepted as, by excellence, the form of Christian prayer. It formed part of all the ancient liturgies. So sacred, indeed, was its use, that, strange as the provision may now appear, it was comprehended among the things which were reserved from pagans and catechumens under the well-known Discipline of the Secret (q. v.). The early fathers—Origen, Tertullian, Cyprian—refer to it in terms which shew that even then it was a recognized form of private prayer. It was solemnly recited at the administration of baptism, and one of the privileges of the baptised was the use of the Pater-Noster. More than one of the fathers, and very many later writers of every form of Christian belief, have devoted special treatises to the exposition of this prayer, which is regarded as embracing in its few but comprehensive clauses all the fitting and legitimate objects of the prayer of a Christian. The Catechism of the Council of Trent contains a

detailed exposition and commentary of it, and in all the services not only of the Roman Missal, Breviary, Ritual, Processional, and Ordinal, but in all the occasional services prescribed from time to time, it is invariably introduced. In the Rosary (q. v.) of the Virgin Mary it is combined with the Hail Mary, the prayer addressed to the Virgin (whence the larger beads of the 'Rosary' are sometimes called *Pater-Nosters*), and perhaps the most usual of all the formal shorter devotions among Roman Catholics is the recitation a stated number of times of the 'Pater,' with one or more 'Ave Marias,' generally concluding with the Doxology. The form of this prayer as commonly used by Protestants concludes with the clause, 'for Thine is the kingdom, and the power, and the glory for ever. Amen.' This clause is not used by Roman Catholics. Of the two gospels—that of Matthew and that of Luke—in which the delivery of the prayer by our Lord is related, that of Luke has not this clause; and even in the Gospel of Matthew it is found only in the later MSS., in which it cannot be doubted that it is a modern interpolation. It was retained, however, in Luther's German translation, and in the Authorised Version, whence its use became common among Protestants.

PATERSON, a city of New Jersey, U.S., at the falls of the Passaic River, on the Morris Canal, and New York and Erie Railway, 17 miles north-west of New York, a well-built city, with upwards of 20 cotton factories, extensive paper-mills, and factories of locomotives, carriages, flax, and hemp, and large silk factories (employing about 8000 hands), &c.—to which the falls of the Passaic furnish water-power. The manufacture of locomotives is conducted on an extensive scale. The city contains county buildings, an academy, several banks, 5 newspapers, and 40 churches. Pop. in 1860, 19,588; 1870, 33,579; 1880, 51,031.

PATERSON, WILLIAM, the most celebrated, after John Law (q. v.), of the commercial schemers of the 17th c., was, like Law, a Scotchman, and is said to have been born in the parish of Tinwald, Dumfriesshire, about 1660. Of his early history nothing is known beyond the fact, established by conclusive evidence, that he possessed himself of an extensive and minute knowledge respecting the institutions and commerce of foreign countries. His first appearance in history is at the time when he laid before the merchants and capitalists of London the complete draught of his scheme of banking. The scheme was favourably, nay even eagerly, adopted by them, and after being modified so as to render it practically serviceable, became the basis of an institution which, in 1690, was incorporated under the name of the 'Bank of England.' P., however, soon became, for reasons now unknown, disconnected with the Bank. His next project was the renowned Darien Scheme (q. v.), which received the royal sanction in 1695, and came to ruin in 1701. Its disastrous failure so affected P. as to produce temporary lunacy, and after his recovery he lived in retirement. Nothing further is known concerning him.

PATHOLOGICAL ANATOMY, or the anatomy of diseased organs, is included in, but must not be confounded with pathology, as until comparatively lately was often the case. It is merely a section—although a most important section—of pathology, contributing (as Professor Vogel has well remarked) 'to practical medicine the solid materials from which to construct a basement, without having the power to erect a perfect edifice.' Pathological anatomy enables the surgeon to decide whether a suspicious tumour is malignant or of a comparatively harmless nature, and

in many other ways is of the greatest importance to surgery; and although at first sight it might appear to be of small importance in relation to Therapeutics, this is not in reality the case. Scientific treatment necessarily demands an accurate knowledge of the material changes which lie at the foundation of the various morbid symptoms. Hence pathological anatomy not only forms a portion of the positive basis of Therapeutics, but it also points out the processes by which the different altered parts may be gradually restored to their normal condition. It not merely indicates what requires healing, but in many cases also the course that must be adopted in order to aid the curative tendency of nature. It likewise serves as a check on therapeutics, exposing, in a most conclusive manner, the absurdity of many pretended methods of cure. It points out, for example, that in a certain stage of inflammation of the lungs (Pneumonia) a fibrinous fluid separates from the blood, and by its coagulation renders a portion of the tissue of the lung impermeable to air; and further that it requires several days for this coagulated matter to resume the fluid condition and to be removed. If any one should assert—and such assertions have often been made—that in this stage of the disease he could apply a remedy which would cure the patient in a few hours, a very slight knowledge of pathological anatomy would shew the folly of such an assertion. The best English works on this subject are Vogel's *Pathological Anatomy of the Human Body*, and Jones and Sieveking's *Manual of Pathological Anatomy*.

PATHOLOGY (from the Gr. *pathos*, disease, and *logos*, a discourse) is that department of medicine which treats of the doctrine of morbid actions or diseases. In this country the term is so far restricted as not to include the causes, treatment, &c., of diseases, but the most eminent French and German writers regard it as equivalent to 'the Theory and Practice of Medicine,' and consider it as treating not only of the classification, causes, symptoms, and physical signs of diseases, but as also including their seat, the phenomena which precede and follow them, their progress, their duration, their modes of termination, the different forms in which they occur, their complications, the changes to which they give rise in the solids and fluids of the body, and their treatment.

PATMOS, a bare and rocky island in the Ægean Sea, about 45 miles in circumference. It belongs to the group called the Sporades, lies to the south of Samos, and is now called Patino, but in the middle ages *Palmosa*, although there is now only one palm-tree in the whole island. It is celebrated as the place to which the apostle John was exiled, and where he saw the visions recorded in the Book of Revelation. On the top of a mountain stands the famous monastery of 'John the Divine,' half way up to which a cave is pointed out to the traveller in which, according to tradition, the apostle received his revelations. See Ross's *Reisen auf den Griechischen Inseln des Agäischen Meeres*, and Guérin's *Description de l'Île de Patmos*, &c. (Paris, 1856).

PATNA, or more correctly, PATTANA (i. e., the town), an important trading town of Hindustan, chief town of a British district and division of the same name in Bahar, Presidency of Bengal, stands on the right bank of the Ganges, and 397 miles by land north-west of Calcutta. The city proper, forming a quadrangle, extends a mile and a half along the river-side, and is half that extent in breadth. P. is generally supposed, however, to include the suburbs which stretch on each side of it on the south bank of the

Ganges. The European quarter is on the west of the town proper. Here are a church, chapel, Roman Catholic cathedral; government offices; school; the Nabob's palace; the great tank, and several noteworthy mosques and tombs. The streets of P. are covered with mud and slime in winter, and the air is thickly impregnated with choking dust in summer. Pop. (1881) 170,654.

P., under the former name of *Padmavati*, is supposed to have been the capital of Bahar, 419 years B. C. Here, at an early period, the English established factories and traded in opium, rice, &c. In 1763, disputes about transit-duties arose between the Company's servants and the native government. A war ensued, resulting in the British taking possession of the district. P. was the head-quarters of the Wahabi or Mussulman conspiracy in 1864. Chief seat of the opium trade; trade also in table linen, wax candles, toys, bird-cages, and talc pictures. The division of P. has an area of 23,732 sq. m., and a pop. of 13,122,743: the district, an area of 2101 sq. m., and a pop. of 1,559,638.

PATOIS (of uncertain derivation), the French term applied to corrupt dialects of a language spoken by the uneducated. See DIALECT.

PATON, SIR JOSEPH NOEL, one of the most distinguished living Scottish artists, was born in Dunfermline in 1823. It is understood that in early life he employed himself in making designs for the damask manufacturers of his native place, and for the muslin and lace embroiderers of Paisley. He, however, soon turned his attention to the work of art proper, and his cartoon sketch, 'The Spirit of Religion,' gained one of the three premiums at the Westminster Hall competition in 1845. Two years thereafter, his oil-picture of 'Christ bearing the Cross,' and his 'Reconciliation of Oberon and Titania,' jointly gained the prize of £300. He subsequently executed a companion-picture to the 'Reconciliation,' entitled the 'Quarrel of Oberon and Titania,' and both now adorn the Royal Scottish Academy's galleries in Edinburgh. These pictures made the artist's reputation. Although somewhat hard and dry in colour, and without any retiring and shadowy depth, they are full of brilliant fancy; and the multitudes of figures, and the variety of fairy incident, affect the spectator much in the way that the constant sparkle of Congreve or Sheridan affects the reader. He has since painted much more simply and powerfully. 'Dante Meditating the Episode of Francesca,' was exhibited in Edinburgh in 1852; and the 'Dead Lady,' a work of great and solemn pathos, in 1854. In 1855, his great picture, 'The Pursuit of Pleasure,' was exhibited and much admired, and sold for two thousand guineas. He has since painted 'Home from the Crimea,' a replica of which is in the possession of Her Majesty; and 'In Memoriam,' a scene from the Indian mutinies; and for the Association for the Promotion of the Fine Arts in Scotland, a series of picture-illustrations of the 'Dowie Dens o' Yarrow.' The three works referred to have been engraved, and are deservedly popular. His last picture of importance, 'Luther at Erfurt,' was exhibited in London in 1862, and subsequently in Edinburgh. He has not confined himself to painting alone. In conjunction with his brother, he illustrated Professor Aytoun's *Lays of the Scottish Cavaliers*, published Christmas, 1863; and for the London Art Union, 1864, he executed twenty illustrations of the *Ancient Mariner*.

P. has worked with the pen as well as with the brush and pencil. In 1861 appeared his volume of poetry, entitled *Poems by a Painter*, full of grace, melody, and eloquence. He was knighted in 1867.

PATONCE, Cross, in Heraldry (*Lat. patena* expanding), a cross with its terminations expanding like early vegetation or an opening blossom.

PATOS, LAGOADES. See SUL, RIO GRANDE DO.

PATRAS (ancient *Patra*, Turk. *Bahabadra*), a fortified seaport, and the most important trading town in the west of Greece, in the government of Achaia and Elis, stands on the eastern shore of the gulf of the same name, 12 miles south-south-west of Lepanto. It is overlooked by the strong citadel—on the site of the ancient Acropolis—crowning a ridge, on the southern slopes of which the ancient city, as well as the modern one before the revolution, was built. The P. of to-day stands on a level space close to the sea. The plain of P. is exceedingly valuable for the currants grown, and which are the most important export of the town. Its harbour, though protected by a mole, is unsafe, and exposed to heavy seas. Earthquakes frequently occur, and most of the houses are on that account only of one story. Capotes, made of mixed wool and goat's hair, are manufactured and besides currants, silk, cotton, wool, and hides are exported. P. is a thriving town, and has almost entirely recovered from the injury it sustained during the Greek revolution. Pop. about 20,000.

Patra is the only one of the 'twelve cities' of Achaia which still exists as a town; but most of its relics have been swept away by earthquake and revolution.

PATRIA POTESTAS is the term used to express the power which the civil law gave to the Roman father over his children, and which has been the foundation of the greatly modified paternal authority recognised in modern systems of jurisprudence. The right of a parent to control his child not come to years of discretion is a part of natural law, but the more extensive *patria potestas* of the Romans was probably a relic of those early times in which families, or tribes considered as families, led a wandering pastoral life in dread of each other, under the guidance of a chief, whom it was necessary to invest with an almost unlimited authority.

By the Roman law, the *patria potestas* was acquired naturally, by the birth of a child in wedlock, or civilly, by legitimation or adoption. An unemancipated son or daughter, a grandchild by a son, or any other descendant by males, was viewed as a part of the parent's property. In early times a father had the power of life and death over his children: by the Laws of the Twelve Tables he could sell them as slaves, or could transfer them to another family by adoption. Under the republic, the despotic authority exercised by fathers over their offspring was practically limited to a considerable extent by the censors, and several emperors issued constitutions to restrain the cruelties often perpetrated by fathers towards their children. First the right of sale, and then that of life and death was taken away. Alexander Severus restricted the right of the father to moderate chastisement, and Constantine declared that the father who should kill his son was to be held guilty of murder. By the early Roman law, the son, being in his father's power, could not acquire property for himself; his acquisitions all belonged to his father; hence he was incapable of making a testament. There were, however, particularly in later times, modes by which he could acquire *peculium*, or property which should be independent of his father. A father might give

Patonce.

his son property to trade on, which would be his own; and latterly a son acquired for himself whatever he gained in military service, or by the discharge of certain civil functions. In all matters belonging to the *res publicum* a son was independent of his father; he could vote at the elections, hold the most important offices of state, or command the army. He could also be a tutor, tutory being considered a *munus publicum*. In later times, a son promoted to the consular dignity ceased to be under the restraints of paternal control, but, unlike an emancipated son, he retained his rights of succession. Lawful children were entitled to aliment from their parents; an obligation attached in the first instance to the father and mother, and, failing them, to the grandfather. Until the time of Justinian, illegitimate children had only a claim for support against their mother; that emperor gave them a right to demand aliment from their father.

In no modern system has the paternal power been carried so far as under the Roman law. According to the French 'Code Civile,' a child is under the authority of his parents till majority or emancipation; up to that time he cannot quit the paternal residence without leave of his father, except for enrolment in the army at 18 years of age. Majority is attained at the age of 21, but a minor is emancipated by marriage. At 15, a minor may be emancipated by his father, or, if his father be dead, by his mother, by a simple declaration before a magistrate. The father possesses somewhat extensive powers of chastisement. He may obtain a warrant to arrest his child under 16, and detain him in prison for a month; and an order may be obtained for the incarceration for six months of a child above 16, on cause shewn to the satisfaction of the magistrate. Parents are entitled to the usufruct of their children's property till the age of 18 or emancipation, subject to the burdens of maintenance and education; but this right does not extend to property acquired by the industry of the children, or bequeathed by a stranger under the condition of an exclusion of parental interference.

By the law of England, a father is guardian to his lawful children in minority, though this right ceases to some extent at 14. He has the power of moderate chastisement. As guardian, he receives the rents of any real estate which the child may possess, which he must account for when majority is attained. The paternal power never extends beyond majority, and, to some effect, marriage acts as an emancipation. A father may by deed appoint a guardian to such of his children as are unmarried at his death till they attain majority.

In Scotland a father has a general control over the persons of his children during pupilarity; that is, till the age of 14 in the case of sons, and 12 in the case of daughters. He may fix their place of residence, direct their education, and inflict reasonable chastisement. The limits of the *patria potestas* as regards children who have attained puberty, but are under 21 years of age, are not very exactly defined; but it seems to be understood that in ordinary circumstances minors are not entitled to choose their own place of residence in defiance of paternal authority. The father is administrator-in-law, and tutor and curator of his children, unless in the case of an estate left by a stranger and placed under separate management. This guardianship ceases on majority, or on the marriage of a daughter.

PATRIARCH (Gr. *patriarches*, the head of a tribe) is the name given to the heads of the families in the antediluvian period of Scripture history, and is still more familiar as the designation in Jewish history of the three progenitors of the Jewish people, Abraham, Isaac, and Jacob. In the

later history of the Jews, too, after the destruction of Jerusalem, the name was used to designate the heads of the Sanhedrim, one of whom, the patriarch of the west, resided at Tiberias, in Galilee, and the other, the patriarch of the Eastern Jews, at Babylon. The most familiar use of the word, however, is in the history of the Christian church. It is the name given to the bishops of certain great Metropolitan (q. v.) Sees, who not only held rank beyond other metropolitans, but also enjoyed a jurisdiction almost identical with that of the metropolitan in his own province over all the metropolitans themselves (with their provinces) included in their district, which was called a **PATRIARCHATE**. The name patriarch originally seems to have been given commonly to bishops, or at least was certainly given in a less special sense than what it eventually assumed; nor can the date at which the title first assumed its now received use be exactly determined. It is certain, however, that the name and the office were both recognised before the Council of Nice, at which time, as we learn from the sixth canon, the patriarchal sees, acknowledged by 'ancient custom,' were three in number, Rome, Antioch, and Alexandria. After the translation of the seat of empire to Byzantium, thenceforward called Constantinople, that see, originally subject to the metropolitan of Heraclea, obtained, first metropolitan, and afterwards patriarchal rank; and eventually established a precedence over the patriarchs of Antioch and Alexandria, being second only to Rome. The contests between the patriarchs of Rome and Constantinople were among the chief causes of the **GREEK SCHISM** (q. v.). To these four patriarchates was added a fifth, in the year 451, that of Jerusalem, which was formed out of the ancient patriarchate of Antioch. The limits of these five patriarchates can only be loosely assigned. The authority of a patriarch was, in the main, that of a metropolitan, but extended over the metropolitans themselves. He had a right to consecrate the metropolitans, and to preside over the councils of his patriarchate. After the Greek Schism, and particularly after the establishment of the Latin Kingdom of Jerusalem, Latin prelates were appointed with the title and rank of patriarch in the four great Eastern sees. It was hoped that the union of the churches, effected at the Council of Florence, would have put an end to the contest thus created; but that union proved transitory, and the double series of patriarchs has been continued to the present day. The Nestorian and Eutychian sections of the Eastern Churches, too, have each their own patriarch, and the head of that portion of the former, which in the 16th c. was reconciled with the Roman see, although known by the title of *Catholicos*, has the rank and authority of patriarch. After the separation of the Russian Church from that of Constantinople, the name and authority of the metropolitan in the end was transformed into that of patriarch. But the office was suppressed by Peter the Great.

Besides these, which are called the **Greater Patriarchates**, there have been others in the Western Church known by the name of **Minor Patriarchates**. Of these the most ancient were those of Aquileia and Grado. The latter was transferred to Venice in 1451; the former was suppressed by Benedict XIV. France also had a patriarch of Bourges; Spain, for her colonial missions, a patriarch of the Indies; and Portugal a patriarch of Lisbon. These titles, however, are little more than honorary.

In the non-united Greek Church, the ancient system of the three patriarchates of Constantinople, Antioch, and Jerusalem is nominally maintained, and the authority of the patriarchs is recognised by their own communion. But the jurisdiction-limits

of the patriarch of Constantinople, who is acknowledged as the head, have been much modified. The Russo-Greek Church withdrew from him partially in the 17th, and finally in the 18th century. That of Greece proper has been practically separated since the independence of the kingdom of Greece; and some years since it formally declared its independence. The patriarchs of Jerusalem and Antioch have few followers of their own rite.

PATRIARCHAL CROSS, a cross which, like the patriarchal crossier, has its upright part crossed by two horizontal bars, the upper shorter than the lower. A cross patriarchal fimbriated or was a badge of the Knights Templars.

Patriarchal Cross.

PATRICIAN (Lat. *patricius*, from *pater*, father), a name given to the members of Roman *gentes*, of whom the *populus Romanus* consisted, and to their

descendants by blood and adoption. *Patres* and *patricii* were in the early days of Rome synonymous, they were so named from the *patrocinium* which they exercised over the whole state, and all classes of whom it was composed. Niebuhr's researches have established that, until the *plebs* became a distinct order, the patricians were the entire citizens or *populus* of Rome; a select number of them were senators; and the original inhabitants, reduced to a condition of servitude, were known by the name of *clientes* or *plebs*. The amalgamation of the three tribes of Ramnes, Tities, and Luceres, gave rise to a distinction between *patres majorum gentium* and *patres minorum gentium*—the latter term being applied to families recently elevated to an equality with the old patrician class. On the establishment of the plebeians as a distinct order, sharing certain rights with the patricians, the patriciate became an aristocracy of birth, in the exclusive possession of a number of important privileges. A long struggle between the two orders ended in the attainment by the plebeians of a political equality, and the establishment of a new aristocracy of *nobiles* based on wealth and office. Under Constantine, the dignity of *patricius* became a personal title; not hereditary, but conferring very high honour and certain privileges. It was created at Constantinople, and not confined to Romans or subjects of the empire, but sometimes bestowed on foreign princes. These patricians, unlike the old Roman order, were distinguished in dress and equipage from the ordinary citizens. The popes in after times conferred the same title on eminent persons and princes, including many of the German emperors. In several of the Germanic kingdoms the title of patrician was bestowed on distinguished subjects; and in some parts of Italy the hereditary nobility are still styled patricians.

PATRICK, St, a distinguished missionary of the 5th c., commonly known as the Apostle of Ireland. There is some uncertainty as to the date and place of his birth. The year of his birth is variously assigned to the years 377 and 387, of which the latter, if not even a later date is more probable. Of the place, it is only known for certain, from his own confession, that his father had a small farm near Bonavem Taberniae; and in one of the ancient lives he is said to have been born at Nemthur. Arguing on these data, connected with other collateral indications, some writers assign his birthplace to the present Boulogne-sur-Mer; others to a place in the estuary of the Clyde (called from him Kilpatrick) at or near the modern Dumbarton. His father, he himself tells, was a deacon named Calurnius; his mother, according to the ancient biographers, was named Conches or Conchessa,

according to some of these authorities, a sister of St Martin of Tours. P.'s original name is said to have been Succath, *Patricius* being the Roman appellation by which he was known. In his 16th year he was seized, while at his father's farm of Bonavem Taberniae, by a band of pirates, and with a number of others was carried to Ireland, and sold to a petty chief, in whose service he remained for six years; after which he succeeded in effecting his escape, and, probably after a second captivity, went to France, where he became a monk, first at Tours, and afterwards in the celebrated monastery of Lerins. In the year 431 he went to Rome, whence he was sent by the pope of the day, Celestine, to preach in Ireland; Palladius, who had been sent as missionary to that country a short time before, having died. Such is the received account of his mission; but Dr Todd, his latest biographer, regards this statement as erroneous, and fixes the date of his coming to Ireland eight years later. He was ordained in France, and arrived in Ireland in 432. His mission was eminently successful. He adopted the expedient of addressing himself first to the chiefs, and of improving, as far as possible, the spirit of clanship, and other existing usages of the Irish for the furtherance of his preaching; nor can it be doubted that he had much success in Christianising the ancient Irish system of belief and of practice. By degrees he visited a large portion of the kingdom, and baptised great numbers as well of the chieftains as of the people. According to the accounts of his Irish biographers, he founded 365 churches, and baptised with his own hand 12,000 persons. He is said also to have ordained a vast number of priests, and to have blessed very many monks and nuns. After he had been about 20 years engaged in his missionary enterprise, he is said to have fixed his see at Armagh about the year 454; and having procured two of his disciples to be ordained bishops, he held probably more than one synod, the decrees of which have been a subject of much controversy. He died at a place called Saul, near Downpatrick; and his relics were preserved at Downpatrick down to the period of the Reformation. The place is still venerated by the people. The date of his death is much disputed; the Bollandists placing it in 460, while Ussher holds it to have been 493. Dr Todd inclines strongly to the latter opinion, in which case P.'s age would have been 126, or at least 116. The only certainly authentic literary remains of St P. are his 'Confession' and a letter, both of very rude Latinity, but of much historical interest. The letter is addressed to Coroticus, who is supposed to have been a Welsh chieftain named Caradoc (from whom Cardigan is named), who had made a descent on the Irish coast, and slain or carried off, with circumstances of great cruelty, a number of the Irish, many of whom were neophytes. These, with some other remains ascribed to him, as also decrees of synods, were published in Wilkins' *Concilia*, and separately by Ware, *Opuscula S. Patriaci Adscripta* (1656), and by Villanueva (Dublin, 1835). The latest biography of St P. is that of the Rev. J. H. Todd, 1 vol. 8vo. (Dublin, 1863).

PATRICK, ST, ORDER OF, a national order of knighthood for Ireland, established by George III. on the 5th of February, 1783, and enlarged in 1833. As originally constituted, it consisted of the Sovereign, the Grand-master (who was always the lord-lieutenant of Ireland for the time being), and 15 Knights. By the statutes of 1833 the number of knights was increased to 22.

The *Collar* of the order (of gold) is composed of roses alternatino with harps, tied together with a

knot of gold, the roses being enamelled alternately white within red, and red within white, and in the centre is an imperial crown surmounting a harp of gold, from which the badge is suspended. The *Badge* or *Jewel* is of gold, and oval; surrounding it is a wreath of shamrock proper on a gold field; within this is a band of sky-blue enamel charged with the motto of the order, *QUIS SEPARABIT MDCCCLXXXIII* in gold letters; and within this band a saltire gules (the cross of St Patrick), surmounted by a shamrock or trefoil slipped vert, having on each of its leaves an imperial crown or. The field of the cross is either argent, or pierced and left open.

Order of St Patrick.

A sky-blue *Ribbon*, worn over the right shoulder, sustains the badge when the collar is not worn. The *STAR*, worn on the left side, differs from the badge only in being circular in place of oval, and in substituting for the exterior wreath of shamrocks eight rays of silver, four of which are larger than the other four. The *MANTLE* is of rich sky-blue tabinet, lined with white silk, and fastened by a cordon of blue silk and gold with tassels. On the right shoulder is the *HOOD*, of the same materials as the mantle.

The order is indicated by the initials *K. P.*

PATRIPASSIANS (Lat. *pater*, father, and *passus*, suffered), the name of one of the earliest classes of anti-Trinitarian sectaries, who, in maintaining the oneness of the Godhead, held that all that is ascribed in the Scriptures, according to the Trinitarian exposition, to any of the Three Persons, is in reality true of the one Principle, whom alone these sectaries admitted, being in consequence called 'Monarchians' (Gr. *monos*, one, and *archē*, principle). The leader of this sect was Praxeas, a native of Phrygia, who lived in the end of the 2d century. The name *P.*, for which the Greek equivalent was *Patropaschite*, was in some sense a sobriquet, being founded on what their antagonists regarded as the absurd consequence derivable from their doctrine—viz., that as it was true to say that Jesus, in whom dwelt the Logos, or the Son, suffered, therefore it

would be true on their principles to say that the Father suffered. The sect in this particular form was chiefly known in Rome; but their principles are in the main the same with those of the Sabellians. In Rome, Praxeas was succeeded by Noetus, but the party does not appear to have been numerous or influential.

PATROCLUS. See *ACHILLES*.

PATROL is a detachment of five or six soldiers, fully armed, sent out, under a sergeant, from the main guard or picket to traverse the streets of a garrison town, &c., and arrest disorderly persons or soldiers out of barrack without proper passes. Prisoners are taken to the guard-house, and brought before the town-major. In a besieged fortress, *patrols* are strong bodies of men employed to promenade the lines of defence, and watch against any assaults on the part of the enemy.

PATRON (Lat. *patronus*, from *pater*, father), among the Romans originally signified a citizen who had dependents, who were called *clients*, attached to him. Before the time of the Laws of the Twelve Tables, the most frequent use of the term *patronus* was in opposition to *libertus*, these two words being used to signify persons who stood to one another in the relation of master and manumitted slave. The Roman was not denuded of all right in his slave when he freed him; a tie remained somewhat like that of parent and child, and the law recognised important obligations on the part of the *libertus* towards his patron, the neglect of which involved severe punishment. In some cases the patron could claim a right to the whole or part of the property of his freed man. The original idea of a patron apart from the manumitter of slaves continued to exist. A Roman citizen, desirous of a protector, might attach himself to a patron, whose client he thenceforward became; and distinguished Romans were sometimes patrons of dependent states or cities, particularly where they had been the means of bringing them into subjection. Thus the Marcelli were patrons of the Sicilians, because Claudius Marcellus had conquered Syracuse and Sicily. The patron was the guardian of his client's interest, public and private; as his legal adviser, he vindicated his rights before the courts of law. The client was bound, on various occasions, to assist the patron with money, as by paying the costs of his suits, contributing to the marriage portions of his daughters, and defraying in part the expenses incurred in the discharge of public functions. Patron and client were under an obligation never to accuse one another; to violate this law amounted to the crime of treason, and any one was at liberty to slay the offender with impunity. One obvious effect of the institution of *clientela* was the introduction of an element of union between classes of citizens who were otherwise continually brought into opposition to each other. As the patron was in the habit of appearing in support of his clients in courts of justice, the word *patronus* acquired, in course of time, the signification of advocate or legal adviser and defender, the client being the party defended; hence the modern relation between counsel and client.—*Patron*, in after times, became a common designation of every protector or powerful promoter of the interests of another; and the saints, who were believed to watch over the interests of particular persons, places, trades, &c., acquired in the middle ages the designation of their patron saints. The saint in whose name a church is founded is considered its patron saint.

The term Patron has also been applied to those who endowed or supported churches and convents. See **PATRONAGE**, **ECCLESIASTICAL**.

PATRONAGE, ECCLESIASTICAL, the right of presenting a fit person to a vacant ecclesiastical benefice. The patron, in the original and more strict sense, was the person who founded or endowed the church. In the early ages of Christianity, the countries where the new religion had been adopted were parcelled out into large districts or dioceses, under the superintendence of a bishop, who usually resided in the neighbourhood of one of the religious houses. Within such district the bishop had the nomination of the priests, who supplied religious instruction to the people. The priests were paid out of the episcopal treasury, and travelled about in the exercise of their duties, having their residence with the bishop, and forming that *episcopi clerus* which constituted the notion of cathedral churches and monasteries in their simplest form. Occasionally a bishop endowed a church in his diocese, and attached a priest permanently to it; and in Gaul, in the 5th c., a bishop who founded a church in a neighbouring diocese was allowed to appoint an incumbent of his choice. As Christianity became more universal, and the population increased, the means of worship supplied by the bishoprics, the monasteries, and occasional episcopally endowed churches, became inadequate for the demands of the people, and the proprietors of lands began to build and endow churches in their own possessions. In such cases the chaplain or priest was not paid by the bishop, but allowed to receive for his maintenance, and for the use of his church, the whole or a part of the profits of the lands with which the founder had endowed it, and the offerings of those who frequented the church for worship. A district was defined by the founder, within which the functions of the officiating priest were to be exercised; and both the burden and the advantages of his ministry were limited to the inhabitants of that district. As these pious foundations tended both to the advancement of religion and to the relief of the episcopal treasury, they were encouraged by the bishops, who readily consecrated the churches thus established, and consented that the incumbent should be resident at the church, and receive the tithes and offerings of the inhabitants and what endowment the founder had annexed to the church. Eventually, it came also to be stipulated with the bishop that the founder and his heirs should have a share in the administration of the property, and have the right to nominate a person in holy orders to be the officiating minister whenever a vacancy occurred. It also became a not unusual arrangement that when owners of estates rebuilt such churches as were dependent on the cathedral, or undertook to pay the incumbent, to the relief of the cathedral, the right of presentation was transferred from the bishop to these persons, who thenceforward stood in the same relation to these churches as if they had been the original founders. Out of these private endowments arose the parochial divisions of a later time, which thus owe their origin rather to accidental and private donation than to any legislative scheme for the ecclesiastical subdivision of the country. The bounds of a parish were at first generally commensurate with those of a manor, and the lord of the manor was the hereditary patron. The person enjoying the privileges of a founder was called *patronus* and *advocatus*. He had a pre-eminent seat and a burial-place in the church; he enjoyed a precedence among the clergy in processions; his name and arms were engraved on the church and on the church-bells, and he was specially named in the public prayers. He had the right to a certain portion of the church funds, called *patronagium*, and enjoyed the fruits of the benefice during a vacancy. In the course of time it sometimes happened that,

with the concurrence of all parties interested, the patronage, and the church with its revenues and appurtenances, were made over to a religious house, which thus became both patron and perpetual incumbent of the parish, while the immediate duties of the cure were devolved on a vicar or stipendiary curate. In France, the right of patronage was often extended to churches not originally private foundations by the necessities of the sovereigns, which led them to take possession of church property, and bestow it in fee on laymen, who appropriated the greater part of the revenues, and took the appointment of the clergy into their own hands. For a length of time, not merely the nomination but the investiture of the clergy came to be exercised by lay patrons, a state of matters which roused the indignation of successive popes and councils: until it was at last ruled by the third and fourth Lateran Councils (1179 and 1215 A.D.) that the presentation of the patron should not of itself suffice to confer any ecclesiastical benefice, even when qualified by the discretionary power of rejection given to the bishop, when the presentee was a layman. It was declared necessary that the presentee should not merely have the temporalities of the benefice conferred on him by induction, but also be invested with the spiritualities by institution. When the bishop was patron of the benefice, the ceremonies of induction and institution were united in that of collation. With the growth of the papal power, however, a practice arose by which the right of presentation or induction, which had nominally been left to the patrons, became in some degree nugatory. Towards the close of the 12th c., letters of request, called mandates or expectatives, began to be issued by the popes to patrons, praying that benefices should be bestowed on particular persons. What had at first been requested as a favour was soon demanded as a right, and a code of rules was laid down with regard to grants and revocations of expectatives. In the 13th c. the patronage of all livings whose incumbents had died at the court of Rome (*vacantia in curia*) was claimed by the pope; and as ecclesiastics of all ranks from every part of Europe frequently visited Rome, the number of benefices *vacantia in curia* was always very great. Clement V. went so far as broadly to declare that the pope possessed the full and free disposal of all ecclesiastical benefices. The practice next arose of the pope making reversionary grants, called provisions of benefices, during the lifetime of the incumbent, and reserving what benefices he thought fit for his private patronage. By means of permissions to hold benefices *in commendam*, and dispensations for non-residence and holding of pluralities, upwards of fifty benefices were often held by one person; and throughout all Europe the principal benefices were filled by Italian priests, nominees of the popes, who were often ignorant of the very language of the people among whom they ministered. In the 14th c. these claims encountered much opposition. England took the lead in an organised resistance, which was in the end successful. A series of English statutes was passed, beginning with the Statute of Provisors, 25 Edw. III. c. 6, solemnly vindicating the rights of ecclesiastical patronage, and subjecting to severe penalties (see *PRÆMUNIRE*) all persons who should attempt to enforce the authority of papal provisions in England. The principles adopted by the third and fourth Lateran Councils have since been substantially the law of patronage in Roman Catholic countries. A lay patron is, by the canon law, bound to exercise his right of presentation within four, and an ecclesiastical patron within six months, failing which the right to present accrues *cure devoluta* to the

bishop of the diocese. Patronage has always been more or less subject to alienation, transmission, and the changes incident to other kinds of property. The modern practice of patronage in the Roman Catholic church is detailed under the head PROVISION (q. v.).

In England, where the modified canon law, which was in use before the Reformation, is still in force, the rights of patrons do not materially differ from those which they possess in Roman Catholic countries. For some details regarding the right of presentation in England, see ADVOWSON.

In Scotland, at the Reformation, the rights of patrons were reserved, and presbyteries were bound by several statutes to admit any qualified person presented by the patron. The principle of these statutes was retained in the enactments introducing Episcopacy. On the establishment of Presbytery under favour of the civil war, patronage was abolished by act 1649, c. 23, and the election of the clergy was committed to the kirk-session. At the Restoration, this statute fell under the act rescissory, and patronage was replaced on its former footing. On the reintroduction of Presbytery at the Revolution, patronage was again cancelled, and the right to present conferred on the Protestant heritors and the elders of the parish, subject to the approval or rejection of the whole congregation. In consideration of being deprived of the right of presentation, patrons were to receive from the parish a compensation of 600 merks (£33, 6s. sterling), on payment of which they were to execute a formal renunciation of their rights. Only three parishes effected this arrangement with the patron, and patronage was permanently restored in all the parishes where no renunciation had been granted by 10 Anne, c. 12. This act, with modifications introduced by 6 and 7 Vict. c. 61, is now law. Should a patron fail to present for six months after the occurrence of a vacancy, the right to present falls to the presbytery *jure devoluto*. The presentee, before he acquires a right to the emoluments of the benefice, must be admitted to it by the presbytery of the bounds. He is first appointed to preach certain trial sermons, after which a day is fixed within six weeks for moderating in his call. On that day the people are invited to sign a written call to the presentee to be their minister, and however few the signatures to the call may be, the presbytery are in use to pronounce a formal judgment sustaining it. They then proceed to examine into the qualifications of the presentee, and provided the result be satisfactory, the ordination follows (if he have not been previously ordained), and he is formally admitted minister of the parish by the presiding minister. Soon after the above-mentioned act of Queen Anne, a feeling which had sprung up in favour of popular election, in opposition to patronage, led to various acts of resistance to the settlement of presentees, and brought about two considerable secessions from the Church of Scotland. It continued for a length of time to be a subject of dispute how far the right of the church to judge of the fitness of presentees could entitle her to make rules tending to disqualify them, and in particular whether she could legally make the dissatisfaction of the congregation a disqualification. For a long time prior to 1834, there had been no attempt to give effect to any dissent on the part of the congregation. In that year the law of patronage again became a ground of contention, when a majority of the General Assembly embodied their views on the subject in the so-called Veto Act, which declared that no minister was to be imposed on a congregation when a majority of heads of families and communicants should dissent from

his admission. The decision of the Court of Session, confirmed by the House of Lords, finding this act to be *ultra vires* of the General Assembly, led to the secession of 1843 and formation of the *Free Church* (q. v.). After that event, an act, 6 and 7 Vict. c. 71, commonly called Lord Aberdeen's Act, was passed to fix by a legislative provision the effect which the church courts were in future to be entitled to give to the dissent of the congregation in the collation of ministers. It is there enacted, that after the trial sermons, the presbytery shall give to the parishioners, being members of the congregation, an opportunity to state objections which do not infer matter of charge to be proceeded against according to the discipline of the church. The presbytery are either to dispose of the objections, or to refer them to the superior church judicatory; and if the objections be considered well founded, the presbytery may reject the presentee. No power is, however, given to reject him on the ground of mere dislike as such on the part of any portion of the congregation. In Scotland, patronage is in all cases a heritable right; it is transferable by disposition without infetment, but capable of being feudalised, after which it can be completely conveyed only by infetment.

In the Protestant churches of Germany, Sweden, and Denmark, patronage exists to some extent, subject to restrictions, which differ much in different localities. The right to present is sometimes divided between the patron and the consistory. The parishioners have in many instances a voice: the appointment may be entirely in their hands, or they may have merely a right to reject the presentee after he has been subjected to the ordeal of a trial sermon; and in either case this right may be exercised, according to local usage, either by the parishioners at large, by a committee of their number, or by the *bürgermeister*. When there is no patron, the choice generally rests with the consistory in East, and with the parishioners in West Germany. Induction by the superintendent completes the right of the presentee.

In the Greek Church the right to present is generally in the hands of the bishops, excepting in Russia, where lay patronage exists to a limited extent.

PATRONYMIC (Gr. *pater*, father, and *onoma*, name), properly a name taken from one's father, but generally applied to such names as express descent from a parent or ancestor. In Sanskrit, Greek, and Latin, patronymics are very numerous. They may be derived from the name of a father, mother, grandfather, or remoter ancestor, as Atrides, i.e., (Agamemnon), son of Atreus; Philyrides, i.e., (Chiron), son of Philyra; Æacides, i.e., (Achilles), grandson of Æacus. The names of the founders of nations have also been used to form a sort of patronymic, as when the Romans are called Romulidæ. In Greek and Latin the commonest terminations of patronymics are *ides* and *is*. Patronymics have no fewer than thirteen recognised terminations in Sanskrit. A number of the surnames in use in modern times are patronymics, as Johnson, the son of John; Thomson, the son of Thomas. Originally these names fluctuated from generation to generation, as still is, or very recently was, the case in Shetland, where Magnus Johnson's son calls himself John Magnusson or Manson. In the course of time, it was generally found more convenient to take a surname from one well-known ancestor, which should descend unchanged to the children of the bearer of it. The termination *s* is sometimes used as equivalent to son, as in Jones, Rodgers. To patronymics belong Norman, Highland, Irish, and Welsh surnames with the prefixes *Fitz*, *Mac*, *O*, and *Ap*, respectively. In many cases the *Mac* of

the Highlands of Scotland ceased to have a fluctuating character only a few generations ago. In 1465, an act of the parliament of Ireland was directed against the use of patronymics. Every Irishman 'dwelling betwixt or among Englishmen in the counties of Dublin, Myeth, Uriel, or Kildare,' was ordered 'to take to him an English surname of a town, as Sutton, Chester, Trym, Skryne, Corke, Kinsale; or colour, as White, Blacke; or arte or science, as Smith or Carpenter; or office, as Cooke or Butler; and that he and his issue should use the same.' In Wales it was long the practice to use a string of ancestral names, each with the syllable *Ap* prefixed to it. Camden relates that 'in the time of King Henry VIII. an ancient worshipping gentleman of Wales being called at the pannell of a jury by the name of Thomas Ap William &c. Thomas Ap Richard Ap Hoel Ap Evan Vaghan, &c., was advised by the judge to leave that old manner; whereupon he afterwards called himself Moston, according to the name of his principal house, and left that surname to his posterity.' See NAME.

PATTEE, Cross, in Heraldry (Lat. *patulus*, spreading), also called Cross Formée, a cross with its arms expanding towards the ends, and flat at their outer edges.

PATUXENT, a river of Maryland, U.S., rises 20 miles east of Frederick City, and after a south-easterly course of 90 miles, empties by a broad estuary into Chesapeake Bay.

Pattée.

PATTI, **ADELINA** and **CARLOTTA**. See SUPP.

PAU, a flourishing town of France, capital of the department of Basses-Pyrénées, on the right bank of the Gave-de-Pau, 105 miles south-south-east of Bordeaux. It occupies a rocky height, cloven into two portions by a ravine through which a streamlet flows into the Gave-de-Pau, and united by a high bridge. Toward the south it commands most magnificent views of the Western Pyrenees; indeed, for mountain views its situation is hardly surpassed by that of any town in France. As seen from this town, the distant Pyrenees rise in peaks, cones, and serrated ridges, and present an outline as varied as it is strikingly beautiful. The town contains a palace of justice, a promenade, Royal Square, with a bronze statue of Henri IV., beautiful theatre, university-academy, museum, and library of 25,000 vols. Linen and cloth manufactures are the chief branches of industry; in the vicinity, Jurançon wine (good but strong) is grown. Many swine are fed in the vicinity, and from the pork the famous *Jambons de Bayonne* are made. Pau is a favourite resort of the English, especially during winter, and is a general rendezvous for those who wish to explore the Pyrenees. Pop. (1872) 23,407.

The principal building, however, of Pau, and that to which it owes its existence, is the old castle which stands on the ridge overlooking the river, and forms both the most conspicuous and most interesting feature of the town. It has five towers, united by an outer wall, and is supposed to have been founded by Gaston de Foix about the year 1363. Pau was the capital of the kingdom of Bearn, and its castle was the birthplace of Henri IV.

PAUCHONTI TREE. See SUPP. in Vol. X.

PAUL, the great apostle of the Gentiles, was born of Jewish parents at Tarsus, in Cilicia, and inherited from them the rights of Roman citizenship. His original name was Saul. He was educated first in his native city, then in the zenith of its reputation for its schools of literature and philosophy, where he doubtless learned to speak and write Greek; and afterwards, to be perfected 'in the law of his fathers,' was sent to Jerusalem, where he

studied under Gamaliel, a great Jewish doctor, and became one of the strictest, most zealous, and most ardent Pharisees. Whether it was here or at Tarsus that he acquired his knowledge—which we have no reason to believe was ever very deep—of the philosophy and literature of Greece, cannot be ascertained. According to the wholesome rule observed among the Jews, that every person should learn some trade, Saul became a tent-maker, and at this trade he afterwards laboured (Acts xviii. 3) for his support. A few years after the death of Jesus, he became, as might have been expected from his training and temperament, a furious adversary of the new sect of Christians. We are told (Acts vi. 9) that the Jews of the Cilician synagogues at Jerusalem were among those who disputed with Stephen, and it is natural to suppose that the young and brilliant zealot, eager for disputation, was conspicuous among the crowd of Jewish students who poured out of their synagogues (of which, according to the Talmud, there were 480 in the holy city), in the insolence of their youth and scholarship, to crush the ignorant followers of the Nazarene. This supposition is rendered highly probable by the fact, that he was present at the martyrdom of Stephen, which followed almost immediately, having charge of the raiment of them that slew him. He now became a prominent actor in the great persecution of the Christians that broke out at Jerusalem. The mysterious circumstances that led to and attended his conversion are familiar to all readers of the Acts of the Apostles, and need not be recapitulated here. After a solitary sojourn in Arabia—perhaps to calm his perturbed spirit in communion with God, and to solemnly prepare himself for his new mode of life—on his return to Damascus, he changed his name to Paul, and resumed or began (it is not quite clear which) his apostolic labours. Naturally, he became an object of intense hostility to the unbelieving Jews in that city. They resolved to kill him; but his friends contrived a way of escape, and he fled to Jerusalem, where at first he was received with suspicion by the disciples, but afterwards, through the kind offices of Barnabas, with great cordiality. He now 'spoke boldly in the name of Christ,' disputing also against the 'Grecians'—i. e., the Hellenistic Jews—with dangerous success, for his opponents sought to take his life. Again he was obliged to flee, and betook himself to his birthplace, Tarsus, where he seems to have remained till Barnabas brought him to Antioch (not far off), to assist in the great work of evangelisation going on in that city. After a short visit to Jerusalem in the year of the famine, 44 A.D., they were set apart by the prophets and elders of the church at Antioch for the evangelisation of the more distant Jews. From Seleucia they proceed on their first missionary expedition to the southern districts of Asia Minor, Pamphylia, Pisidia, and Lycaonia, where they met, especially in some places, with considerable success, in preaching the gospel. It is very interesting to notice how gradually the light of Christianity dawned on the mind of the apostle. He did not grasp all at once its grand design. It was not even by abstract reflection that he arrived at it. Circumstances of quite an outward sort forced him to the sublime conclusions of his creed. It was when the Jews of Pisidian Antioch, enraged at his preaching the gospel indiscriminately to their Gentile fellow-townsmen and themselves, 'contradicted and blasphemed' him, that he boldly announced Christ as the universal Redeemer. After the return of P. and Barnabas to Antioch, they continued to labour in that city for a long time, till dissensions having arisen about the circumcision o

Gentile converts, he, along with Barnabas and others, was chosen to go up to Jerusalem, to get the opinion of the apostles and elders there on the question, about 51 A.D. P. and Barnabas now returned to Antioch, where they continued to teach and preach, till a yearning grew up in the heart of the former to revisit his Gentile converts in Asia Minor. In his second expedition, P. was accompanied by Silas instead of Barnabas, and traversed the whole of Asia Minor from south to north, evangelising with great success, after which the two missionaries crossed the *Ægean* and landed in Europe, planting at Philippi, the capital of Thracian Macedonia, the first Christian church in that continent. The details of his visits to Thessalonica, Berea, Athens, and Corinth are, doubtless, familiar to our readers, and need not be given here. We can only notice his appearance at Athens, where, on Mars' Hill, before a crowd of the citizens, among whom were Epicurean and Stoic philosophers, he delivered that magnificent discourse in which he declared to the Athenians the character of the 'unknown' God. On his return to Asia Minor he visited Ephesus, where, as usual, he 'reasoned' with the Jews in their synagogue; sailed thence to Cæsarea, in Palestine, and proceeded to Jerusalem 'to keep the feast,' after which he again returned to Antioch, the centre from which his operations radiated. Thus closed his second evangelistic journey.—The third journey of P. commenced probably about 54 A.D., and extended over much the same district as the previous one. At Ephesus, where he remained for a period of two years and three months, his efforts were powerfully seconded by the eloquence of the great Alexandrian convert, Apollos. Here it is recorded (Acts, xix.) that 'God wrought special miracles by the hand of Paul, so that from his body were brought unto the sick handkerchiefs or aprons, and the diseases departed from them, and the evil spirits went out of them.' In explanation of this very curious procedure, which has a disagreeable resemblance to ordinary legerdemain, it has been suggested, that as Ephesus was a city noted for its exorcisms, spells, and incantations—the famous *Ephesia Grammata* sold at a high price to the ignorant and superstitious populace—this style of miracle was an accommodation to their belief in magic and demonism, and intended to shew them, according to their own way of regarding things, the superiority of Christ's power to that of the evil spirits of heathen worship. From Ephesus, P. went up to Jerusalem with a presentiment that heavy evils were about to fall upon him through the ever-maddening malice of the Jews. The Jewish populace were goaded into the wildest fury by the very sight of Paul. The captain of the Roman guard, Claudius Lysias, had to interfere to save him from being torn to pieces; but as forty Pharisees had sworn neither to eat nor drink till they had taken his life, he was sent by night, under a strong escort, to the Roman governor, Felix, at Cæsarea, where he was unjustly detained a prisoner for two years. Having finally appealed to the Roman emperor, according to the privilege of a Roman citizen, he was sent to Rome. On the voyage thither, he suffered shipwreck at Melita (probably Malta), in the spring of 61 A.D. At Rome, he was treated with respect, being allowed to dwell 'for two whole years in his own hired house.' His first thoughts were, as usual, directed towards his Jewish brethren in the city; but, on the whole, he made little impression on them. Whether he ever left the city or not, cannot be positively demonstrated, but it is believed by many critics, from a variety of considerations, that he did obtain his liberty about 64 A.D., and that he made journeys both to the east

and to the west, revisiting Asia Minor, and carrying out his long-cherished wish of preaching the gospel in Spain, then thought to be the western limit of the world. Meanwhile occurred the great and mysterious burning of Rome, generally attributed to Nero. The latter threw the blame on the Christians, who were, in consequence, subjected to a severe persecution. Among the victims was P., who, according to tradition, suffered 67 A.D.—For an account of P.'s correspondence with the churches, see the articles on the different Epistles.

PAUL, the name of five popes, of whom the following appear to call for special notice.—PAUL III., whose pontificate falls upon one of the most critical periods in the history of the church, was originally named Alessandro Farnese, and was born at Carino, in Tuscany, in 1468. Having been created cardinal, he served in several important trusts, and eventually became Bishop of Ostia and Dean of the Sacred College. On the death of Clement VII., in 1534, he was elected pope, just at the crisis when the world was alive with expectation of the general council which was to decide all the controversies at that time agitating the public mind of Europe. After some delays, P. convoked the council to meet at Mantua in 1542; but it did not actually assemble (in Trent) until 1545. These delays are by some charged upon P.; but it can hardly be doubted that much of it was due to the difficulties of the times. The bull of excommunication and deposition which he issued in 1538 against Henry VIII. of England, is one of the last examples of the exercise of the temporal power claimed by the medieval popes. In the contest of Charles V. with the Protestant League in Germany, P. sent a large force to support him, and he opposed the pacification proposed by the emperor upon the basis of the INTERIM (q. v.). P.'s conduct in aggrandising the fortune of his son, Pietro Luigi Farnese, has been severely criticised by historians; the more so, that this son was born out of wedlock, in the early youth of his father. P. died November 10, 1549, in his 82d year.—PAUL IV., named John Peter Caraffa, a member of the noble family of that name, was born in Naples in 1476. His early career was distinguished for ascetic rigour. He was appointed Bishop of Chieti, in which see he laboured most earnestly for the reformation of abuses, and for the revival of religion and morality. With this view, he established, in conjunction with several congenial reformers, the congregation of secular clergy called THEATINES (q. v.), and was himself the first superior. It was under his influence that Paul III. organised the tribunal of the Inquisition in Rome. On the death of Marcellus II. in 1555, although in his seventy-ninth year, he was elected to succeed. He entered upon the wider career of reformation which his new position opened for him with all the ardour of a young man, and with all the stern enthusiasm which had characterised him during life. He enforced vigorously upon the clergy the observance of all the clerical duties, and enacted laws for the maintenance of public morality. He established a censorship, and completed the organisation of the Roman Inquisition; he took measures for the alleviation of the burdens of the poorer classes, and for the better administration of justice, not sparing even his own nephews, whom he banished from Rome, on account of their corrupt conduct and profligate life. His foreign relations, too, involved him in much labour and perplexity. He was embroiled with the Emperor Ferdinand, with Philip II. of Spain, with Cosmo, Grand Duke of Tuscany. Having condemned the principles of the Peace of Augsburg, he protested against its provisions. Under the weight of so many cares, his great age gave way

He died August 18, 1559, in his 84th year. At his death, the populace broke out into an insurrectionary tumult, which lasted till the conclave for the appointment of his successor.—PAUL V., originally named Camillo Borghese, was born in Rome in 1552. In his early life, he was a distinguished canonist and theologian; and after the ordinary prelatical career at Rome, he rose first to the post of nuncio at the Spanish court, and afterwards to the cardinalate under Clement VIII. On the death of Leo XI. in 1605, Cardinal Borghese was elected to succeed him. His pontificate is rendered memorable by the celebrated conflict with the republic of Venice, into which he was plunged at the very outset of his career. The original ground of dispute was the question of the immunity from the jurisdiction of civil tribunals conceded to the clergy, who claimed to be tried by ecclesiastical tribunals alone. This claim the senate resisted; and further causes of dispute were added by a mortmain law, and a law prohibiting the establishment of new religious orders or associations unless with the sanction of the senate. Each party remaining inflexible in its determination, P. issued a brief, directing a sentence of excommunication against the doge and senate, and placing the republic under an interdict, unless submission should be made within twenty-four days. The senate persisted, and an animated conflict, as well of acts as of writings, ensued in the latter of which the celebrated Fra Paolo Sarpi, on the side of the republic, and on the papal side, Bellarmino and Baronius, were the leaders. Preparations were even made for actual hostilities; but, by the intervention of Henry IV. of France, the dispute was accommodated, and peace restored in 1607, although dissatisfaction afterwards arose on the subject of the nomination of a patriarch. A misunderstanding of a similar nature arose between the pope and the crown in France as to the rights of censorship on books, and as to the receiving of the disciplinary decrees of the Council of Trent; but it was removed by mutual explanations. His administration was vigorous and enlightened, and he did a great deal for the promotion of useful public works, for the embellishment of the city, the restoration and preservation of antiquities, the improvement of the museums and libraries, and, above all, for the pious and charitable institutions of Rome. P. died in his 69th year, January 28, 1621.

PAUL, VINCENT DE, one of the most eminent saints of the modern Catholic Church, was born of humble parentage at Ranquines, in the diocese of Dax, in the year 1576. The indications of ability which he exhibited led to his being sent to school at Toulouse. He became an ecclesiastical student, and was admitted to priest's orders in 1600. On a voyage which he was making from Marseille to Narbonne, his ship was captured by corsairs, and he with his companions sold into slavery at Tunis, where he passed through the hands of three different masters. The last of these, who was a renegade Savoyard, yielded to the exhortations of Vincent, resolved to return to the Christian faith, and with Vincent, made his escape from Barbary. They landed in France in 1607. Having gone thence to Rome, he was intrusted with an important mission to the French court in 1608, and continued for some time to reside in Paris as the almoner of Marguerite de Valois. The accident of his becoming preceptor of the children of M. de Gondy, the commandant of the galleys at Marseille, led to his being appointed almoner-general of the galleys in 1619. It was at this time that the well-known incident occurred of his offering himself, and being accepted, in the place of one of the convicts, whom he found overwhelmed with grief and despair at having been obliged to

leave his wife and family in extreme destitution. Meanwhile he had laid the foundation of what eventually grew into the great and influential congregation of Priests of the Missions; an association of priests who devote themselves to the work of assisting the parochial clergy by preaching and hearing confessions periodically in those districts to which they may be invited by the local pastors. The rules of this congregation were finally approved by Urban VIII. in 1632; and in the following year the Fathers established themselves in the so-called Priory of St Lazare, in Paris, whence their name of *Lazarists* is derived. From this date, his life was devoted to the organisation of works of charity and benevolence. To him Paris owes the establishment of the Foundling Hospital, and the first systematic efforts for the preservation of the lives and the due education of a class theretofore neglected, or left to the operation of chance charity. The pious Sisterhood of Charity is an emanation of the same spirit, and Vincent was intrusted by St Francis of Sales with the direction of the newly-founded order of Sisters of the Visitation. The queen, Anne of Austria, warmly rewarded his exertions, and Louis XIII. chose him as his spiritual assistant in his last illness. He was placed by the queen-regent at the head of the *Conseil de Conscience*, the council chiefly charged with the direction of the crown in ecclesiastical affairs; and the period of his presidency was long looked back to as the golden era of impartial and honest distribution of ecclesiastical patronage in France. Vincent was not, in any sense of the word, a scholar, but his preaching, which (like that of the Fathers of his congregation of Lazarists) was of the most simple kind, was singularly affecting and impressive. He left nothing behind him but the *Rules or Constitutions of the Congregation of the Mission*, 1658; *Conferences on these Constitutions*, 4to; and a considerable number of letters, chiefly addressed to the priests of the mission, or to other friends, on spiritual subjects. He died at the advanced age of 85, at St Lazare, September 27, 1660, and was canonised by Clement XII. in 1737. His festival is held on the 19th July, the day of his canonisation.

PAUL (PETROWITSCH), Emperor of Russia, the second son of the unfortunate Peter III. and the Empress Catharine II., was born in 1754, became heir-apparent on the death of his elder brother in 1763, and succeeded his mother on the imperial throne in 1796. The tragical death of his father when he was still a child, and the neglect and want of confidence with which his mother treated him, exerted a baneful influence on the character of P., who was kept in compulsory seclusion while Catharine shared the administration of the government with her favourites. In 1776, P., on the death of his first wife, a princess of Hesse-Darmstadt, married the Princess Dorothea of Württemberg, by whom he had four sons—the late Emperors Alexander and Nicholas, and the Grand Dukes Constantine and Michael, and several daughters. After spending some years in travelling with his wife through Germany, France, and Italy, P. was recalled by his mother, who assigned to him the palace of Gatchina, 30 miles from St Petersburg, as his settled residence, while she took his children under her own immediate care. The death of the empress in 1796 released him from his unnatural restraint, and he ascended the throne with no practical acquaintance with the mechanism of government, and no knowledge of the people whom he was called to rule over. A determination to change everything that had existed under the previous reign, and to wreak vengeance on the murderers of his father, were the predominating influences that

guided his actions; and his earliest measures, which were the disgrace of his father's murderers, and the pardon of all Polish prisoners, gave hopes of a good reign; but the capricious violence of character and incapacity for business which P. betrayed, soon disappointed the hopes that he had awakened. No department of the state was free from his frivolous interference, and no class of the nation exempt from the effect of his arbitrary legislation. While he irritated the soldiery by vexatious regulations in regard to their dress, he offended the nobles by imperious enactments as to the ceremonials to be observed in his presence. His foreign policy was marked with similar caprice. After having adopted a system of neutrality in the war between France and the rest of Europe, he suddenly declared in favour of the allied powers, and sent an army of 56,000 men under Suwaroff into Italy. The success of his general encouraged him to send a second army of equal strength to co-operate with the Austrians; but their defeat in 1799 induced P. to recall Suwaroff with the Russian troops; and having retired from the allied coalition without having given any reason for his conduct, he quarrelled with England, because she would not comply with his whimsical demand for the surrender of Malta, and his own recognition as Grand Master of the Order of Malta, and entered into a close alliance with Bonaparte, who was then First Consul. The jealousy and hatred of England by which both were actuated, proved a powerful bond of union between them; and in furtherance of their scheme of uniting all the smaller maritime powers into one vast confederation against England, P. concluded a convention with Sweden and Denmark for the purpose of opposing the right insisted on by England of searching neutral vessels. The result was that the English government sent a fleet into the Baltic under Nelson to dissolve the coalition, at the close of March 1801. P. was preparing to give material aid to the Danes, when a conspiracy was formed at St Petersburg to put a stop to the capricious despotism under which all classes of men in Russia were groaning. The conspirators, whose numbers included Count Pahlen, the most influential man at court, General Beningsen, Uwarow, and many other distinguished nobles and officers, appear originally to have intended only to force P. to abdicate, but his obstinate disposition led to a scuffle, in which the emperor was strangled, March 24, 1801.

PAULDING, JAMES KIRKE, an American author, was born at Pleasant Valley, New York, August 22, 1779. His father was a farmer, descended from the early Dutch settlers. Self-educated, and early developing a tendency to literature, he was a friend of Washington Irving, and wrote a portion of *Salmagundi*. During the war of 1812, he published the *Diverting History of John Bull and Brother Jonathan*; in 1813, a parody of the *Lay of the Last Minstrel*, entitled *A Lay of the Scottish Fiddle*; and in 1814, a more serious work, *The United States and England*, a defence against articles in the *Quarterly Review*. This work attracted to him the attention of President Madison, and caused him to be appointed a member of the Board of Naval Commissioners. In 1817, he published a defence of the southern states and of slavery in *Letters from the South, by a Northern Man*; in 1819, a new series of *Salmagundi*; in 1822, *A Sketch of Old England*, by a *New England Man*; and in 1824, *John Bull in America, or the New Munchausen*, a satire on the writings of certain British tourists. This was followed by *Königsmarke*, a novel (1825); *Merry Tales of the Three Wise Men of Gotham* (1826); *The New Pilgrim's Progress* (1828); *Tales of a Good Woman* (1829); *Book of St Nicholas* (1830). These

works, mostly humorous and satirical, had various degrees of local popularity; but in 1831 he produced *The Dutchman's Fireside*, a novel that was reprinted in England, and translated into French and Dutch; and in 1832, *Westward Ho!* which attained to a similar popularity. These were followed by a *Life of Washington* (1835), *Slavery in the United States* (1836), in which the institution is defended on social, economical, and physiological grounds. He held at this period the lucrative post of Navy Agent at New York, and was by Mr Van Buren appointed Secretary of the Navy, which gave him the position of cabinet minister. At the close of Mr Van Buren's presidency in 1841, Mr P. retired to a country residence at Hyde Park, New York, where he wrote *The Old Continental*, a novel (1846); *The Puritan and his Daughter* (1849); and with his son, a volume of *Plays and Fairy Tales*. He died at Hyde Park, April 6, 1860.

PAULICIANS, an ancient sect of the Eastern Empire, who, by Catholic writers, are reckoned an offshoot of the Manichæans (q. v.). According to Peter of Sicily and Photius, the sect originated in Armenia from two brothers, named Paul (from whom it is alleged to have received its name) and John, who flourished in the 4th century. Others trace it to an Armenian named Paul, who lived under Justinian II. The P. were at all times treated with much suspicion, and repressed with great severity, by the eastern emperors; Constans, Justinian II., and Leo the Isaurian especially laboured to repress them, and indeed, with the exception of Nicephorus Logotheta (802—811), it may be said that all the emperors, with more or less rigour, persecuted them. Their greatest enemy, however, was Theodora (841—855), who, having ordered that they should be compelled to return to the Greek Church, had all the recusants cruelly put to the sword or driven into exile. A bloody resistance, and finally an emigration into the Saracen territory, was the consequence; and it is from the Paulician settlers in Bulgaria (Catholic historians) that the Manichæan doctrines which tinged the opinions of most of the mediæval sects, are supposed by Roman Catholic historians to have found their way into the eastern provinces of the Western Empire. Even so late as the 17th c., according to Musheim (ii. 238), there was a remnant of this sect existing in Bulgaria.

It is proper, however, to notice that a very different view of the character and doctrines of the P. has been advocated by such modern writers on ecclesiastical history as Gieseler and Neander, according to whom they had their origin from one Constantine of Mananalis (near Samosata), an Armenian, who had received a present of two volumes—one containing the four gospels, and the other the epistles of Paul—and who afterwards assumed the name of Paul, in testimony of his great veneration for that apostle. The distinctive characters of his doctrine and that of his followers were the rejection of the worship of the Virgin, the saints, and the cross, the denial of the material presence of Christ in the Eucharist, and the assertion of a right freely to search the Scriptures; and the charge of Manichæism was falsely brought against them by their persecutors.

PAULLINIA. See GUARANA BREAD.

PAUL'S (St) CATHEDRAL in London is noted from its being the largest and most magnificent Protestant church in the world, and second only to St Peter's in Rome among the religious structures of modern times. The site of the present building was occupied about 610 by a Christian church dedicated to St Paul. This church continued till 1083, when it

was destroyed by fire. From its ruins arose a much more splendid edifice—the immediate precursor of the present cathedral. In 1137, the building suffered severely from fire; but, that being the great age for splendid churches, it was soon restored with great magnificence, the bishops and the people contributing most liberally to defray the cost. Old St Paul's was the largest church in the country, being 690 feet in length, 130 in breadth, and about 150 feet high. The total height of the stone tower and the spire, covered with lead, which surmounted it, was 520 feet. The cloister was 90 feet square, with a beautiful chapter-house in the centre. In 1666, the great fire of London completely destroyed the old cathedral, along with a large portion of the city and most of the churches; and thereafter, Sir Christopher Wren was employed to design about 50 of the new churches, and, among others, the new cathedral. In 1673, he submitted several designs for a new cathedral to the king, who selected one, and ordered a model of it on a large scale to be prepared. This was done by Wren, and the model still exists. Its plan is in the form of a Greek cross, having a large dome over the centre, supported on eight arches. This was, however, eventually departed from; and the new design was modelled on that of a Gothic cathedral, with an interior length of 460 feet, width 240 feet across transepts, and a nave 94 feet wide. The dome, and the eight supporting arches of the model, are preserved; but in the new design the angle arches lead to no spacious compartment, but to small dark passages only; while the upper portions of these great arches are blocked up with other arches, introduced for constructive purposes, but very destructive of the architectural effect. The plan of supporting the dome on eight arches had the charm of novelty, and also of simplicity of construction, but it made the arches themselves too small in proportion to the great span of the dome. The constructive skill displayed by Wren in this building is universally acknowledged and admired, but it is thought that he has allowed the mechanical exigencies of the work to interfere too much with its decorative requirements. The dome, for example, is constructed on a new and most masterly principle, the thrust of the vault being counterbalanced by the weight of a brick cone, which is carried up to support the stone lantern over the exterior dome. But in order to carry this out with the least expenditure possible, the drum, or plain cylindrical wall under the dome, is sloped inwards, so that the columns with which it is decorated appear to the spectator below to be falling inwards, thus producing a painful and disagreeable effect. Great exception is taken to the fact, that the external dome is of wood, and not of stone, and so liable to premature decay; but the same may be said of the wooden roofs over the vaults of Gothic cathedrals; and by making it of wood, Sir Christopher was enabled to raise it to a height which makes it one of the noblest buildings of the kind in the world. The design of the nave, from the classic vaulting with which it is covered, is necessarily to a great extent a failure. When domes, or intersecting vaults, are used in a classic building, the compartments must be about square; there can therefore be but a small number of nave piers, as compared with those of a Gothic cathedral, and the perspective effect of the latter is thus entirely wanting. The same is the case at St Peter's. The dome is particularly successful, and is admitted to be the finest in existence; no other being so graceful and varied in outline and yet so massive in general effect. Its height from the pavement to the top of the cross is 404 feet. The west front, as seen from Ludgate

Hill, is most striking; the two campaniles group most harmoniously with the dome, and, together with the portico, produce a most pleasing and remarkable effect. This front must, however, be condemned, along with the screen-walls, if strictly criticised. The upper portico *appears* to indicate an upper story where there is none, and the actual construction and true form of the building are not expressed at all. St Paul's is the burial-place of many heroes and men of distinction, whose tombs are in the crypt, and whose monuments adorn the interior of the cathedral. Amongst these are Nelson and Wellington, Collingwood, Abercromby, Moore, Howe, St Vincent, Picton, Rodney, and many other celebrated soldiers and sailors; Howard, Johnson, Reynolds, Barry, Opie, West, Sir Astley Cooper, Sir William Jones, Sir Christopher Wren, and other distinguished civilians. Several of the monuments are by Flaxman, Chantrey, Bacon, and Rossi; but it must be confessed that they savour generally too much of heathen mythology, to be appropriate in a Christian cathedral.

PAULUS ÆGINETA, a celebrated Greek physician, was born in the island of Ægina, and flourished during the conquests of the Calif Omar in the 7th century. Of his life we know almost nothing more than that he pursued his medical studies first at Alexandria, and afterwards in Greece and other countries. His forte lay in surgery and obstetrics, in the latter of which departments of medicine his practice was great. He abridged the works of Galen, and was deeply read in those of Ætius and Oribasius, while he always exercised an independent judgment in forming his conclusions. His descriptions of diseases are brief and succinct, and also complete and exact. He often grounds his explanation of morbid phenomena on Galen's theory of the cardinal humours; while in surgery his writings abound with novel and ingenious views. His works—the principal of which is commonly called *De Re Medica Libri Septem* (Lond. 1834)—have passed through many editions, of which the best is that completed at Lyon in 1567, and they have also had many translators, of whom the best in English is Dr Francis Adams.

PAULUS DIACONUS (also called **PAULUS LEVITA**, both surnames being derived from his ecclesiastical office), one of the most learned men of his time, and the greatest Lombard historian, was born of a noble Lombard family at Friuli about 730. His father's name was Warnefrid. He received a superior education at Pavia, at the court of the Lombard king Ratchis, and appears to have continued at court during the reigns of his successors, Aistulf and Desiderius, and to have accompanied Adelperga, the daughter of Desiderius, whose education he had conducted, to the court of her husband, Duke Arichis of Beneventum. For her he wrote, in 781, after he had become an ecclesiastic, one of his principal works, his *Historia Romana*, a work of no authority, as it is a mere compilation from works which we possess, but which was greatly used during the whole of the middle ages, as the many manuscripts, recensions, and continuations of it, attest. An edition of the genuine text is still wanting, but a great part of it is given in Muratori's *Rerum Italicarum Scriptores*, vol. 1 (Milan, 1728). In 781, P. became a monk of Monte Casino; but afterwards went to France, and won the esteem of Charlemagne in a high degree by his character and learning. He aided that monarch in his schemes for the promotion of learning, and introduced the study of the Greek language into France. He made a collection of homilies from the best sources, at the emperor's desire, known as the *Homilium*, often

printed between 1482 and 1569, and translated into German and Spanish. At the request of Angilram, Bishop of Metz, he also wrote a history of the Bishops of Metz, *Gesta Episcoporum Mettensium* (printed in Pertz's *Monumenta Germaniæ Historica*, vol. 2), the first work of the kind on the north of the Alps, but the example of which was soon very generally followed. In 787, he returned to his convent, where he remained till his death, which is said to have taken place in 797. In the latter years of his life, he wrote his History of the Longobards (*De Gestis Longobardum*, Libri 6), but did not live to complete it, bringing down the history only to the death of Liutprand in 744. There are several editions of this work, the best of which is contained in the work of Muratori. It is characterised by remarkable candour, and a style unusually pure for that age. The high repute in which this work also was long held, is attested by the great number of manuscripts and continuations. P. was likewise the author of a number of theological works, and of some hymns and letters still extant.

PAULUS, HEINRICH EBERHARD GOTTLÖB, a German theologian of great note in his day, and one of the leaders of the Rationalists at the close of the last and the first quarter of the present century, was born at Leonberg, near Stuttgart, 1st September 1761. He gave himself to the study of oriental languages at Göttingen, and afterwards prosecuted it in London and Paris. In 1789, he was called to the professorship of Oriental Languages at Jena, and in 1793 became Professor of Geology, on the death of Döderlein. Here he especially signalised himself by the critical elucidation of the Scriptures of the Old and New Testament, in so far as they presented oriental characteristics. The results of his labours may be seen in his *Philologisch-kritischen und historischen Commentar über das Neue Testament* (4 vols. Lüb. 1800—1804); *Clavis über die Psalmen* (Jena, 1791); *Clavis über den Jesajas*, and other writings belonging to this period of his literary activity. In 1803, he removed to Würzburg; in 1808, to Bamberg; in 1809, to Nürnberg; and in 1811, to Ansbach. During these various changes, he had ceased to be a professor, and become a director of ecclesiastical and educational affairs; but in 1811 he accepted the professorship of Exegesis and Ecclesiastical History at Heidelberg. In 1819, he started a kind of historico-political journal entitled *Sophronizon*, in which he continued to write for about ten years. His contributions were marked by weighty sense, moderation, and knowledge of his various subjects, and won him great applause at the time. As a theologian, he is generally looked upon as the type of pure unmitigated rationalism—a man who sat down to examine the Bible with the profound conviction that everything in it represented as supernatural was only natural or fabulous, and that true criticism consisted in endeavouring to prove this. From his numerous writings, we select for mention the following: *Memorabilien* (Leip. 1791—1796); *Sammlung der merkwürdigsten Reisen in den Orient* (7 vols. Jena, 1792—1803); *Leben Jesu, als Grundlage einer reinen Geschichte des Urchristenthums* (2 vols. Heidelb. 1828); *Aufklärende Beiträge zur Dogmen-Kirchen- und Religionsgeschichte* (Bremen, 1830); and *Exegetisches Handbuch über die drei ersten Evangelien* (3 vols. Heidelb. 1830—1833). P. died 10th August 1851, at the advanced age of 90—having lived long enough to see his own rationalistic theory of Scripture give place to the 'mythical' theory of Strauss, and that in its turn to be shaken to its foundations partly by the efforts of the Tübingen school, and partly by those of Neander and the 'Broad Church' divines of Germany. See P.'s *Skizzen aus meiner Bildungs- und Lebensgeschichte*

zum Andenken an mein 50-jähriges Jubiläum (Heidelb. 1839), and Reichlin Meldegg's *H. E. G. Paulus und Seine Zeit* (2 vols. Stuttg. 1853).

PAUPER COLONIES are establishments at Frederiksoord and Veenhuizen in the Netherlands, province of Drenthe, and at Willemsoord and Ommerschans in Overijssel. They were erected by a benevolent society for the purpose of employing poor people in cultivating land and various industries. In 1858, the society suspended payments and the state took the temporary management, arranged with the creditors, finally retaining Ommerschans and Veenhuizen, leaving Frederiksoord and Willemsoord to be governed by the society.

On 1st January 1860, the government colonies contained 6034 persons, of whom 4407 had been beggars. There were 41 farms, 15 factories and workshops, with churches and schools. The stock consisted of 104 horses, 508 cows, 1259 sheep, &c., and the breadth of land in culture extended to 1454 acres in rye, barley, oats, and buckwheat, 741 in potatoes, and 1124 in grass. Peat is extensively cut; half a million coffee-bags are made annually, &c. These institutions are kept up at a considerable expense to the nation, but have been successful in reducing the numbers and improving the social condition of many of the destitute poor.

The colonies of the benevolent society extend to 4942 acres, and the inhabitants are either tenant cotters, with about 7 acres of land attached to each house, or labour for the society. In 1863, there were 259 cotter families, paying for house, garden, land, and the use of a cow, a yearly rent of about £5, 17s. Those who are not required for the land, work in the factories, weaving cottons, bagging, coarse linens, making baskets, mats, &c. There are two Protestant churches, a Roman Catholic chapel, and a synagogue. The society's colonies have never been self-supporting, and are partly maintained by the yearly contributions of members, gifts, legacies, &c.; the total receipts, from all sources, in 1862, amounting to £37,000, and the expenditure to £34,000. Pop. 2611. In 1863, there were 5079 members who contributed £1378; and the property, stock, &c., of the society are valued at £74,000. The colonists have been greatly improved in position, and their houses shew signs of industry and comfort. When working in the factories, a tenth part of their weekly earnings is placed in a reserve fund, which is paid out to them in winter or in time of sickness.

PAUSANIAS, a famous Spartan regent and general, the son of Cleombrotus, and nephew of Leonidas. He commanded the confederate Greeks in the important battle of Plataea (479 B.C.), in which the Persians were totally routed, and their leader, Mardonius, slain. He then marched his troops against Thebes, and compelled the inhabitants to give up the chiefs of the Persian party to him for punishment. Elated by this victory, however, he became in an extreme degree haughty and vain-glorious, took all the credit to himself, and allowed none to the Athenian generals, Aristides and Kimon, who commanded under him, and treated all the other Greeks as if the Spartans were their lords. Nevertheless, he still continued his conquests, capturing Cyprus and Byzantium. It was here he first began to play false to Greece. He entered into secret negotiations with Xerxes, with the view of becoming ruler, under the Persian monarch, of the whole country, and in his journey through Thrace, even adopted the dress and luxurious habits of a Persian satrap, and surrounded himself with a body-guard of Persians and Egyptians. Being recalled, on account of these things, by the Spartans, his form

services procured his acquittal. He then returned to Byzantium, where he renewed his traitorous intrigues, was expelled from the city for a criminal assault upon a Byzantine lady, withdrew to the Troad, and there continued his treachery. He was a second time called to account by the Spartan ephors, but again escaped, though with greater difficulty. Yet his passion for the sovereignty of Greece, even though at the expense of the national liberties, once more drove him to play the traitor. He tried to stir up the Helots, but was taken in his own net. A Helot betrayed him. When P. found his position desperate, he took refuge in a temple of Athene. Hereupon the people blocked up the gate of the temple with heaps of stones, and left him to die of hunger, his own mother depositing the first stone.

PAUSANIAS, one of the most eminent of Greek geographers and historians, was probably a native of Lydia in Asia Minor, and was born some time in the 2d century. He travelled through almost all Greece, Macedonia, and Italy, and also through part of Asia and Africa, and composed from his observations and researches an Itinerary, entitled *Hellados Periegesis*, in ten books, describing the different parts of Greece, and giving a particular account of the monuments of art and of the legends connected with them. His style is by no means pure; but in matters of his own observation he is most trustworthy, and his work is, on many subjects, one of the most valuable sources of information that we possess. There are numerous editions of his work; the oldest was printed at Venice in 1516 by Aldus; and the most recent is that by J. H. O. Schubart and C. Walz (3 vols. Leip. 1838—1840. Translations of P. exist in English, German, and French.

PA'VEMENT, flat stones or 'flags' used for the flooring of halls, kitchens, and other apartments, and frequently for footpaths; also the stone covering of the roadway of streets. The stones used for flags vary in different districts, according to the geological formation of the neighbourhood. The pavements now most commonly used in England and Scotland are the Arbroath and Caithness stones—the former a softer and more agreeable stone than the latter, which is exceedingly hard and slippery when wet. Pavement should be carefully laid on a solid dry foundation, and set in a good bed of concrete or lime, and the joints pointed with cement. It may also be laid on small dwarf walls, built of brick, so as to support all the edges—this is a good method for keeping the floor dry.

The **PAVING OF STREETS** is of early date, and is, in fact, necessary to any considerable degree of civilisation and traffic. The Romans paved their streets in the same elaborate and solid manner in which they paved their highways. See **ROADS**. Portions of the ancient pavement of the streets of Rome are in use to the present day, and the pavement of Pompeii remains entire. It is laid with large blocks of stone of polygonal shape (like Cyclopean masonry), very carefully fitted together, and of considerable depth, and below there is a carefully prepared basis, often composed of several distinct strata. Some of the Italian towns—Florence, for instance—have still pavement of this description, and no foot-pavement.

The mediæval cities were almost all unpaved till about the 12th c., when the main streets of the chief towns began to be protected with stone. The plan now adopted is nearly the same in all the cities of Europe. The first thing to be done is to secure or make a solid foundation. This is done, where the natural substratum is not of a solid-kind,

by laying the street with a solid bed of concrete, having a slope from the middle to the sides to throw off the water. On the concrete is placed the real pavement, which is composed of blocks of granite, trap, or other tough rock. These should be rectangular, and the deeper the better. They are generally about 10 inches to 12 inches in depth, and 6 inches or 7 inches broad, and from 1 to 2 feet in length. They should be all bedded and jointed in strong mortar. This is not often done, as it is thought sufficient to bed the stones in sand, and grout them with hot lime on the top. It is clear, however, that the more equal the stones are in depth, and the more solidly they are bedded, the longer they will last. Other materials besides stone have been tried for the paving of streets—such as blocks of wood with the end up, and blocks of cast iron. The wooden pavement is delightfully easy, and not noisy, but in wet weather it is exceedingly slippery. Cast-iron is too hard, and causes too much jolting and noise.

The great obstacle in the way of really good pavement in modern streets is the necessity of frequently breaking it up for the laying and repairing of pipes for gas, water, &c. The true remedy—and, in the end, the cheapest—would be to have, in the chief streets at least, sub-ways or tunnels for drains and pipes, accessible without breaking up the pavement.

PA'VIA, a city of Northern Italy, capital of the province of the same name, on the left bank of the Ticino, 20 miles south of Milan, and 3 miles above the confluence of the Ticino and the Po. A covered bridge of eight arches connects the city with the suburb of *Borgo Ticino*, on the right bank of the river, and from this bridge the *Sirada Nuova*, or *Corso*, the principal thoroughfare, leads north, and extends to the outskirts. The city is large, surrounded by walls, and has an imposing appearance, bearing the impress of antiquity. In former times, it was called the 'city of a hundred towers;' but the palace of Theodorice, and the tower where Boethius wrote the treatise *De Consolatione Philosophiæ*, no longer exist; among the remaining ones are those of Belcredi and Del Maino, which are each 169 feet high. Its oldest church, and perhaps the oldest in Italy, is that of San Michele, which, although the date of its foundation is uncertain, is first mentioned in 661. The cathedral, containing some good paintings, was commenced in 1484, but was never finished. In a beautiful chapel attached to it, are the ashes of St Augustine, in a sarcophagus ornamented with 50 bassi-rilievi, 95 statues, and numerous grotesques. In the Church of San Pietro in Ciel d'Auro are deposited the remains of the unfortunate Boethius. The Certosa of P., the most splendid monastery in the world, lies four miles north of the city. It was founded in 1396, contains many beautiful paintings, and abounds in the richest ornamentation. It has an octagonal cupola, painted ultramarine, and enamelled in gold. It was sacked by the French in 1796. Its church is in the form of a Latin cross, and is 249 feet long, and 173 feet wide. The university of P. is said to have been founded by Charlemagne in 774, and was one of the most famous seats of learning during the middle ages. Its efficiency was much increased by Galeazzo Visconti, who bestowed many privileges upon it in the year 1396. It consists of numerous colleges, and attached to it are a library of 120,000 vols., a numismatic collection, anatomical, natural history, and other museums, a botanic garden, a school of the fine arts, &c. The university is attended by about 1600 students. It has numbered among its professors Alciati, Fidefio, Spallanzani, Volta, Scarpa, Foscolo, and Monti.

The other chief edifices comprise private palaces, theatre, gymnasium, &c. P. carries on a good trade in wine, rice, silk, and cheese. Pop. 29,836.

P., the ancient *Ticinum* (afterwards *Papia*, whence the modern name), was founded by the Ligurii; it was sacked by Brennus and by Hannibal, burned by the Huns, conquered by the Romans, and became a place of considerable importance, at the end of the Roman empire. Then it came into the possession of the Goths and Lombards, and the kings of the latter made it the capital of the kingdom of Italy. It became independent in the 12th c., then, weakened by civil wars, it was conquered by Matthew Visconti in 1345. Since that period, its history is merged in that of the conquerors of Lombardy. Here, in 1525, the French were defeated by the imperialists, and their king taken prisoner; but in 1527, and again in the following year, it was taken and laid waste by the French. It was stormed and pillaged by Napoleon in 1796, and came into the possession of Austria by the peace of 1814. Since 1859, it has been included within the re-organised kingdom of Italy.

PAVIA. See HORSE-CHESTNUT.

PAVILION, a portion of a building, under one roof, of a tent-like form, with the slope of the roof either straight or curved. This form is much used in France—the higher parts of the new buildings at the Louvre are good examples of pavilions. Pavilion roofs are sometimes called French roofs.

PAVLOGRAD, a town of South Russia, in the government of Ekaterinoslav, and 38 miles east-north-east of the town of that name, on the Voltcha, an affluent of the Dnieper. It was founded in 1780, during the reign of the Empress Catharine II., and its first colonists were the Zaporogsky Cossacks. But in 1782, a great portion of the English garrison of Fort Magon in Minorca, having been subdued by the Spaniards, and being forced by the terms of their capitulation to renounce the English service, obtained liberty from the Empress Catharine to settle in Pavlograd. The garrison was composed chiefly of Corsicans. Pop. of the town about 10,000.

PAVO'NIDÆ, a name sometimes used by ornithologists to designate the family of gallinaceous birds more commonly called *Phasianidæ* (q. v.), sometimes applied as a designation to a portion of that family separated from the rest on very slight grounds, the chief distinction being the greater expansion of the tail. See PEACOCK and POLYLECTRON.

PAWL, on shipboard, is a catch or hook to prevent the capstan from flying round backwards during a pause in the heaving. A similar catch is used in the common windlass.

PAWNBROKING (Du. *pand*, Ger. *pfand*, Fr. *pan*, a pledge). The business of lending money on pawns or pledges appears to have been carried on in England by certain Italian merchants or bankers as early at least as the reign of Richard I. By the 12th of Edward I., a message was confirmed to these traders where Lombard Street now exists; the name being, according to Stow, derived from the Longobards who used to congregate there for business purposes. Subsequently, these merchant adventurers became known generally by the name of Lombardens. Their wealth became proverbial. Among the richest of them were the celebrated family of the Medici; from whose armorial bearings it is conjectured that the pawnbroking insignia of the three balls have been derived. The bankers of Lombard Street appear to have exercised a monopoly in pawnbroking until the reign of Elizabeth. The trade is first recognised in law by the act 1st

James I. c. 21. In the perilous days of Charles I. the goldsmiths were very frequently chosen as the custodians of plate and money; which circumstance seems to have suggested to them the profitable business of lending on pawns and discounting bills. From this time, the oppression and extortion often exercised by brokers have continued to attract much public attention and discussion; and an effort has been made, both in England and on the continent, to obviate the evil by the establishment of what are called Monts de Piété, the object of which is to advance small sums to the very poor at a moderate interest. See MONT DE PIÉTÉ. In England, after many abortive efforts, a Mont de Piété office was started in 1708; but in 1731 it came to a disastrous end. The bubble mania of 1824—1825 gave rise to a similar scheme. In this instance upwards of £400,000 was subscribed; but the undertaking miscarried, and the capital was lost. A similar fate attended the Irish Monts de Piété, of which there were eight in 1841. In 1848, they had all disappeared except one, which lingered to 1853; when it also expired. It would thus seem hopeless to attempt to establish a pawnbroking office in England on any other footing than an ordinary commercial one. The cause of failure will be found to lie, generally, in the great difficulty of conducting a commercial undertaking on charitable principles, with sufficient energy and ability to compete successfully with others originating in the ordinary motives which lead men to engage in trade.

It hardly admits of dispute that the pawn-shop, in its practical working, is an evil—necessary, it may be, but still an evil; and the having recourse to it is strongly to be discouraged. There are, doubtless, cases where men are driven to pawn their goods from causes which are not discreditable, and which do not render it certain that they are on the road to ruin; but such cases are rare exceptions to the general rule. Besides making borrowing too easy, and thus encouraging the fatal habit of anticipating income, the pawn shop is, in nine cases out of ten, the door to the drinking-shop. Even where the one does not directly lead to the other, it generally does so in the end. That 'borrowing dulls the edge of husbandry' applies with a force increasing in a geometrical ratio as we descend in the scale of society. Admitting, however, that with all its tendency to demoralise, pawnbroking is, in many cases, of value in tiding over unforeseen pecuniary difficulties, it is sufficient to say, that so long as improvidence prevails among large classes of society, and so long as even the most prudent are liable to unforeseen accidents, the accommodation of the pawn-shop is to a certain extent a necessity, and like other demands of the public will continue to be supplied. Nor are those who supply this demand to blame, any more than the caterers for many other expenses which economists pronounce to be wasteful. The fault, where there is a fault, is in those who borrow, not in those who lend. The legislature, accordingly, instead of trying to put down pawnbroking, has wisely confined itself to putting it under stringent regulations so as to prevent as far as possible its abuse.

Pawnbrokers are restricted in their business by various acts of parliament, some of which were passed before the recent abolition of the Usury Acts. The chief statute is the 39 and 40 Geo. III. c. 99, which requires them to take out a licence (for which they pay £7, 10s., and if they deal in silver-plate, £5, 15s. additional), fixes the rate of interest, and makes it necessary that a table of interest should be put up in a conspicuous part of the shop, to keep books with correct entries of the name and place of abode of the owners

of goods, &c. If the owner of goods has just cause to suspect that such goods have been pawned at a particular shop, the justices of the peace may grant a search-warrant, and if found, the goods must be restored to the owner. Pawnbrokers are expressly prohibited from taking in pledge goods of manufacture in an unfinished state, and also any goods under circumstances which ought to have aroused their suspicions. Goods which have been in pledge for a year may be sold, unless notice not to sell be given before the expiration of the 12 months, in which case three months more are allowed to the owner to redeem them. If the duplicate is lost, the owner of the goods may obtain a fresh one on verifying the fact of his being the owner before a justice of the peace. If the money borrowed be tendered with interest within the year, the pawnbroker is bound to deliver them up, otherwise a justice of the peace may by order compel him to do so. The mode of selling forfeited goods is prescribed by the statute to be by auction, and at four times in the year—the catalogues to contain the names of the pawnbrokers, and the month when the goods were pawned and the number entered in the pawnbroker's books. The result of the sales is to be entered in the books of the pawnbroker and auctioneer, and the surplus is to be paid on request to the owner of the goods after deducting the costs of the sale. Pawnbrokers are not to take goods in pawn from persons under the influence of drink, or under the age of 16, nor after certain hours, according to the season of the year. In case of penalties imposed on pawnbrokers for offences against the act, these, in several cases, or parts of them, are made payable for the benefit of the poor of the parish. A pawnbroker is, by an act which came into operation January 1, 1873, liable to the owner of the goods for 25 per cent. on the sum lent in case of fire occurring on the premises.

The greatest pawnbroking establishment in the world is the Mont de Piété of Paris. It trades with borrowed capital, and with the profits of former years. By the most recent statistics at hand it is reported to have received in one year 1,431,575 pledges, valued at £1,036,371, including renewals, and the average charge was about 15 per cent. per annum. Taking one of the largest offices in England out of London, we find that in one year it received 142,835 pledges, valued at £36,560, including renewals, and the average charge was 25 per cent. per annum. Various circumstances render the difference between the rates really much less than these figures indicate; still there is no doubt that the interest charged on small loans is lower at the Mont de Piété of Paris than in the pawnbroking offices in this country; but this convenience is limited by the fact of the French establishment taking no loans under three francs.

What is called in England the 'dolly shop,' and in Scotland the 'wee pawn' system is carried on by brokers, ostensibly buying and selling. They receive articles as bought; there being a distinct understanding that the seller is to have an opportunity of repurchasing within a limited time, at an understood increase of price. The general understanding as to charge is a penny per shilling per week; a month being usually allowed to redeem the article. The 'wee' broker is commonly resorted to because the article is one which the regular dealer will not take, or will not give so high an advance upon.

PAWTUCKET, a town of Rhode Island, U. S., on both sides of the Pawtucket River, 4 miles north of Providence. A fall of 50 feet on the river, and its proximity to the sea, caused it to be selected by Samuel Slater, in 1790, as the site of the first cotton

factory in the United States. It now contains 11 cotton mills, 13 machine shops, 3 furnaces, and manufactures of fire-engines, belting, jewellery, &c. There are 15 churches, 6 banks, 1 newspaper, a public library, with extensive steamboat and railway connections. Pop. (1880) 19,030.

PAX, called also PACIFICALE and OSCULATORIUM (Lat. *osculator*, I kiss), the 'Kiss of Peace,' and also a sacred utensil, employed in some of the solemn services of the Catholic Church in the ceremony of giving the so-called 'kiss of peace' during the mass. The practice of saluting each other—the men, men, and the women, women—during public worship, and particularly in the *agape*, or love-feast, is frequently alluded to by ancient writers, as Cyril of Jerusalem, Catech. xv., and St Augustine, Sermon 227. All the ancient liturgies, without exception, refer to it as among the rites with which the Eucharist was celebrated; but they differ as to the time and the place in the Eucharistic service in which it is introduced. In the Eastern liturgies it is before, in the Western after the Offertory (q. v.); and in the Roman it immediately precedes the communion. The ceremony commences with the celebrating bishop or priest, who salutes upon the cheek the deacon; and by him the salute is tendered to the other members, and to the first dignitary of the assistant clergy. Originally the laity also were included, but this has long since been abandoned. It is when the mass is celebrated by a high dignitary that the utensil called the pax is used. The pax is sometimes a crucifix, sometimes a reliquary, sometimes a tablet with a figure sculptured or enamelled upon it. Having been kissed by the celebrant, and by him handed to the deacon, it is carried by the latter to the rest of the clergy. In ordinary cases, the pax is given by merely bowing, and approaching the cheek to the person to whom it is communicated. The pax is omitted in the mass of Maundy-Thursday (q. v.), to express horror of the treacherous kiss of Judas.

PAXO, one of the Ionian Islands, lies 10 miles south-west of the coast of Albania, and 9 miles south-south-east of the island of Corfu. It is about 5 miles long, and about 2 miles broad. The capital, or rather the chief village, is Port Gaio (pop. 2000), on the east coast. Olives, almonds, and vines are grown, and the island is famous for its oil. Water is sometimes very scarce. Pop. of the island about 3500.

PAXTON, Sir JOSEPH, English architect and horticulturist, was born at Milton-Bryant, near Woburn, Bedfordshire, in 1803. He was sent to Woburn Free School, but left it at an early age, and obtained employment as a working gardener. He entered the service of the sixth Duke of Devonshire, at Chiswick, and was thence transferred to Chatsworth, where he became the duke's chief gardener. His abilities as a horticulturist found ample scope in the beautiful gardens of Chatsworth, and are further attested by *Paxton's Magazine of Botany*, of which he was editor, as well as other works on plants and flowers. The experience he obtained in designing capacious glass conservatories at Chatsworth led him to propose a Crystal Palace of glass and iron for the Great Exhibition (q. v.) of 1851. It was the first time these materials had been employed on so extensive a scale, and visitors found an inexhaustible theme of admiration in a fairy palace so novel, beautiful, and magnificent. His design obtained for him great popularity and the honour of knighthood. The Crystal Palace of 1851 was removed from Hyde Park, but became the germ of the nobler and more

splendid Palace at Sydenham, the construction of which he superintended; the grounds were also laid out by him. Crystal palaces for exhibitions of artistic and industrial objects have since 1851 been constructed at Dublin, New York, Paris, Manchester, &c. In 1854, P. was returned to parliament on the liberal interest for Coventry, which he represented for about ten years. He was a member of many learned societies in Europe, and his works on horticulture and botany are much esteemed. He died in 1865.

PAYMASTER-GENERAL is an officer of the British ministry, but not of the cabinet, charged with superintending the issue of all moneys voted by parliament. He is virtually the paymaster of the public service, having no control over the sums issued, and paying merely on the order of the department concerned. The salary of the office is £2000 per annum.

The United States Paymaster-General is an officer of the War Department, who has charge of the disbursements to the regular army and the Military Academy. Prior to May 1, 1869, he had charge of additional bounty claims pending and unsettled at that date. He has in his employ sixty regular paymasters, employed in the payment of the army at the 289 military stations scattered over vast territories, from Maine to California, and from Alaska to the Gulf of Mexico. His disbursements, during the year ending June 30, 1869, were for regular troops, \$18,678,250; Military Academy, \$185,258; volunteers, \$19,918,635; transferred to other paymasters, \$41,819,441.

PAYMASTER, BRITISH MILITARY AND NAVAL.—Military paymasters are either 'District' or 'Regimental.' Of the latter, who constitute by far the more numerous class, there is one to every brigade of artillery, regiment of cavalry, and battalion of infantry. The paymaster holds no other commission, but the appointment is nearly always conferred upon some person who has previously held a combatant rank in the army. The functions of paymaster comprise issuing and accounting for the pay of officers and men, and having charge generally of all the finances of the corps. In discipline, the paymaster is responsible to the officer commanding the regiment; but in all money matters he looks for orders to the War Office alone. He commences with a pay of 12s. 6d. a day, with the relative rank of captain; and after twenty years' service attains the pay of £1, 2s. 6d. a day and relative rank as major. Regimental paymasters were first appointed during the French war.

District paymasters have financial charge in recruiting districts. They are usually old officers, and receive each 2s. 6d. a day more than the rates of regimental pay. Both in districts and regiments army paymasters have to provide security for the faithful discharge of their duty.—The NAVAL PAYMASTER is for a ship what the military paymaster is for a regiment; but he adds to those duties some of those performed in the army by the quartermaster, commissariat, and military storekeeper, for he has charge of the provisions, clothing, and miscellaneous stores, as well as of mere money. Paymasters are commissioned officers, receiving from £1, 12s. 11d. to 13s. 8d. a day, and ranking, according to service, with captains, commanders, and lieutenants. Up to the year 1844 paymasters were styled pursers, and were paid by profits they made on certain of the ship's charges. At a still earlier period these pursers had been warrant-officers.

PAYMASTER-SERGEANT, in the army, is a non-commissioned officer, whose duty it is to act as clerk to the paymaster. He ranks with other staff-sergeants, and receives from 2s. to 3s. a day, according to his corps, with an increase of 6d. after

seven years' uninterrupted service as paymaster-sergeant.

PAYNISING, a process for preserving and hardening wood, invented by a Mr Payne. It consists in placing well-seasoned timber in an air-tight chamber, and then, when, by means of a powerful air-pump, the wood is deprived of its air, a solution of *sulphuret of calcium*, or of sulphuret of barium is admitted, and readily fills up the empty vessels all through the wood. The air-pump is again used, and the superfluous moisture is drawn out, and a solution of sulphate of iron is injected; this acts chemically upon the sulphuret of barium or of calcium, and forms all through the wood either the insoluble sulphate of barium (heavy spar) or of lime (gypsum). This renders the wood very heavy, very durable, and almost incombustible.

PAZ DE AYACHUCO (LA). See SUPP. in Vol. X.

PEA (*Pisum*), a genus of plants of the natural order Leguminosæ, suborder Papilionaceæ, closely allied to the genus *Lathyrus* (q. v.), from which it differs chiefly in the triangular style. Two species, supposed to be natives of the south of Europe and of the East, are very extensively cultivated for their seeds (peas), which are the best of all kinds of pulse; the COMMON PEA or GARDEN PEA (*P. sativum*) in gardens, and the FIELD PEA (*P. arvense*) in fields; both of them climbing annuals, with pinnate leaves, ovate leaflets, and branching tendrils in place of a terminal leaflet; the Garden Pea distinguished by having two or several flowers on each flower-stalk, the flowers either red or white, more generally white, and the seeds subglobular; the Field Pea having one flower on each flower-stalk, the flowers always red, and the seeds angular from crowding and compression in the pod. But it is not improbable that they are truly one species, of which the Garden Pea has, through cultivation, departed furthest from the original type. Peas have been cultivated in the East from time immemorial, although the ancient Greeks and Romans do not seem to have been acquainted with this kind of pulse, the cultivation of which was apparently introduced into Europe very early in the middle ages; and its cultivation extends from warm climates, as India, even to the Arctic regions, the plant being of rapid growth and short life. The seeds of the Garden Pea are used for culinary purposes both in a green and in a ripe state; also the green succulent pods of some varieties, known as Sugar Peas or Wyker Peas, in which the membrane lining the inside of the pod—parchment-like in most kinds—is much attenuated. Field peas are used both for feeding cattle and for human food. For the latter purpose, peas are often prepared by being *shelled*, or deprived of the membrane which covers them, in a particular kind of mill; they are then sold as *Split Peas*, and are much in use for making *Pea Soup*. They are also ground into meal, which is used in various ways, chiefly for making a kind of pottage and of unleavened bread. In the countries bordering on the Mediterranean, peas are roasted in order to eating.

There are innumerable varieties both of the Field Pea and the Garden Pea, those of the latter being so much the products of horticultural art, that they cannot be preserved without the utmost attention. Some of the kinds of garden peas have long stems, and require for their support stakes of six or eight feet in height; others are of humbler growth; and certain dwarf kinds, preferred as most convenient in many gardens, succeed very well without stakes. The largest kinds are sown in rows about four feet asunder. In Britain and America, garden peas are sown at different times from February to June, in order to

secure a supply of green peas during a considerable part of the summer. In the southern parts of Britain they are also sown in the end of autumn, a very little protection being sufficient for them during the winter. Certain small kinds, of very rapid growth, known as *Early Peas*, are preferred for the first sowings, although less productive than many others. The varieties known as *Mammoth Peas* are remarkable for their size and tenderness in a green state, but shrivel as they ripen.

Branches of trees are generally used for pea-stakes, when they can be obtained, and nothing can be better; but in lieu of them, strings are sometimes stretched between poles along the rows. Field peas are sometimes sown alone, and allowed to support each other, where the soil is not very rich, but are very generally sown with oats, to which they cling.

Chalky and other calcareous soils are particularly suitable for peas, and in other soils a good field crop is seldom obtained unless the land has been well limed, or manured with gypsum. The free use of lime is supposed, however, to be unfavourable to the quality of garden peas intended to be used green.

Peas are cultivated to a considerable extent as a field crop in Britain, but are best adapted to those districts in which the climate is least moist, the seeds being very apt to grow in the pods when moist weather prevails in autumn, by which the crop is injured or destroyed. The most productive kinds, being also in general the most bulky in straw, are very apt to lodge before the pods are filled, in wet seasons, and particularly on rich land. They are also grown in the northern United States.

The haulm or straw of peas is used for feeding cattle; and for its sake, field peas are often reaped before they are quite ripe, great care being taken in stacking the straw to provide for ventilation, so that it may not *heat*. Pea haulm is more nutritious and more nutritious than hay.

Land to be sown with field peas should be very *clean*, and in particular free of couch grass; otherwise the best management cannot prevent its becoming more foul whilst bearing the pea crop. The seed ought always to be sown in rows, twelve inches apart, or, in rich soils, eighteen or twenty inches apart. Various means are employed for sowing peas; they are not unfrequently ploughed under each second furrow; but the seed ought not to be buried more than four inches under the surface, and indeed that depth is too great; although many farmers sow their peas deeper than they otherwise would, to place them beyond the reach of wood pigeons. All possible means ought to be used to keep the land free of weeds. In some districts, peas are generally sown broadcast, which renders it impossible to do anything for this purpose. In the harvesting of peas, the sheaves are generally left loose till the haulm is somewhat dry.

Numerous varieties of peas have been grown in the United States. Among these may be named the Oregon pea, producing a very rich seed and abundant haulm adapted to cattle forage, and the Japan pea, which is enormously productive. The Cow pea of the southern states is highly esteemed as an adjunct in fertilising the soil.

Besides being one of the most important agricultural crops of Great Britain, peas are largely imported into England, the quantity sometimes reaching 120,000 quarters. They are received from Denmark, Prussia, Germany, Holland, Morocco, the United States, and British North America; and of these, Denmark and the British North American colonies send the greater part. As an article of

food, if not taken too often or without other food, peas are very valuable, as they contain a large percentage of *casein*, which is a flesh-forming principle. This principle in the pea has been called *legumin*, but chemists are now generally agreed that it is identical with the casein of cheese. The following is an analysis of one hundred parts of pea meal:

Water,	14.1
Casein,	23.4
Starch,	37.0
Sugar,	2.0
Gum,	9.0
Fat,	2.0
Woody Fibre,	10.0
Mineral Matter,	2.5
	100.0

The unripe peas of the garden varieties are amongst our most esteemed vegetables, and the meal of the white or yellow varieties used in soups is a highly nutritious and agreeable food.

A plant found on some parts of the shores of Britain, as well as of continental Europe and North America, and known as the *SEA PEA*, has been commonly referred to the genus *Pisum*, and called *P. maritimum*, although botanists now generally refer it to *Lathyrus*. It much resembles the common pea; has large reddish or purple flowers on many-flowered stalks; and its seeds have a disagreeable bitter taste. Its abundance on the sea coast at Orford, in Sussex, is said to have saved many persons from death by famine in 1555.—The other species of *Pisum* are few. But the name *Pea* is often given to species of other papilionaceous genera. The *SWEET PEA* and *EVERLASTING PEA* are species of *Lathyrus*. The *CHICK PEA* (q. v.) is a species of *Cicer*.

PEABODY, GEORGE, an American merchant, whose name deserves to be held in remembrance on account of his munificent philanthropy, was born at Danvers, Massachusetts, February 18, 1795. His parents were poor, and his only education was received at the district school. At the age of 11 he was placed with a grocer, and at 15 in a store in Newburyport. Visiting England in 1827 to buy merchandise, he transacted financial business for the state of Maryland. In 1837 he removed to London, and in 1843 became a banker, and accumulated a large fortune. He did not forget his humble origin or place of birth. In 1852, on the 100th anniversary of the corporate existence of his native town, he sent home \$20,000 to found an Educational Institute and Library, a sum he afterwards increased to \$200,000, with \$50,000 to North Danvers. He also contributed \$10,000 to the first Grinnell Arctic Expedition, \$1,400,000 to the city of Baltimore for an Institute of Science, Literature, and the Fine Arts; and in 1863—9, he made the splendid donation of \$2,500,000 for the benefit of the poor of London; and in 1866—9, \$3,500,000 for the promotion of education in the southern states. He also endowed the Peabody Museum at Salem, Mass., with \$150,000, and gave to the Washington College, Va., \$60,000; Newburyport, \$30,000 for a library; Phillips' Academy, \$30,000; Andover, \$20,000; Maryland Historical Society, \$20,000; Mass. Historical Society, \$20,000; and Kenyon College, \$25,000, and left property amounting to \$5,000,000 to his relatives. In the trying hours of American credit, Mr Peabody proved himself a true son of America, and struggled manfully to sustain the honour of his native country; and the restoration of confidence in American securities was due more to his efforts than those of any other man. He died in London, Nov. 4, 1869. His remains were temporarily interred in the royal vault in Westminster, and subsequently conveyed in state on board the British ship of war *Monarch*, escorted by an American war steamer, to this country.

and deposited with imposing ceremonies at Danvers (now Peabody), Mass., March, 1870.

PEACE, ARTICLES OF THE, in English Law, are certain complaints made against a person who threatens another with bodily injury, and the redress given is to bind the threatening party over with sureties to keep the peace. All justices of the peace have, by their commission, authority to cause persons to find sufficient security to keep the peace, and an ancient statute also gives authority. Hence any one who is threatened either in person or property, or in the person of his wife or child, may go before a justice of the peace and complain on his oath of the fact. The justice is to consider if the language used amounted to a threat, and if he is satisfied that it does, he issues his warrant to bring the party before him, who is then heard in explanation, and if it is not satisfactory, he is ordered to find sureties. If he cannot do so, he is committed to prison for a limited time, or until the next quarter-sessions. The party, when he finds sureties, is bound over for a term not exceeding twelve months. If he has entered into recognizances (i.e., given a bond with sureties), and he break the peace, he forfeits his recognizance, and the sureties' goods can be seized to pay the amount of the bond.

PEACE, OFFENCES AGAINST THE PUBLIC, are those offences which consist in either actually breaking the peace, or constructively doing so by leading directly to a breach. These offences are now usually known under the heads of unlawful assemblies, seditious libels and slanders, riots, affrays, challenges to fight, forcible entry and detainer, and libel and slander. Those who take part in an unlawful assembly commit a misdemeanour against the public safety. All persons assembled to sow sedition, and bring into contempt the constitution, are in an unlawful assembly. Thus it was held that an attempt to hold a national convention was illegal, for it was impossible to anticipate with certainty the peaceable result of such a meeting. It is, however, somewhat difficult to define precisely what amounts to an illegal assembly, except by saying that it points to some course inconsistent with the orderly administration of the laws. It is the duty of all individual citizens to resist and oppose any unlawful assembly; but the duty rests primarily with the magistrates of the district, who are indictable for breach of duty in not taking active and immediate steps to put down riots. Thus the mayor of Bristol was indicted for not suppressing the riots at the time of the Reform Bill. The magistrates ought to call at once upon special constables to be sworn in, and if these are insufficient, to call for the aid of the military. Seditious libels are also offences against the peace, as inciting directly to a breach. Such are libels vilifying the Sovereign or the Houses of Parliament, or the courts of justice, or even a foreign sovereign, as in the case of Peltier, who was tried for a libel against the Emperor Napoleon I., the tendency of such a libel being to breed misunderstanding between our own sovereign and the foreign sovereign. A riot is the most active form of an offence against the public peace. To constitute a riot, there must be at least three persons engaged together in pursuance of an illegal purpose. Riots often originate in an attempt to redress summarily some private wrong. On such an occasion, before extreme measures are resorted to, and as a test of the good faith of those who are spectators, instead of parties, and by way of full notice to all concerned, the justices of the peace may read the Riot Act, 1 Geo. I. st. 2, c. 5, which commands all persons to disperse within one hour after a proclamation is read, otherwise they will be

guilty of felony. Persons not removing within one hour thereafter may be arrested, and carried before a justice, and committed to prison. It is, however, possible that the justices may make a mistake in thinking that to be an illegal assembly which is not so, for the mere reading of the Riot Act does not alter the character of the assembly, and accordingly if the party arrested prove at the trial that it was no illegal assembly he will be discharged. An affray is also an offence against the public peace, being a public assault, i.e., an assault committed in presence of third parties, for this is apt to lead to further breaches of the peace by others joining in it. Thus prize-fights and duels are affrays, and all present at them are principal offenders, and may be arrested by a constable and bound over to keep the peace, and punished by fine and imprisonment besides. So challenges to fight, provocations to fight, and forcibly entering into a house, are misdemeanours against the public peace.

PEACH (*Amygdalus Persica*), a tree much cultivated in temperate climates for its fruit; a native of Persia and the north of India; of the same genus with the ALMOND (q.v.), and distinguished by oblongo-lanceolate serrulate leaves; solitary flowers, of a delicate pink colour, appearing before the leaves; and the sarcocarp of the drupe succulent and tender, not fibrous as in the almond. This difference in the drupe has been made by some the ground of a generic distinction, but there are intermediate states, so that others have doubted if the P. and almond are even specifically distinct. The NECTARINE differs from the P. only in having a smooth fruit, whilst that of the P. is downy or velvety, and is a mere variety, probably produced and certainly preserved by cultivation. Both peaches and nectarines are divided into *freestones* and *clingstones*. In the former the flesh of the fruit parts from the stone; in the latter it adheres to it. The Freestone P. is the *Pêche* of the French, the Clingstone P. their *Pavie*; the Freestone Nectarine they call *Pêche lisse*, and the Clingstone Nectarine *Brugnon*. Of all these there are many sub-varieties, the finer ones being perpetuated by budding, which in Britain is generally on plum or almond stocks. There is a remarkable variety of Chinese origin, with the fruit compressed and flattened, and with almost evergreen leaves. The P. is much cultivated in the south of Europe, in many parts of the East, in the warmer temperate parts of North and South America, in Australia, &c., as a standard tree; in general, it is rather a small tree with a full head; in Britain, it is generally trained on walls, and in the northern parts of it on fluted walls or in hot-houses, although even in Scotland excellent peaches are ripened on open walls without artificial heat. The Nectarine is rather more tender than the peach. In the extensive P. orchards of New Jersey, Delaware, Maryland, S.W. Michigan, and S. Illinois, which sometimes contain 10,000 or 20,000 trees, the peach is of a superior quality, perhaps unsurpassed in the world. The markets of Philadelphia, New York, and Chicago are thence supplied at a very cheap rate in seasons of abundance. The crop is there less precarious, owing to the ameliorating influence of the neighbouring bays and lakes. See J. A. Fulton, *Peach Culture*. In more southern states, much of the fruit is used for making *Peach Brandy*; or is dried in ovens, or in drying-houses furnished with stoves, or in the sun, each fruit being divided into two parts, and the stone taken out, and when dried sent to market to be used for pies; the refuse of the orchards is used for feeding swine.—The P. is a very pleasant and refreshing fruit, and in a stewed form is useful in slight cases of constipation. The leaves, when fresh, have the smell and taste of bitter almonds; and by bruising them.

mixing the pulp with water, and distilling, the *Peach Water* is obtained which is so much esteemed by many for flavouring articles of cookery. They have been employed as a sedative and as a vermifuge. The seeds almost entirely agree in their properties with bitter almonds; the flowers exhale an odour of bitter almonds; and both seeds and flowers are employed in the manufacture of a liqueur called *Persico*.

PEACH-WOOD, or LIMA-WOOD, a dye-wood imported from South America, supposed to be the produce of a species of *Cæsalpinia*, allied to that which yields the Nicaragua wood. It yields a fine peach colour, whence its name, and is now much used in muslin and calico printing and dyeing.

PEACOCK, or PEA FOWL (*pavo*), a genus of gallinaceous birds of the family *Pavonidae*, or *Phasianidae*, of which only two species are known, natives of the East Indies; birds of large size, and remarkable for magnificence of plumage. The bill is of moderate size, somewhat arched towards the tip; the cheeks nearly naked; the head crested; the tarsi rather long, and armed with a single spur; the wings short; the upper tail-coverts prolonged far beyond the tail, and forming a splendid train—popularly called the *tail*—which is capable of being erected and spread out into a great disk, the true tail being at the same time erected to support it. The Common P. (*P. cristatus*) has for crest a kind of

than the male bird, has no train, and is of dull plumage, mostly brownish, except that the neck is green. As in some other gallinaceous birds, the female has been known, in old age, to assume the plumage of the male. Individuals with white plumage not unfrequently occur, in which even the eye-like spots of the tail are but faintly indicated; and pied peacocks, having the deep blue of the neck and breast contrasted with pure white, are sometimes to be seen. The P. is generally supposed to have been known to the Hebrews in the time of Solomon, but it is not certain that the word commonly translated *peacocks* in the account of Solomon's importations from Tarshish (2d Chron. ix. 21) does not signify *parrots*. It is commonly stated that it first became known to the Greeks on the occasion of Alexander's expedition to India, but Aristophanes mentions it in plays written before Alexander was born. The P. became common among the Greeks and Romans; a sumptuous banquet in the latter days of Roman greatness was scarcely complete without it; and wealth and folly went to the excess of providing dishes of peacocks' tongues and peacocks' brains. Throughout the middle ages, also, a P. was often presented at the tables of the great, on great occasions, the skin with the plumage being placed around the bird after it was cooked. The P. is now common in most parts of the world; generally kept, however, except in warm countries, for ornament rather than for profit, although both the flesh and the eggs are very good. It readily partakes of all the ordinary food provided for the poultry-yard, and is fond of buds and succulent vegetables. It is hardly enough even in cold climates, except that few eggs are laid, and the young are difficult to rear, but the adult birds sit on trees or on the tops of houses, stacks, &c., during the keenest frosty nights, never, if they can avoid it, submitting to the confinement of a roosting-place, like that of the common fowl. Peacocks are found in almost all parts of India, Siam, &c., and the multitudes in which they occur in some districts are wonderful. 'About the passes in the Jungletary district,' Colonel Williamson says, in his *Oriental Field Sports*, 'whole woods were covered with their beautiful plumage, to which a rising sun imparted additional brilliancy. The small patches of plain, among the long grass, most of them cultivated, and with mustard then in bloom, which induced the birds to feed, increased the beauty of the scene; and I speak within bounds when I assert that there could not be less than 1200 or 1500 peafowls, of various sizes, within sight of the spot where I stood for near an hour.' Sir James Emerson Tennent, also, in his work on Ceylon, says that 'in some of the unfrequented portions of the eastern province, to which Europeans rarely resort, and where the peafowl are unmolested by the natives, their number is so extraordinary that, regarded as game, it ceases to be "sport" to destroy them; and their cries at early morning are so tumultuous and incessant as to banish sleep, and amount to an actual inconvenience.'—The harsh cry of the P. seems to have been imitated in its Greek name *Taōs*, and probably has given rise also to the Latin *Pavo* and the English *pea-cock*. The P., in a wild state, always roosts on trees, but makes its nest on the ground. When alarmed, as it feeds on the ground, it cannot readily take wing, and is sometimes run down by dogs or by horsemen.—The other species of P. is the JAPAN P. or JAVANESE P. (*P. Japonensis*, *Javanicus*, or *muticus*), a native of some of the south-eastern parts of Asia and neighbouring islands. It is nearly equal in size to the Common P., but of less brilliant although very similar plumage. The cheeks and around the

Peacock.

cigarette of 24 upright feathers, with slender almost naked shafts and broad tip. The tail consists of 18 brown stiff feathers, and is about six inches long. The train derives much of its beauty from the loose barbs of its feathers, whilst their great number and their unequal length contribute to its gorgeousness, the upper feathers being successively shorter, so that when it is erected into a disk, the eye-like or moon-like spot at the tip of each feather is displayed. The lowest and longest feathers of the train do not terminate in such spots, but in spreading barbs, which encircle the erected disk. The blue of the neck, the green and black of the back and wings; the brown, green, violet, and gold of the tail; the arrangement of the colours, their metallic splendour, and the play of colour in changing lights, render the male P. an object of universal admiration—a sentiment in which the bird himself evidently participates to a degree that is very amusing, as he struts about to display himself to advantage, and labours to attract attention, affording a familiar proverbial image of ostentation and pride. When the disk is erected, the P. has the power of rattling the shafts of its feathers against each other in a very peculiar manner, by a strong muscular vibration. The Peahen is much smaller

eyes are yellow; the neck, and other fore parts, greenish with golden reflections. The crest is longer than that of the Common P., its feathers less equal, and webbed along their whole length.

PEACOCK-STONE, the name under which the dry cartilaginous ligaments of some large lamellibranchiate molluscs, as the pearl oyster, are sold by jewellers. They are used for ornamental purposes, although not so much as formerly; and far more on the continent of Europe, particularly in Portugal, than in Britain. They have opaline reflections, and are therefore sometimes called *Black Opal*.

PEA CRAB (*Pinnotheres*), a genus of brachyurous crustaceans, with nearly circular and not very hard carapace. They are of small size, and interesting from their living within the mantle-lobes of lamellibranchiate molluscs, a circumstance which was well known to the ancients, and gave rise to many curious fables. A species (*P. veterum*) is very common in the *pinna* of the Mediterranean, and was imagined to render important services to its host in return for its lodging, keeping a lookout for approaching dangers, against which the blind *pinna* itself could not guard, and particularly apprising it, that it might close its shell when the cuttle-fish came near. It is curious to find this repeated by Hasselquist, in the middle of last century, as a piece of genuine natural history. Whether the P. C. lives at the expense of the mollusc, and sucks its juices, is uncertain. It is certain that the flesh of such molluscs is palatable to pea crabs, and they eat it greedily in the aquarium. The friendship of the P. C. and the *pinna* is of course as fabulous as that of the lion and jackal, or of the rattlesnake, the owl, and the prairie-dog. A species of P. C. (*P. pisum*) is very common within the mantle-lobes of the Common Mussel on the British coasts. Species are found in almost all parts of the world.

PEA MAGGOT, the caterpillar of a small moth (*Tortrix* or *Grapholitha pisi*), which lays its eggs in young pods of peas. The caterpillar lives in the pods, and eats the peas. This moth is very common in Britain, and in wet seasons the pods of peas are often found very full of its caterpillar.

PE'AN (Old Fr. *pannes*, furs), one of the furs borne in Heraldry, differing from Ermine only in the tinctures: the ground being sable, and the spots of gold.

Pe'an.

PEA ORE, a form of compact brown iron ore (hydrated peroxide of iron), consisting of round smooth grains, from the size of mustard-seed to that of small pease. Sometimes the grains are still smaller and

flattish. This iron ore is very abundant in some places in France, and is smelted.

PEAR (*Pyrus communis*), a tree of the same genus with the Apple (see **PYRUS**), and like it one of the most extensively cultivated and valuable fruit-trees of temperate climates. The leaves are ovate, serrated, smooth on both surfaces, and without glands; the flowers are produced in corymbs, which may almost be called umbels, and are smaller than those of the apple; the styles are distinct and not combined at the base, as in the apple; and the fruit is hemispherical at one end, tapering gradually away, more or less rapidly, to a point at the other. The pear-tree grows wild in woods and copses in Britain, on the continent of Europe, and throughout the temperate parts of Asia. In its

wild state it is usually either a large shrub or a small tree, thorny, and with small austere fruit. In cultivation it is without thorns, becomes a tree of 40 or 50 feet high, sometimes more; and its stem attains a diameter of three feet. Cultivation has wrought even greater changes in the size and quality of its fruit. The pear has been cultivated from remote antiquity. Its cultivation was probably introduced into Britain by the Romans. The cultivated varieties are extremely numerous; and many new ones of great excellence have recently been produced. The *Jargonelle Pear* may be mentioned as one of the most esteemed of the varieties long known in Britain. Some of the kinds called *Bergamot* and *Beurré* are highly esteemed. Many new kinds have been introduced into Britain and America from France and Belgium. The varieties of pear differ much in hardness and in fitness for particular soils; although a deep, moderately strong, dry, loamy soil is the best for this fruit. The finer varieties are cultivated in Britain as wall-trees. Pears succeed well as espaliers. They are generally grafted on seedling stocks of the wild pear, but sometimes on the rowan, and sometimes on the quince. Pears grafted on quince stocks are the best for shallow soils. The flowers and fruit of the pear are mostly produced on spurs, which spring from branches of more than one year old. Various modes of training and pruning are practised for pear-trees. Among the varieties of pears are some which ripen early in autumn, and some which do not ripen till the beginning of winter, and which even require to be mellowed by keeping for a short time; whilst some of the kinds cannot easily be kept for more than a few days. In general, pears cannot be kept so long nor so easily as apples. Pears are sometimes made into a preserve with syrup; and sometimes cut into pieces, and dried in the sun or in an oven, to be afterwards used in pies, a practice very prevalent in France.—A very agreeable fermented liquor called *Perry* is made from pears, in the same manner as Cider from apples; and pear orchards for this purpose are to be seen in some parts of England, especially in Worcestershire and Herefordshire. The varieties of pear cultivated for making perry are all rather austere, and those which yield the best perry are far too austere to be palatable.—The wood of the pear-tree is reddish, very hard, fine-grained, and valuable to turners and joiners. In the northern United States the best varieties of pear are most successfully grown in districts adapted to the vine.

Besides the varieties of pear usually referred to *Pyrus communis*, some are occasionally cultivated which are generally regarded as distinct species. Such are the **AURELIAN PEAR** (*P. salvifolia*), a native of France, with leaves much narrower than the common pear, and a long fruit, which is used for making perry; the **SNOWY PEAR** (*P. nivalis*), a native of the Alps of Austria, with oval obtuse leaves, white and silky beneath, and a globose fruit, which is very acid till it becomes quite ripe, or is beginning to decay, when it is very sweet; the **SAND PEAR** (*P. sinensis*), a native of China and Cochinchina, with heart-shaped, shining, almost evergreen leaves, and apple-shaped warted fruit, very gritty, and fit only for baking, cultivated in gardens in India, but hardy in Britain. For detailed information respecting the adaptation of certain varieties of pears to the various sections and climates of the U. States, the reader is referred to Thomas' *Am. Fruit Culturist*, Fieki's *Pear Culture*, and Quinn's *Pear Culture for Profit*.

PEAR, PRICKLY. See **PRICKLY PEAR**.

PEARL, a peculiar product of certain marine and fresh-water molluscs or shell-fish. Most of the

molluscous animals which are aquatic and reside in shells are provided with a fluid secretion with which they line their shells, and give to the otherwise harsh granular material, of which the shell is formed, a beautifully smooth surface, which prevents any unpleasant friction upon the extremely tender body of the animal. This secretion is evidently laid in extremely thin semi-transparent films, which, in consequence of such an arrangement, have generally a beautiful iridescence, and form in some species a sufficient thickness to be cut into useful and ornamental articles. The material itself in its hardened condition is called *nacre* by zoologists, and by dealers Mother-of-pearl (q. v.). Besides the pearly lining of the shells, detached and generally spherical or rounded portions of the nacre are often found on opening the shells, and there is great reason to suppose these are the result of accidental causes, such as the intrusion of a grain of sand or other substance, which, by irritating the tender body of the animal, obliges it in self-defence to cover the cause of offence, which it has no power to remove; and as the secretion goes on regularly to supply the growth and wear of the shell, the included body constantly gets its share, and thereby continues to increase in size until it becomes a pearl. The Chinese avail themselves of the knowledge of this fact to compel one species of freshwater mussel, *Unio Hyria*, to produce pearls. In order to do this, they keep the Unios in tanks, and insert between the shell and the mantle of the animal either small leaden shot or little spherical pieces of mother-of-pearl. These are sure to receive regular coatings of the nacreous secretion; and after a time look like pearls formed under ordinary circumstances. These curious people also practise another trick upon these animals; they insert small images of the Buddha stamped out of metal, which soon become coated with the pearl-secretion, and are cemented by it to the shells; to those ignorant of its origin, the phenomenon is a supernatural testimony to the truth of Buddhism. Examples of these curiosities are to be found in many of our museums.

A plan of making pearls was suggested to the Swedish government by Linnaeus. It consisted in boring a small hole through the shell of the river mussel, and inserting a grain of sand, so as to afford a nucleus for a pearl. The plan at first succeeded sufficiently well to prove its practicability, and he was rewarded by a sum of money (£450), but it failed as a profitable speculation, and was abandoned.

The exact nature of the secretion has never been satisfactorily determined; it is, however, ascertained that it is deposited in thin films, which overlies each

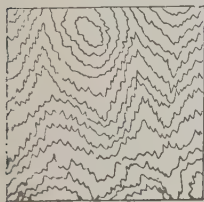

Fig. 1.

other so irregularly, that their sharply serrated edges, when magnified, present the appearance represented in fig. 1; and to this peculiar disposition of the plates, the beautiful iridescence of common pearls is attributed. Their formation was a great puzzle to the ancients, amongst whom they were very highly prized. Dioscorides and Pliny mention the belief that they were drops of dew or rain which fell into the shells when opened by the animal, and were then altered by some power of the animal into pearls. This opinion, which obtained all over the east, is thus charmingly alluded to by Moore:

'And precious the tear as that rain from the sky,
Which turns into pearls as it falls in the sea.'

The most famous pearls are those from the east; the

coast of Ceylon, or Taprobane as it was called by the Greeks, having from the earliest times been the chief locality for pearl fishing. They are, however, obtained now of nearly the same quality in other parts of the world, as Panama in South America, St Margarita in the West Indies, the Coromandel Coast, the shores of the Sooloo Islands, the Bahrein Islands, and the islands of Karrak and Corgo in the Persian Gulf. The pearls of the Bahrein fishery are said to be even finer than those of Ceylon, and they form an important part of the trade of Bassora. These, and indeed all the foreign pearls used in jewellery, are produced by the Pearl Oyster (q. v.). The shells of the molluscs which yield the Ceylon

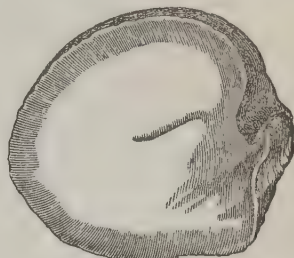

Fig. 2.

Indian, and Persian ones, are sometimes as much as a foot in diameter, and are usually about nine inches. Those of the New World, although the shells are smaller and thicker, are believed to be the same species. The chief locality of the Ceylon pearl fishery is a bank about 20 miles long, 10 or 12 miles from shore, opposite to the villages of Condatchy and Aripo on the northern coast. The season of the fishery lasts about three months, commencing at the beginning of February, and is carried on under government regulations. The boats employed are open, and vary in size from 10 to 15 tons burden; they put out at night, usually at 10 o'clock, on a signal gun being fired from the fort of Aripo, and make for the government guard vessel, which is moored on the bank, and serves the double purpose of a guard and a light-ship. The divers are under the direction of a manager, who is called the Adapanaar, and they are chiefly Tamils and Moors from India. For each diver there is provided a diving-stone, weighing about 30 pounds, which is fastened to the end of a rope long enough to reach the bottom, and having a loop made for the man's foot; and in addition to this, a large network basket, in which to place the pearl oysters as he collects them. These are hung over the sides of the boat; and the diver, placing his foot in the loop attached to the stone, liberates the coils of the rope, and with his net-basket rapidly descends to the bottom. To each boat there is usually allotted a crew of 13 men and 10 divers, 5 of whom are descending whilst the others are resting. This work is done very rapidly; for, notwithstanding the stories to the contrary, the best divers cannot remain longer than 80 seconds below, and few are able to exceed 60. The greatest depth they descend is 13 fathoms, and the usual depth about 9 fathoms. When the diver gives the signal by pulling the rope, he is quickly hauled up with his net and its contents. Accidents rarely happen; and as the men are very superstitious, their safety is attributed to the incantations of their shark-charmers, performed at the commencement of the fishing. Sir E. Tenent, however, attributes the rarity of accidents from sharks, usually so abundant in tropical seas, to the bustle and to the excitement of the waters during

the fishery frightening away those dreaded creatures. The divers are sometimes paid fixed wages, others agree for one-fourth of the produce. When a boat-load of oysters has been obtained, it returns to shore, and the cargo, sometimes amounting to 20,000 or 30,000, is landed and piled on the shore to die and putrefy, in order that the pearls may be easily found. The heaps are formed in small walled compartments, the walls surrounding each being about one or two feet in height. Several of these compartments surround a small central enclosure, in which is a bath, and they slope towards this bath, and are each connected with it by a small channel, so that any pearls washed out from the putrefying mass by the rain may be carried into the bath. When the animals in the shells are sufficiently decomposed, the washing commences, and great care is taken to watch for the loose pearls, which are always by far the most valuable; the shells are then examined, and if any attached pearls are seen, they are handed over to the clippers, who, with pinchers or hammer, skilfully remove them. Such pearls are used only for setting; whilst the former, being usually quite round, are drilled and strung, and can be used for beads, &c. The workmen who are employed to drill the pearls also round the irregular ones, and polish them with great skill. The method of holding the pearls during these operations is very curious; they make a number of holes of small depth in a piece of dry wood, and into these they fit the pearls, so that they are only partly below the surface of the wood, which they then place in water. As it soaks up the water and swells, the pearls become tightly fixed, and are then perforated, &c. These operations are all carried on on the spot.

For many miles along the Condatchy shore, the accumulation of shells is enormous, and averages at least four feet in thickness. This is not to be wondered at, when it is remembered that this fishery has been in active operation for at least 2000 years. The place itself is exceedingly barren and dreary, and, except during the fishing season, is almost deserted; but at that time it presents an exceedingly animated spectacle; thousands of people, of various countries and castes, are here drawn together—some for the fishery, others to buy pearls, and others to feed the multitude. They chiefly reside in tents, so that it appears a vast encampment.

The pearls vary much in size; those as large as a pea, and of good colour and form, are the best, except unusually large specimens, which rarely occur, the most extraordinary one known being the pearl owned by the late Mr Hope, which measured two inches in length, and four in circumference, and weighed 1800 grains. The smaller ones are sorted into sizes, the very smallest being called seed-pearls. A considerable quantity of these last are sent to China, where they are said to be calcined, and used in Chinese pharmacy. Amongst the Romans, the pearl was a great favourite, and enormous prices were paid for fine ones. One author gives the value of a string of pearls at 1,000,000 sesterces, or about £8000 sterling. The single pearl which Cleopatra is said to have dissolved and swallowed was valued at £80,729; and one of the same value was cut into two pieces for earrings for the statue of Venus in the Pantheon at Rome. Coming down to later times, we read of a pearl, in Queen Elizabeth's reign, belonging to Sir Thomas Gresham, which was valued at £15,000, and which he is said to have treated after the fashion of Cleopatra; for he powdered it and drank it in a glass of wine to the health of the Queen, in order to astonish the ambassador of Spain, with whom he had laid a wager that he would give a more costly dinner than could the Spaniard.

During the occupation of Britain by the Romans this country became famous for its pearls, which were found in the freshwater mussel of our rivers. See FRESHWATER MUSSEL. Generally the pearls of this mollusc are small, badly coloured, and often valueless; but occasionally they occur of such beauty as to rival those of the pearl oyster. At present, in the Scotch rivers, the search for pearls is prosecuted vigorously and successfully, especially by a merchant, named Unger, of Edinburgh, who has brought Scotch pearls into great repute. He has collected specimens ranging from £5 to £90 each, and formed a necklace worth £350. In Scotch pearls of the highest quality, there is a pleasing pinkish tint, which is very permanent. The fishing for pearl mussels is by no means so dangerous or troublesome as for pearl oysters; usually they are found in the beds of streams, shallow enough to wade in, and so clear that they can be seen at the bottom. If too deep to remove with the hand, they are easily captured by putting a stick between their gaping shells, which instantly close upon it, and can be drawn out with it. So profitable is this pursuit becoming, that a great many persons are now engaged in it.

Very fine river pearls, known on the continent as Bohemian pearls, are found in the rivers Moldau and Wottawa. There is also a fresh-water pearl fishery in Bavaria, where the river Iltz yields at times very fine specimens. Even the most inferior pearls have a market value; for pearls can only be properly polished with pearl dust, and the inferior pearls are powdered for the purpose of polishing and rounding the finer ones.

False pearls are very admirable imitations, made by blowing very thin beads or bulbs of glass, and pouring into them a mixture of liquid ammonia, and the white matter from the scales of the Bleak, and sometimes of the Roach, and Dace. The proper way to prepare the pearl-matter is first to remove the scales of the lower part of the fish; these must then be very carefully washed, after which they are put to soak in water, when the pearly film falls off and forms a sediment at the bottom of the vessel, which is removed and placed in liquid ammonia for future use. This pearl mixture, when of the best quality, is very costly, being as much as £4 or £5 per ounce. For use, it is diluted with ammonia, and injected into the glass beads, so as to thinly coat them inside; afterwards the better kinds have melted white wax poured in, which renders them much more durable. The French and Germans produce in this way imitations of the finest oriental pearls of such beauty, that the most practised eye can hardly detect the difference. The bleak is procured in considerable quantities for this purpose from the Thames and other rivers in England. See BLEAK.

The invention of artificial pearls is due to a Frenchman, named Jaquin, in the time of Catharine de Medicis, and the manufacture is now chiefly carried on in the department of the Seine, where great improvements have lately been made, especially in the art of giving the irregular forms of large pearls to the glass-bulbs, and thus increasing the resemblance, and in removing the glassy appearance caused by the exterior glass coating, by exposing it for a short period to the action of the vapour of hydrofluoric acid. Mucilage of fine gum-arabic is also used instead of wax, which increases the translucency, gives greater weight, and is not liable to melt with the heat of the wearer's body—a defect to which those filled with wax are very liable.

Roman pearls differ from other artificial pearls, by having the coating of pearly matter on the

outside, to which it is attached by an adhesive substance. The art of making these was derived from the Chinese.

PEARL, a river of Mississippi, U.S., which rises about 100 miles north-north-east of Jackson, and, flowing south through the state, separates it in its lower course from Louisiana, and empties into Mississippi Sound, near the outlet of Lake Pontchartrain. It flows nearly 300 miles through a fertile cotton country, and is navigable to Jackson, the capital.

PEARL ASHES. See **POTASH**.

PEARL BARLEY. See **BARLEY**.

PEARL OYSTER. (*Avicula* or *Meleagrina margaritifera*), a lamellibranchiate mollusc, of the family *Aviculidae*, generally found—great numbers together—attached to submarine rocks at a considerable depth on the coasts of tropical countries, and important as producing almost all the pearls and all the mother-of-pearl of commerce. It is sometimes called the **PEARL MUSSEL**; but the family to which it belongs differs considerably both from that of mussels and from that of oysters, the valves of the shell being unequal, the hinge-line straight and long, and the animal furnished with two adductor muscles, one of them small, and with a foot by which it produces a byssus. The P. O. is of an oblique oval form, longitudinally ribbed, and with concentric foliations when young which disappear when it is old. It attains a large size, and there are several varieties, the most important of which are noticed in the article **MOTHER-OF-PEARL**. The whole inside of the shell is covered with a thick layer of nacre or mother-of-pearl, compact and beautiful, forming indeed the chief part of the shell, and exhibiting very considerable variety of colour, most frequently white, but sometimes blood-red. Pearls are formed of the same substance (see **PEARL**), and are generally, if not always, produced by eggs which have become abortive, and which remain lodged within the mollusc instead of being ejected into the sea.

The P. O. is too rank and coarse to be eaten. When taken from the sea it is commonly laid out in the sun to die, that the pearls may be sought for after the shell opens.

The P. O. is not the only mollusc which produces pearls. The *Placuna placenta*—an oyster (family *Ostreae*) with thin transparent shell, which is used in China and elsewhere as a substitute for window glass—produces diminutive pearls. The Fresh-water Mussel (q. v.) of Britain and America produces pearls sometimes of considerable beauty and value; and instances have occurred of pearls being found in pinnæ, &c., and even in limpets.

PEARL SHELLS. See **MOTHER-OF-PEARL**.

PEARL WHITE. See **WHITE COLOURS**.

PEARSON, JOHN, an English prelate of high celebrity, was born in 1612 at Snoring, in Norfolk, of which place his father was rector, educated at Eton and King's College, Cambridge, where he took the degree of M.A. in 1639, and in the same year took orders, and was collated to a prebend in Salisbury Cathedral. In 1640 he was appointed chaplain to Finch, lord-keeper of the great seal, and on the outbreak of the civil war became chaplain to Lord Goring, and afterwards to Sir Robert Cook, in London. In 1650, he was appointed minister of St Clement's, Eastcheap, London; and in 1659, published the great work by which he is now remembered, *An Exposition of the Creed*. It was dedicated to his flock, to whom the substance of it had been preached some years before in a series of discourses. The laborious learning and the judicial calmness displayed by the author in this treatise have long been acknowledged, and command the

respect even of those who think his elaborate argumentation tedious and not always forcible. It is generally reckoned one of the ablest works produced in the greatest age of English theology—the 17th century. During the same year, P. published *The Golden Remains of the Ever Memorable Mr John Hales of Eton*. At the Restoration, honours and emoluments were lavishly showered upon him. Before the close of 1660 he received the rectory of St Christopher's, in London; was created D.D. at Cambridge; installed Prebendary of Ely and Archdeacon of Surrey; and made Master of Jesus College, Cambridge. In 1661, he obtained the Margaret professorship of Divinity, and was one of the most prominent commissioners in the famous Savoy conference; in 1662, he was made Master of Trinity, Cambridge, and in 1673, was promoted to the bishopric of Chester. The year before he had published his *Vindiciæ Epistolæ S. Ignatii*, in answer to M. Daille, who had denied the genuineness of the epistles. It was imagined for years that P. had triumphed over his opponent. The history of the controversy, however (see **IGNATIUS**), has shewn that Daille was right and P. wrong. In 1684, appeared his *Annales Cyprici*. He died July 16, 1686. P.'s *Opera Posthuma Chronologica* were published by Dodwell (Lond. 1688), and his *Orationes, Conciones et Determinationes Theologicae* contain much valuable matter, for, as Bentley used to say, P.'s 'very dross was gold.' Bishop Burnet thought him 'in all respects the greatest divine of his age.'

PEASANT WAR, in German history, the name given to that great insurrection of the peasantry which broke out in the beginning of the year 1525, and which Zschokke has described as the 'terrible scream of oppressed humanity.' The oppression of the peasants had gradually increased in severity, as the nobility became more extravagant and the clergy more sensual and degenerate. The example of Switzerland encouraged the hope of success, and from 1476 to 1517 there were risings here and there amongst the peasants of the south of Germany. A peasant rebellion, called from its cognizance, the *Bundschuh* (Laced Shoe), took place in the Rhine countries in 1502, and another, called the 'League of Poor Conrad,' in Württemberg, in 1514, both of which were put down without any abatement of the grievances which occasioned them. The Reformation, by the mental awakening which it produced, and the diffusion of sentiments favourable to freedom, must be reckoned amongst the causes of the great insurrection itself; although Luther, Melancthon, and the other leading reformers, whilst urging the nobles to justice and humanity, strongly reprobated the violent proceedings of the peasants. The Anabaptists, however, and in particular Münzer, encouraged and excited them, and a peasant insurrection took place in the Hegau in 1522. Another, known as the 'Latin War,' arose in 1523 in Salzburg, against an unpopular archbishop, but these were quickly suppressed. On January 1, 1525, the peasantry of the abbacy of Kempten, along with the townspeople, suddenly assailed and plundered the convent, compelling the abbot to sign a renunciation of his rights. This proved the signal for a rising of the peasants on all sides throughout the south of Germany. Many of the princes and nobles at first regarded the insurrection with some measure of complacency, because it was directed in the first instance chiefly against the ecclesiastical lords; some, too, because it seemed likely to promote the interests of the exiled Duke of Württemberg, who was then upon the point of reconquering his dominions by the help of Swiss troops; and others,

because it seemed to set bounds to the increase of Austrian power. But the Archduke Ferdinand hastened to raise an army, the troops of the empire being for the most part engaged in the emperor's wars in Italy, and intrusted the command of it to the Truchsess von Waldburg, a man of stern and unscrupulous character, but of ability and energy. Von Waldburg negotiated with the peasants in order to gain time, and defeated and destroyed some large bodies of them, but was himself defeated by them on the 22d of April, when he made a treaty with them, not having, however, the slightest intention of keeping it. Meanwhile the insurrection extended, and became general throughout Germany, and a number of towns took part in it, as Heilbronn, Mühlhausen, Fulda, Frankfurt, &c., but there was a total want of organisation and co-operation. Towards Easter, 1525, there appeared in Upper Swabia a manifesto, which set forth the grievances and demands of the insurgents. They demanded the free election of their parish clergy; the appropriation of the tithes of grain, after competent maintenance of the parish clergy, to the support of the poor and to purposes of general utility; the abolition of serfdom, and of the exclusive hunting and fishing rights of the nobles; the restoration to the community of forests, fields, and meadows, which the secular and ecclesiastical lords had appropriated to themselves; release from arbitrary augmentation and multiplication of services, duties, and rents; the equal administration of justice; and the abolition of some of the most odious exactions of the clergy. The conduct of the insurgents was not, however, in accordance with the moderation of their demands. Their many separate bands destroyed convents and castles, murdered, pillaged, and were guilty of the greatest excesses, which must indeed be regarded as partly in revenge for the cruelty practised against them by Von Waldburg. A number of princes and knights concluded treaties with the peasants conceding their principal demands. The city of Würtzburg joined them, but the Castle of Leibfrauenberg made an obstinate resistance, which gave time to Von Waldburg and their other enemies to collect and strengthen their forces. In May and June 1525, the peasants sustained a number of severe defeats, in which large bodies of them were destroyed. The Landgraf Philip of Hesse was also successful against them in the north of Germany. The peasants, after they had been subjugated, were everywhere treated with terrible cruelty. In one instance a great body of them were perfidiously massacred after they had laid down their arms. Multitudes were hanged in the streets, and many were put to death with the greatest tortures. Weinsberg, Rothenburg, Würtzburg, and other towns which had joined them, suffered the terrible revenge of the victors, and torrents of blood were shed. It is supposed that more than 150,000 persons lost their lives in the Peasant War. Flourishing and populous districts were desolated. The lot of the defeated insurgents became harder than ever, and many burdens of the peasantry originated at this period. The cause of the Reformation also was very injuriously affected. See Sartorius, *Versuch einer Geschichte des Deutschen Bauernkriegs* (Berl. 1795); Ochsle, *Beiträge zur Geschichte des Deutschen Bauernkriegs* (Heilbronn, 1829); Wachsmuth, *Der Deutsche Bauernkrieg* (Leip. 1834); and Zimmermann, *Allgemeine Geschichte des grossen Bauernkriegs* (3 vols., Stuttg. 1841—1843).

PEA-STONE, PISOLITE, or PISIFORM LIMESTONE, is a kind of calcareous spar or limestone, which occurs in globules from one-eighth of an inch to half an inch in diameter, imbedded in a cement of similar substance. There is generally

a grain of sand in the centre of each globule as the nucleus, around which it has been formed, and the concentric plates of its structure are easily visible. Sometimes the nucleus is merely a bubble of air. P. is found in great masses near the hot springs of Carlsbad, in Bohemia. It is sometimes used for ornamental purposes.

PEAT, a substance formed by the decomposition of plants amidst much moisture, as in marshes and morasses; and sometimes described as a kind of *Humus* (q. v.), formed by the accumulation of the remains of mosses and other marsh-plants. The remains of the plants are often so well preserved in it, that the species can be easily distinguished. Reeds, rushes, and other aquatic plants may usually be traced in peat, and stems of heath are often abundant in it; but it chiefly consists, in the northern parts of the world, of different species of *Sphagnum* (q. v.), or Bog-moss. Mosses of this genus grow in very wet situations, and throw out new shoots in their upper parts, whilst their lower parts are decaying and being converted into peat; so that shallow pools are gradually changed into bogs. It was at one time believed that bogs owed their origin to the destruction of forests, the fallen trees impeding the natural drainage, and causing the growth of those marsh-plants of which peat is formed; and this theory was supported by reference to instances supposed to be authenticated by tradition—as that of the moor of Hatfield in Yorkshire, now consisting of about 12,000 acres of peat, and said to have been a forest of firs, till 'the Romans under Ostorius, having slain many Britons, drove the rest into the forest,' which was then destroyed by the victors. There are, however, satisfactory proofs that peat has accumulated in many places around trees; and firs remaining in their natural position have been found to have six or seven feet of peat under their roots, although other trees, as oaks, are commonly found with their stumps resting on the soil beneath the peat. Yet it is not improbable that the destruction of forests may, in some instances, by impeding the course of the streams which flowed through them, have caused the stagnation of water from which the growth of peat resulted. Some of the largest mosses and fens of Europe occupy the place of forests, which were destroyed by order of Severus and other Roman emperors; and some of the British forests, now mosses, as well as some of those of Ireland, were cut because they harboured wolves or outlaws. The overthrow of a forest by a storm in the 17th c., is known to have caused the formation of a *peat-moss* near Loch Broom, in Ross-shire. Layers of trees are not unfrequently found in peat, which seem to have been suddenly deposited in their horizontal position, and sometimes to have been felled by human hands. It is not improbable, however, that sometimes peat has been formed where the soil has been exhausted by the long-continued growth of one kind of tree. The growth of peat is often rapid: bogs have been known to increase two inches in depth in a year. The surface of a bog sometimes becomes a floating mass of long interlaced fibres of plants, known in Ireland as *Old Wives' Tow*. The vegetation on the surface is sometimes very green and compact, like a beautiful turf.

Peat is vegetable matter more or less decomposed, and passes by insensible degrees into Lignite (q. v.). The less perfectly decomposed peat is generally of a brown colour; that which is more perfectly decomposed is often nearly black. Moist peat possesses a decided and powerful antiseptic property, which is attributed to the presence of gallic acid and tannin, and is manifested not only in the perfect preservation of ancient trees and of leaves, fruits, &c., but sometimes even of animal bodies. Thus, in some

instances, human bodies have been found perfectly preserved in peat, after the lapse of centuries.

The formation of peat may be regarded as one of the most important geological changes now in evident progress. It takes place, however, only in the colder parts of the world. In warm regions, the decay of vegetable substances, after life has ceased, is too rapid to permit the formation of peat. The surface covered by peat is very extensive in all the colder parts of the world; although in the southern hemisphere no moss seems to enter into its composition; and the South American peat is said by Mr Darwin to be formed of many plants, but chiefly of *Astelia pumila*, a phanerogamous plant of the rush family. The surface covered by peat even in England is considerable; it is greater in Scotland, and very great in Ireland. Extensive tracts are covered with peat even in the southern countries of Europe, and sometimes even near the sea; and in more northern regions, the *mosses* or *bogs* are still more extensive. For their physical characters, and the mode of reclaiming them, or converting them into arable land, see Bog.

Mere peat is not a good soil, even when sufficiently drained, but, by the application of lime, marl, &c., it is soon converted into good soil, yielding excellent crops. A mixture of peat is often of benefit to soils otherwise poor. And for many shrubs, as rhododendrons, kalmias, whortleberries, &c., no soil is so suitable as one in great part composed of peat; which is therefore in much request with gardeners in order to the formation of the soil for certain kinds of plants.

Peat is extensively used for fuel. The more perfectly decomposed that the vegetable matter is, and the more consolidated that the peat therefore is, the better is it suited for this use. It is the ordinary fuel of great part of Ireland, and is there almost always called *turf*, although the term *turf*, in its ordinary English sense, is utterly inapplicable to it. To procure peat for fuel, the portion of bog to be operated upon must first be partially dried by a wide open drain; its surface is then pared off with the spade, to the depth of about six inches, to remove the coarse undecomposed vegetable matter; the peat is afterwards cut out in pieces (*peats*) like bricks, by means chiefly of a peculiar implement, called in Ireland a *slane*, and in Scotland a *peat-spade*, resembling a long, narrow, sharp spade, the blade of which is furnished on one side with a tongue set at a right angle to it. This implement is used by the hands alone, without pressure of the foot. The soft peats are conveyed to some neighbouring place, where they are set up on end in little clusters to dry. When sufficiently dry, they are conveyed away, and may be piled in outhouses or stacked in the open air. The operation of *peat-cutting* is always performed in spring or summer.—Where peat for fuel cannot be obtained in the way just described, the black mud of a semi-fluid bog is sometimes worked by the feet of a party of men, women, and children until it acquires such a consistency that it can be moulded by the hand. The process is laborious, but the fuel obtained by it is good.—In countries depending on peat for fuel, a very rainy season sometimes occasions great inconvenience, and even distress, by preventing the cutting and drying of the peat.

Peat is a light and bulky kind of fuel, and cannot be conveyed to considerable distances without too great expense. Efforts have, however, been made, both in Scotland and Ireland, to render it more generally useful, and so to promote the reclaiming of bogs, by compressing it until its specific gravity is nearly equal to that of coal. For this purpose, it is first reduced to a pulp. The compressing of peat

has not yet been advantageously prosecuted on an extensive scale.

Attempts have been made in New England to convert peat into a compact dry fuel. Sanguine anticipations were excited as to its great value, but experience has proved that peat cannot be dug, dried, and compressed at a cost that will enable it to compete with anthracite coal. It is estimated that the losses in these fruitless schemes have amounted to almost \$1,000,000.

Peat-charcoal, made from uncompressed peat, is very light and inflammable, and therefore unsuitable for many purposes, but for others it is particularly adapted, and no kind of charcoal excels it in antiseptic and deodorising properties. It is also an excellent manure for many kinds of soil, and great crops have often been obtained by its use. Peat-charcoal is highly esteemed for the smelting of iron, and for working and tempering the finer kinds of cutlery. Charcoal made from compressed peat is in density superior to wood-charcoal, and is capable of being used as coke. The Irish Amelioration Society, some years ago, encouraged the conversion of peat into charcoal, but it seems not to have paid as a commercial speculation, although the resulting charcoal was of good quality. Various companies have been formed for the purpose of obtaining valuable products from the destructive distillation of peat. It appears from researches of Sir R. Kane and others, that 1000 parts of peat yield about 11 of sulphate of ammonia, 7 of acetate of lime, 2 of wood naphtha, 1 of paraffin, 7 of fixed oil, and 3 of volatile oil. The manufacture has not, however, as yet proved sufficiently profitable to be generally adopted, although the distillation of peat has, we believe, been carried on for some years at Athy, near Kildare. For further details on this subject the reader is referred to a parliamentary Report on the Nature and Products of the Destructive Distillation of Peat, published in 1851, and to a paper by Dr Paul in the 6th volume of *The Chemical News*.

PEA WEEVIL or PEA BUG (*Bruchus pisi*), a beetle, which, in the larva state, devours the interior of seeds, leaving little but the hull untouched. It is about one-fifth of an inch long, oval, convex; the head bent downwards, black, variegated with bright brown hairs, and with white spots on the wing-cases.

Pea Beetle (*Bruchus pisi*).
a, natural size.

PEBBLE (probably allied to *bubble*, from the sound of water running among stones), a small, round, water-worn stone of any kind; but with jewellers sometimes an agate—agate being often found as loose pebbles in streams, and those of Scotland in particular being popularly designated *Scotch Pebbles*. Hence the name has come even to be extended to rock-crystal, when not in the crystalline form, and we hear of spectacles with eyes of pebble, &c. Deposits of pebbles (in the sense of water-worn stones), occur among the rocks of all periods, but the pebbles are seldom loose; they are generally cemented together by iron, lime, or siliceous, forming a pudding-stone of greater or less hardness. Single pebbles are sometimes found in deposits which have been formed at a distance from currents in perfectly still water, as in chalk and fine silt. They must have been floated to their places entangled in the roots of trees, or attached to the roots of large buoyant sea-weeds.—BRAZILIAN PEBBLES (so called from Brazil having been long famous for the purity of its rock crystal), are very pure pieces of Rock Crystal (q. v.), used by opticians for making the lenses of spectacles, &c.

PECCARY (*Dicotyles*), a genus of *Pachydermata*, of the family *Suidæ*, much resembling hogs; but having a mere tubercle instead of a tail; only three toes—no external toe—on the hind-feet; the molar teeth and incisors very like those of hogs, but the canine teeth not nearly so long, and not curving

Peccary (*Dicotyles torquatus*).

outwards. An approach to ruminants is seen in the stomach, which is divided into several sacs; also in the union of the metacarpal and metatarsal bones of the two greater toes into a kind of cannon bone. A glandular opening on the loins, near the tail, secretes a fetid humour. Only two species are known, both natives of South America, and except the tapirs, the only existing pachydermata of the American continent.—The COMMON P., COLLARED P., or TAJACU (*D. torquatus*), is found in almost all parts of South America; the WHITE-LIPPED P. (*D. labiatus*) is found in many parts of it. Both are gregarious; the White-lipped P., often assembling in very large herds, and sometimes doing great mischief to maize and other crops. The herds of the White-lipped P. seem to follow a leader, like those of ruminants. The Common P. chiefly frequents forests, and small companies sometimes take up their abode in the hollow of a great tree. The Common P. is about the size of a small hog, grayish; the hairs alternately ringed with black and yellowish white, bristly; and on the neck longer, and forming a mane. A narrow white collar surrounds the neck. The White-lipped P. is considerably larger, of a darker colour, with conspicuously white lips. The ears are almost concealed by the hair. Both species are capable of being tamed, but are of irritable and uncertain temper. In a wild state they defend themselves vigorously against assailants, making good use of their sharp tusks, and a whole herd combine for defence. The hunter has often to take refuge from them in a tree. They are omnivorous; and if hurtful to crops, render service by destroying reptiles. Their voice is somewhat like that of the hog, but more sharp. Their flesh resembles that of the hog, but is said to be inferior. The glands on the loins must be cut out immediately after the P. is killed, or their fetid humour infects the whole flesh. Remains of extinct peccaries are common in the Postpliocene formation of N. America.

PE-CHIH-LE'. See CHIH-LE.

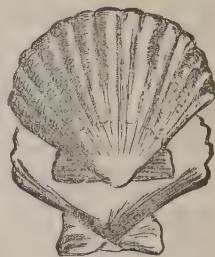

PECK, a measure of capacity for dry goods, such as grain, fruit, &c., used in Britain, and equivalent to 2 imperial gallons, or 554.548 cubic inches. It is thus the fourth part of a Bushel (q. v.). The old Scotch peck, the 16th part of a boll, when of wheat, was slightly less than the imperial peck; but when of barley, was equal to about 1.456 of it.

PECORA (Lat. cattle), a Linnean order of Mammalia, now generally called RUMINANTIA (q. v.).

PECOS, a river of Texas, U.S., rises in the mountains near Santa Fé, New Mexico, runs south-

easterly 600 miles through New Mexico and Texas, and flows into the Rio Grande-del-Norte, in lat. about 29° 20' N., long. 102° W.

PECTEN, a genus of lamellibranchiate molluscs, commonly referred to the same family with the oyster (*Ostrea*), which is sometimes called *Pectinida*. The shell has neither teeth nor laminae in the hinge; the valves are unequal, one of them being often much more convex than the other; the shape is regular; the hinge is extended by *ears*, and in most of the species both valves have ribs radiating from the umbo to the margin. Hence the name *pecten* (Lat. a comb), from the appearance which they present. The animal has a small foot; some of the species are capable of attaching themselves by a byssus; they are capable also of locomotion by opening and rapidly closing the valves, and in this way can even regain the sea from a short distance by leaping on the shore. Some of the larger species are often

Pecten.

popularly called *clams*, a name shared by other bivalves. *P. Jacobæus*, a native of the Mediterranean, is the SCALLOP-SHELL which pilgrims were accustomed to wear in front of their hat, in token of their having visited the shrine of St James at Compostella. It attains a size of about 4 inches long and 5 inches broad. *P. maximus*, found on many parts of the British coasts, is about 6 inches broad. It is sometimes eaten, but is hard and indigestible. Several other species are British. Species are found in almost all parts of the world.

PECTIC ACID AND PECTINE. See FRUITS.

PECTINIBRANCHIATA (Lat. comb-gilled), an order of gasteropodous molluscs, having the gills composed of numerous leaflets or fringes, arranged like the teeth of a comb, and affixed to the internal surface of a cavity which opens with a wide opening above the head. The sexes are distinct. All the P. have two tentacles and two eyes, the eyes often stalked. The mouth is produced into a proboscis, more or less lengthened. The eggs are deposited in a mass, with an envelope often of very remarkable and complicated form, which is produced by coagulation of a viscous albuminous matter secreted by a peculiar gland of the female. The P. are very numerous; the greater number of gasteropods being included in this order; some have a siphon, and some are destitute of it; some have spiral, and some have simply conical shells. Almost all are inhabitants of the sea or its shores; a few are found in fresh water. To this order belong *Whelks*, *Periwinkles*, *Cones*, *Volutes*, *Calyptæ*, &c.

PECTORILOQUY is a term of such frequent occurrence in the history of chest diseases as to require a brief notice in this work. If the stethoscope be applied to the chest of a healthy person, and he be requested to speak, the sounds of his voice will be conveyed to the ear of the observer with very different degrees of clearness, according to the part of the chest on which the base of the instrument rests. If, for example, it be applied at the top of the sternum or breast-bone the voice will reach the ear, through the tube, with tolerable distinctness. For a short distance on either side of the sternum, just below the collar-bones, and in the arm-pits, the voice is still heard, but the sound is indistinct and confused. Below the third rib, and over the remainder of the chest, the voice only

produces an obscure thrilling sound which is known as *pectoral resonance*. In certain morbid conditions the sounds of the voice seem to proceed with distinctness from the walls of the chest directly into the ear; and then, in place of the normal pectoral resonance, we have the physical sign known as *Pectoriloquy* (from the Latin *pectore*, from the chest, and *loquor*, I speak). It occurs when a tolerably superficial excavation, of moderate or considerable size, lies under the stethoscope; and hence it was at one time regarded as an almost certain indication of advanced consumption, but it is now known that it may also occur when solidified masses of lung lie between a large bronchial tube and the part of the chest on which the instrument rests.

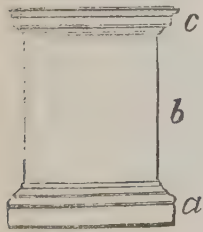

PECULIAR (Fr. *peculier*, i. e., private) is, in English Law, a particular parish or church having jurisdiction within itself, and exempt from the jurisdiction of the ordinary. The Courts of Peculiars in these jurisdictions amount to about 300 in England and Wales, and had jurisdiction in reference to probates of wills before the recent constitution of the Court of Probate. Their jurisdiction is still somewhat obscure.

PEDAL (Lat. *pes*, a foot), any part of a musical instrument acted on by the feet. The pianoforte, the harp, and the organ are furnished with pedals, which, however, serve an entirely different purpose in each instrument. In the pianoforte, their object is to effect a change in the quality or intensity of the sound; the damper pedal prolongs the sound after the finger is lifted from the key, and the shifting or *una corda* pedal softens the tone. The pedals of the harp are the means by which the chromatic changes of intonation are effected. In the organ, the pedals are keys put in action by the feet. The division of the organ which is connected with the foot-keys is called the pedal-organ, and contains the largest pipes. The introduction of pedals in the organ is assigned to a German of the name of Bernhard, who flourished in the 15th c.; they were long of being brought into use in England, but now few organs, except those of the smallest dimensions, are made without them. Pedals are also used in the organ to act on the swell and on the stops. See **ORGAN**.

PEDALIA'CEÆ. See **BIGNONIACEÆ**.

PEDAL-POINT, or **PEDAL HARMONY**. See **ORGAN-POINT**.

PEDEE, GREAT, a river of North and South Carolina, U.S., rises in the Alleghany Mountains, in the north-west of North Carolina, and running south by east flows through the east portion of South Carolina, and enters the Atlantic through Winyaw Bay at Georgetown. It is navigable to Cheraw, 150 miles, and is about 350 miles in length. —The **LITTLE PEDEE**, its principal eastern branch, is formed by the confluence of several smaller rivers in the south part of North Carolina.

Pedestal.

PEDESTAL, a base or block on which columns, statues, &c., are frequently set. The pedestal is much used in classic architecture. Like the column, it has a base, *a*, and a sort of capital or cornice, called the surbase, *c*. The shaft, or plain block, *b*, is

called the dado or die, *b*.

PEDETES, or **HE'LAMYS**, a genus of rodent quadrupeds of the family *Muridae*, allied to

Jerboas, but differing from them in some of the characters of their dentition. The hind-legs, although very long, are not so long as in the *jerboas*. The tail is long. The **JUMPING HARE** (*P.* or *H. Cupensis*) of South Africa is about the size of a rabbit. It can jump 20 or 30 feet at a bound. Its fore-feet also are very strong, and it burrows very expeditiously. The claws are long and strong. The habits of the animal are nocturnal, and it does considerable mischief in corn-fields and gardens.

PEDICELLAR'Æ are very remarkable minute appendages of the integuments of many of the Echinodermata, having the form of a stalk, with a small two-bladed or three-bladed forceps at its summit. They are of a fleshy substance, with calcareous granules imbedded, and in a living state the blades are continually opening and closing. They were at one time supposed to be parasitic zoophytes, but are now generally believed to be organs of the starfish or sea-urchin, although their use is merely conjectured to be that of keeping the surface of the echinoderm free of algæ and zoophytes. The introduction of a pin's point between the blades causes an immediate closing of them. They are found both on shelly and on comparatively soft integuments, and are always present, and always of a particular form, according to the species of echinoderm, and according to the particular place which they occupy, being crowded chiefly around the spines, and near the mouth of sea-urchins.

PEDICULA'RI'S, a genus of herbaceous plants of the natural order *Scrophulariaceæ*, some of which have rather large and finely-coloured flowers. Two species, *P. palustris* and *P. sylvatica*, are natives of Britain, common in wet grounds. Both have received the name of Lousewort, the English equivalent of 'pedicularis,' from their supposed influence in producing the lousy disease in sheep; an influence purely imaginary. Their acidity renders

Pedicularis palustris :

a, corolla cut open, shewing the stamens; *b*, fruit; *c*, pistil.

them injurious to sheep which eat them. *P. pallida*, *canadense*, and *gladiata* are found in low grounds, from N. York to Virginia, and westward. Several species occur in N. Europe and N. Asia. *P. sceptrum*, or King Charles' Sceptre, is one of the principal ornaments of marshy grounds in the most northern countries of Europe.

PEDI'COLUS. See LOUSE.

PEDIGREE (probably from Lat. *pes*, a foot), a tabular view of the members of a particular family with the relations in which they stand to each other, accompanied or unaccompanied by a notice of the chief events in the life of each, with their dates, and the evidence of the facts stated. Pedigrees are indispensable aids to the student of history. The wars of the Roses, the claim of Edward III. to the crown of France, the relative position of Mary and Lady Jane Grey, the circumstances which brought about the union of the crowns of England and Scotland, the Schleswig-Holstein question—now occupying the attention of Europe—and many other familiar chapters in the history of nations, as well as of families, cannot be read aright without the aid of pedigrees. The materials to be used in the formation of a pedigree are notes of the facts to be set forth, and a recognised series of signs and abbreviations. These notes comprise the name of every person who is to appear in the pedigree, with such dates and circumstances as it may be considered desirable to record. Among the commonest abbreviations are *da.*, for daughter of; *s.* and *h.*, son and heir of; *coh.*, coheir of; *w.*, wife of; *s. p.* (*sine prole*), without issue; *v. p.* (*vita patris*), in his father's lifetime; *b.*, born, *d.*, died; *dep.*, deposed; *K.*, king; *E.*, earl, &c. The sign = placed between two names, indicates that they were husband and wife; ∇ indicates that they had children; \downarrow under a name signifies that the person had children. All persons of the same generation are to be kept in the same horizontal line; and the main line of descent is, wherever possible, to be indicated by keeping the successive names in a vertical column. Continuous lines indicate the succession of the different generations. The members of the same family are generally arranged in their order of birth in two groups—the sons first, and then the daughters; but where the same father or mother has children by more than one marriage, the children of each marriage ought to form distinct groups. The actual arrangement, however, of a pedigree must always depend on the leading object which it is intended to illustrate.

Tabular genealogies, generally brief, and meant to illustrate some particular claim of right, are found among the records, public and private, of the early middle ages; but after the incorporation of the English Heralds' College, far more attention was devoted to the compilation of pedigrees of families, more particularly with reference to their claims to dignities and heraldic insignia. In the course of the 16th c., the heralds obtained copies of all such accounts of the English families of any distinction as could be supplied to them, and entered them in the books which contain the records of their official proceedings. Royal commissions were issued under the Great Seal to the two provincial kings-of-arms, empowering them to visit in turn the several counties of England, in order to collect from the principal persons of each county an account of the changes which had taken place in their respective families in the interval since the last preceding visitation, and to inquire what account could be given of themselves by families who had stepped into the rank of gentry, or had become settled in the county since that period. The register-books kept by the heralds and their assistants contain the pedigrees and arms collected in the course of the visitations, with the signatures of the heads of the families. The pedigrees thus collected contain a vast body of information, interesting not only to the professed genealogist, but to every one who would know anything of the distinguished

characters in English history. Some of these books are lost, the rest are scattered among the public and private libraries of the country, the largest collections being in the archives of the College of Arms and the British Museum. After the beginning of last century, the visitations were discontinued, and there has since been no official and regular collection of pedigrees. A standing order of the House of Lords, in 1767, required that before any peer should be allowed to take his seat, Garter-king-of-Arms was to deliver at the table of the House of Lords a pedigree of his family, to be verified by the Committee of Privileges, and eventually preserved in the records of the House, a copy being also registered in the College of Arms. This order was rescinded by Lord Thurlow in 1802, with the view of framing a new one; but, unfortunately, this was never done. Persons sensible of the importance of preserving an authentic account of their descent, frequently record their pedigrees for preservation in the Register of the College of Arms. This register is quite distinct from the heraldic department of that institution, and is open to any one who wishes to preserve evidence of any properly authenticated facts regarding his descent and family.—In Scotland, in the absence of the regular system of visitations which prevailed in England, there is a great deal of evidence regarding the pedigrees of the historical families of the country scattered here and there in public and private collections, including the Advocates' Library and Lyon Office. A register of genealogies, similar to that of the English Heralds' College, exists in the Lyon Office, in which the pedigrees of applicants, after being proved to the satisfaction of the heraldic authorities, are inserted with the accompanying evidence. 'To what extent the register of genealogies in the Lyon Office may be admitted as a probative document, conclusive of the facts which it sets forth, has not been ascertained by actual decision; but there can be no doubt that, in questions both as to property and honours, it would be regarded as a most important adminicle of proof. The genealogical department of the Heralds' College in London is a very important one, and it is to be regretted that the uses of the corresponding department of the Lyon Office are so little understood and appreciated by the public.'—*Lorimer's Handbook of the Law of Scotland*, 2d edit., p. 446.

PEDIGREE, in point of law, is the legal relationship between individuals which is looked to with regard to the descent of property and honours. The occasion in which it comes into question is where a person dies, in which case his property, if he died intestate, is divided among those who are related by blood. The real property goes to one set of relations, and the personal property to others. See **INTESTACY**, **NEXT OF KIN**, **SUCCESSION**, *Paterson's Comp. of English and Scotch Law*, 251, 257.

PEDIMENT, the triangular space over the portico at the ends of the roof of classic buildings. It is enclosed by the horizontal and the *raking* cornices, the latter of which follow the slopes of the roof. The pediment may be called the gable of classic buildings. It is frequently enriched with sculpture, for which it forms a fine setting. The doors and windows of classic buildings are often surmounted by pediments, either straight-sided or curved.

PEDLERS. See **HAWKERS**.

PEDOMETER, an instrument for measuring walking distances. It sometimes has a watch or clock attached. In the patent pedometer of Messrs Payne, William, & Co., there is a repeating watch.

which shews seconds, minutes, and hours, and also the day of the month. They are used by pedestrians, and for measuring streets when the fares of hired carriages are disputed. See ODOMETER.

PEDRO I. (DOM PEDRO D'ALCANTARA), Emperor of Brazil, was the second son of John VI., king of Portugal, and was born at Lisbon, 12th October 1798. On the death of his elder brother in 1801, he became Prince of Beja, and heir to the throne; and after his father's accession to the throne of Portugal and Brazil in 1816, he received the title of Prince of Brazil. He was carried along with the rest of the royal family of Portugal in their flight to Brazil in 1807, and from that time remained in that country. His education, owing to political disturbances, was not carried on systematically, and after his arrival in Brazil, he was left to instruct himself very much according to his own inclination. In 1817, he married the Archduchess Leopoldine of Austria, and on his father's return to Lisbon in 1821, was named Regent of Brazil. At this time, a great political crisis was impending; the Brazilians had been utterly disgusted at the preferment of Portuguese to the highest offices of state and the chief clerical dignities, and their discontent was heightened by the refusal of the Portuguese Cortes to accord to Brazil a liberal constitution similar to that which had been granted to the mother-country, and by its arbitrary command, that P., who was at the head of the liberal party, should at once return to Portugal to complete his education. P., however, cast in his lot with the Brazilians, despite threats of exclusion from the throne of Portugal, and was chosen, on 12th October 1822, Emperor of Brazil. His government was very vigorous, but a war which broke out between his supporters and the advocates of republicanism, distracted the country for a time, and prevented the liberal measures of the government from taking full effect. In 1825, his title was recognised by the Portuguese Cortes; and the death of his father, in the following year, opened for him the succession to the throne of Portugal. This revived the national spirit of the Brazilian Chambers, who feared that they were about to be again reduced to a dependent state, and P.'s hasty and passionate temper led him to measures which whetted the general discontent. But he merely retained the dignity of king of Portugal long enough to shew his right to it, and, after granting a more liberal constitution, immediately resigned in favour of his daughter, Maria II. (q. v.). The disturbances in Brazil still increased, the finances fell into disorder, the emperor's second marriage with the Princess Amelia of Leuchtenberg displeased his subjects; and after making various ineffectual attempts to restore tranquillity, he was compelled, by the revolution of July 1831, to resign the throne in favour of his son, Pedro II., a boy of 5½ years old. P. then sailed for Portugal, where his brother Miguel had usurped the throne; and with the aid of an army which was swelled by French and English volunteers, after a three years' campaign, he drove away the usurper, and restored his daughter to the throne in 1834. But the ceaseless excitement by which he had been surrounded, and the excessive demands on his energies, had produced total exhaustion, and he died 24th September 1834. See BRAZIL; MIGUEL, DOM; and PORTUGAL.

PEDUNCLE. See FLOWER.

PEEBLES. See PEEBLES.

PEEBLESSHIRE, a county in the south of Scotland, also called Tweeddale, from consisting mainly of the upper valley of the Tweed, a river which originates in the county. P. is bounded by

Dumfries and Selkirk shires on the S., Lanarkshire on the W., Mid-Lothian on the N., and Selkirkshire on the E. The county is small, containing only 356 square miles, or 227,869 statute acres. Its lowest point above the mean level of the sea is about 450 feet, from which to 1200 feet is the region of cultivation; but the county being a group of hills, is mostly pastoral, with the arable lands chiefly in the valleys. The highest hill is Broad Law, which reaches an elevation of 2754 feet. Within the county, the Tweed has for tributaries the small rivers Eddleston, Leithen, Quair, Manor, and Lyne, besides many mountain rivulets. P. comprehends sixteen parishes, but several being ecclesiastically united, the number of parish churches, each with a settled minister, is fourteen; the number of parish schools is fifteen. The only town in the county is Peebles, an ancient royal burgh, pleasantly situated on a peninsula formed at the confluence of the Eddleston with the Tweed. The principal villages are Innerleithen, Walker Burn, West Linton, and Carlops. In the year 1871, the population of the county was 12,330, of whom 3172 belonged to Peebles, which, distant 22 miles from Edinburgh, is the seat of a sheriff and county administration. It is also the seat of a presbytery. Besides the parish church, the town has several dissenting places of worship, including an Episcopal and a Roman Catholic chapel. It likewise possesses some good schools, has three branch banks, and a number of inns. As a means of literary and social improvement, Mr W. Chambers, in 1859, made a free gift to this his native town of a spacious suite of buildings, comprising a Reading-room, a Public Library consisting of 15,000 volumes, a Museum, Gallery of Art, and Hall for lectures and concerts—the whole being designated the CHAMBERS' INSTITUTION. Long secluded from general traffic, P. has been lately opened up by railways; and the woollen manufacture has made considerable progress in the parish of Innerleithen. In 1872—1873, the valued rental of the county, town included, exclusive of railway property, was £110,450. Peeblesshire abounds in the remains of British hill-forts, border towers, and other antiquities, and possesses numerous modern mansions of a handsome kind. In the year 1864 there was published a *History of Peeblesshire*, by W. Chambers, 1 vol. 8vo, illustrated with maps and wood engravings; up to that time, the only account of the shire had been a *Description of Tweeddale*, by Dr Alexander Pennecuik, 1715; reissued with notes, 1815. Pop. of P. in 1881, 13,822.

PEEL, a small but populous and thriving seaport town on the west coast of the Isle of Man. It was formerly called 'Holm,' and was a place of great importance in the island. The herring-fishery, the building of vessels of small tonnage, and the manufacture of nets, are here carried on extensively, and form a source of large profits to the inhabitants. The bay is spacious, and abounds with fish of excellent quality.

At the northern extremity of this bay are several grotesque and romantic caverns. The southern extremity is formed by Peel Island, on which stand the grand old ruins of Peel Castle and St German's Cathedral. The castle was formerly the frequent residence of the Earls of Derby, then Lords of the Isle of Man, and is expressly named in the original grant of Henry IV. to the Stanley family. Beneath the cathedral is a strong subterranean dungeon, where many noble persons were in former days imprisoned, including Thomas, Earl of Warwick, in the time of Richard II., and Elinor Cobham, Duchess of Gloucester, who was sentenced to perpetual imprisonment in it in the year 1440, and who died within its gloomy recesses. In Sir Walter

Scott's *Peveril of the Peak*, constant mention is made of this castle, and indeed it may be said to be the scene of the story. The ruins are yearly visited and admired by thousands of persons from all parts of the United Kingdom. The town of P. is now rapidly extending its boundaries, and bids fair to become a place of considerable commercial importance. Pop. about 4000.

PEEL, SIR ROBERT, a very eminent British statesman, was born, 5th February 1788, near Bury, in Lancashire. His father, Sir Robert Peel (created a baronet in 1800), was a wealthy cotton-spinner, from whom he inherited a great fortune. He was educated at Harrow, and at Christ-Church, Oxford, where he graduated B.A. in 1808—taking a double first-class—and entered the House of Commons in 1809 as member for Cashel, adopting the strong Tory politics of his father. Percival was then prime-minister. P. set quietly about the business-work of the House, feeling his way with that steady prudence and persevering diligence that were the conspicuous features of his character. In 1811, he was appointed Under-secretary for the Colonies; and from 1812 to 1818, he held the office of Secretary for Ireland. In this capacity, he displayed a strong anti-Catholic spirit (whence the witty Irish gave him the nickname of 'Orange-Peel'), and was in consequence so fiercely, or, shall we say, ferociously attacked by O'Connell, that even the cool and cautious Secretary was driven to send the agitator a challenge. The police, however, prevented the duel from taking place. From 1818 till 1822, P. remained out of office, but not out of parliament, where he sat for the university of Oxford. He now began to acquire a reputation as a financier and economist; and in 1819, was appointed chairman of the Bank Committee, and moved the resolutions which led to the resumption of cash-payments. He was still, however, as averse as ever to anything like religious or political reform. No member of the Liverpool-Castlereagh cabinet could have been to appearance more resolute. He even vehemently defended the infamous 'Peterloo Massacre' of 1819. In 1822, he re-entered the ministry as Home Secretary—Canning shortly after becoming Foreign Secretary, on the suicide of Lord Castlereagh. The two worked together pretty well for some time, as P. devoted himself chiefly to financial matters, and especially to the currency; but 'Roman Catholic emancipation' was a question on which Canning was considerably in advance of his brother-secretary; and when the former was called upon by the king, after the resignation of Lord Liverpool, to form a sort of Whig-Tory ministry, P., along with the Duke of Wellington and others, withdrew from office. Yet it is singularly characteristic of this most honest and *compromising* statesman, that even when he seceded (1827), his opinions were veering round to the liberal and generous view of the claims of Roman Catholics; and when the death of Canning, shortly after, led to the formation of the Wellington-Peel government, its great measure—actually introduced by 'Orange-Peel' himself—was the ever-memorable one for the 'relief' of the Roman Catholics (1829). As Home Secretary, he also signalled himself by a re-organisation of the London police force—since popularly called 'Peelers' and 'Bobbies,' their previous sobriquet being 'Charlies'—from King Charles I., who (1640) extended and improved the police system—and by the introduction of several other important measures.

Meanwhile, the university of Oxford had rejected its apostate representative, and chosen in his stead Sir Harry Inglis. But now came on the great question of parliamentary reform, which P. firmly

but temporarily opposed. In 1830, the Wellington-Peel ministry fell, and was succeeded by a Whig ministry under Earl Grey, which, in 1832, carried the Reform Bill. P. (now, by the death of his father, Sir Robert P.), when he saw that reform was inevitable, accepted defeat and its results with great equanimity. He shrank from anything like factious opposition to the measure, and contented himself with presenting as forcibly as he could the political *per-contra*. After it was passed, he became the leader of the 'Conservative' opposition; and, as we have said, accepting reform itself as a *fait accompli* and irreversible, he only sought by keen and vigilant criticism of Whig measures to retard the too rapid strides of liberalism. In 1833, when the first 'reformed' parliament assembled, P. took his seat as member for Tamworth, which he represented till the close of his life. On the retirement of the Melbourne ministry in November, 1834, he accepted the office of prime minister, but could not succeed in giving stability to his administration, and was compelled again to give place to Viscount Melbourne in April, 1835, and resumed his place as leader of the opposition. P.'s conduct in opposition was always eminently patriotic. The Whigs, who were being pressed on the one side by the new Radical party and the Anti-corn Law League, and on the other by O'Connell and the Irish Repealers, gradually lost ground, and being narrowly defeated in 1841, on a motion of want of confidence, dissolved parliament. The general election that ensued was virtually a contest between Free-trade and Protection. Protection won; and when the new parliament met, a vote of no-confidence was carried by a majority of ninety-one. The Conservative party, headed by P., now came into office. The great feature of the new government was the attitude it adopted on the corn-law question. The Whigs, while in office, and even after their expulsion, were bent upon a fixed but moderate duty on foreign corn; the Anti-corn Law League would hear of nothing short of an entire repeal, while Sir Robert was in favour of a modification of the sliding scale of duty which had existed since 1828. He introduced and carried (1842), in spite of strong opposition, a measure based upon this principle. The deficit in the revenue, which had become quite alarming under the Melbourne administration, next engaged his attention, and led him to bring in a bill (1842) for the imposition of an 'income-tax' of 7*d.* in the pound, to be levied for three years. To alleviate the new burden, P. commenced a revision of the general tariff, and either abolished or lowered the duties on several very important articles of commerce, such as drugs, dye-woods, cattle, sheep, pigs, salted meat, butter, eggs, cheese, and lard. He also shewed himself resolute in the repression of the clamorous and anarchic malcontents of Ireland. O'Connell (q. v.) was tried for conspiracy, and though the judgment against him was set aside on appeal to the House of Lords, the influence of the 'agitator' was broken. The first half of 1845 was marked by the allowance to Maynooth being increased and changed into a permanent endowment instead of an annual grant, and by the foundation of the Irish unsectarian colleges, and other important measures. But the potato-rot in Ireland during the autumn, followed by a frightful famine, rendered 'cheap corn' a necessity, if millions were not to starve. Cobden and the League redoubled their exertions. Lord John Russell announced the views of the Whig party on the crisis, and Peel again yielded. He told his ministerial colleagues that the corn-laws were

doomed, and that their repeal was inevitable. Some of them refusing to go along with him, he resigned; but after a few days, was recalled, and resumed office. Lord Stanley (afterwards Earl Derby) seceded, and with Lord George Bentinck, Mr Disraeli, &c., formed a 'no-surrender' Tory party; but the Duke of Wellington, Graham, Aberdeen, Gladstone, and other eminent Conservatives, stood by him, and the measure for the repeal was carried. He was, however, immediately afterwards defeated on an Irish Protection of Life Bill. Not so much upon this account, as because he felt that the course which he had pursued had produced a dissolution of the old ties of party, and that he could not expect for some time to find himself at the head of a strong government. P. retired from office in June 1846, giving place to a Whig administration under Lord John Russell, to which he gave an independent but general support as the leader of a middle party rather Whig than Tory. In the critical times of 1847—1848, he was one of the most important props of the government, whose free-trade principles he had now completely accepted. His ecclesiastical policy had also undergone a remarkable change, and he now frankly supported the Whigs in the efforts to carry an act for the repeal of the Jewish disabilities. He was himself regarded by the working and middle classes generally with much grateful respect. An unexpected catastrophe put an end to his career. On the 28th of June 1850, he had spoken with great eloquence in the debate on Lord Palmerston's Greek policy; but on the following day was thrown from his horse in Hyde Park, and was so much injured, that he died on the evening of the 2d of July.—He left five sons, the eldest of whom, SIR ROBERT PEEL, and the second, FREDERICK, are both members of the House of Commons, and have adopted generally the later or Whig politics of their father.

PEEL-TOWER (*W. pill*, a stake, a fortress; *Lat. pila*, a stake, pillar, structure), the name given to the towers erected on the Scottish borders for defence. They are square, with turrets at the angles, and the door is sometimes at a height from the ground. The lower story is usually vaulted, and formed a stable for horses, cattle, &c. For an account of these old towers, now mostly in ruin, see *History of Peeblesshire*, by W. Chambers, 1864.

PEEPUL, PIPUL, or PIPPUL (*Ficus religiosa*), also known as the SACRED FIG of India, and in Ceylon called the Bo TREE; a species of Fig (q. v.), somewhat resembling the Banyan, but the branches not rooting like those of that tree, and the leaves heart-shaped with long attenuated points. The tree is held sacred by the Hindus, because Vishnu is said to have been born under it. It is generally planted near temples, and religious devotees spend their lives under its shade. It is also held sacred by the Buddhists. It attains a great size and age. A wonderfully aged tree of this species is figured in the article Bo TREE. The P. is often planted near houses, and by the sides of walks, for the sake of its grateful shade. The juice contains caoutchouc, and is used by women as bandoline. Lac insects feed upon this tree, and much lac is obtained from it. The fruit is not much larger than a grape, and although eatable, is not valued.

PEER (*Fr. pair*; *Lat. par*, equal), a general name applied to the titled nobility of Great Britain and Ireland, indicating their equality of rank. The peerage includes the various degrees of Baron, Viscount, Earl, Marquis, and Duke. The peers of England, of Great Britain, of the United Kingdom, and certain representative peers of Scotland and Ireland, together with certain of the bishops and

archbishops, who are called lords spiritual, constitute the House of Lords. The dignity of the peerage is hereditary, but in early times was territorial. Life peerages seem at one time to have been not unknown in England; but in 1856 Sir James Parke, having been created by Her Majesty Baron Wensleydale 'for and during the term of his natural life,' the House of Lords, on the report of a Committee of Privileges, held that he was not entitled to sit and vote in parliament. Ladies may be peeresses in their own right either by creation or by inheritance. The wives of peers are also styled peeresses. Under the articles NOBILITY, PARLIAMENT, DUKE, MARQUIS, EARL, VISCOUNT, and BARON, will be found notices of each order of peers, and of the origin, history, and privileges of the peers as a body.

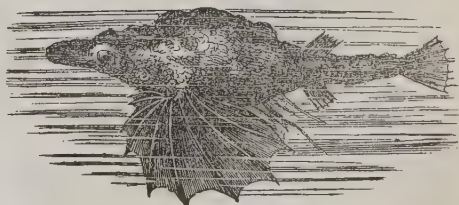

A certain limited number of the French nobility were styled Peers of France.

PEE'WIT. See LAPWING.

PEGASSE, or PACASSE (*Bos pegasus*), a species of ox, a native of the interior of Western Africa. The head is short and thick, the forehead wide; the horns long, extending laterally from the frontal ridge, then turning downwards, and again upwards; the ears very large and pendulous; the neck maned; the tail entirely covered with long hair; the legs long. Little is yet known of this curious species of a most important tribe.

PE'GASUS, in Greek Mythology, a winged horse which arose with Chrysaor from the blood of the Gorgon Medusa, when she was slain by Perseus. He is said to have received his name because he first made his appearance beside the springs (*pēgai*) of Oceanus. He afterwards ascended to heaven, and was believed to carry the thunder and lightning of Zeus. According to later authors, however, he was the horse of Eos. The myth concerning P. is interwoven with that of the victory of Bellerophon over Chimæra. Bellerophon had in vain sought to catch P. for his combat with this monster, but was advised by the seer Polyidos of Corinth to sleep in the temple of Minerva, and the goddess appearing to him in his sleep, gave him a golden bridle and certain instructions, upon which he acted, and made use of P. in his combat with the Chimæra, the Amazons, and the Solymi. P. is also spoken of in modern times as the horse of the Muses, which, however, he was not. The ancient legend on this subject is, that the nine Muses and the nine daughters of Pieros engaged in a competition in singing by Helicon, and everything was motionless to hear their song, save Helicon, which rose ever higher and higher in its delight, when P. put a stop to this with a kick of his hoof, and from the print arose Hippocrene, the inspiring spring of the Muses. But that P. is the horse of the Muses, is entirely a modern idea, being first found in the *Orlando Innamorato* of Boiardo.

PEGASUS, a genus of fishes, constituting the

Sea Dragon (*Pegasus draco*).

family *Pegasiæ*, related to the group *Lophobranchii* (q. v.). The species are few; they are small fishes, natives of the Indian seas, interesting from their peculiar

form and appearance. The breast is greatly expanded, much broader than high, the gill-openings in the sides; the pectoral fins are extremely large and strong; a long snout projects before the eyes, and the mouth is situated under and at the base of it; the body is surrounded by three knobbed or spinous rings. One species (*P. draco*) is called the SEA DRAGON, another (*P. volans*) is popularly known as the PEGASUS.

PEGS. Small square pointed pegs of wood have of late years been introduced by the Americans into the manufacture of boots and shoes, for the purpose of connecting the parts of the sole and upper leather together without sewing. See SHOEMAKING. This invention has been so extensively adopted, that the manufacture of wooden pegs, for this purpose, has become an important trade in America and Bohemia, from which countries a considerable importation is made to Great Britain. They are chiefly made of maple-wood, and are rarely more than an inch in length.

PEGU', a province of British Burmah, lies between the parallels of 15° 14'—19° 27' N. lat., and the meridians of 94° 13'—96° 52' E. long., and is divided for fiscal purposes into the following districts or provinces:

	Area in Square Miles.	Population, 1872.
Rangoon,	9800	373,078
Bassein,	8954	316,833
Myanounng,	4150	444,750
Prome,	2225	257,157
Thayet,	3275	132,604
Total,	28,404	1,524,422

Of this number of inhabitants, about 800,000 are true Burmans; but in addition to these, there is a sprinkling of Karens, who live in the wild and hilly districts, Taleins or Peguers, Shans, Tounghoos, Khyengs, Yabaings, Indians, Chinese, and a few other races.*

The principal river of P. is the Irrawadi (q. v.). In March, the river begins to rise, and gradually increases in volume till its waters are forty feet above their lowest level. They rapidly subside in October, when the rains cease, and the north-east monsoon sets in. The revenue of P. for the year 1862—1863 was 5,653,316 rupees; though, under the rule of the king of Burmah, it did not amount to half that sum. P. was annexed to British India at the close of the Burman war of 1852, since which time slavery has ceased to exist, schools have been established, and various public works undertaken.

Rice and teak timber are the principal exports. A flotilla of steamers keep up the communication between Rangoon (q. v.), the principal port, and the chief stations on the Irrawadi, conveying troops, stores, passengers, and mails from place to place.—Winter's *Six Months in British Burmah* (Lond. 1858); Martin's *British India* (Lond. 1862).

PEHLEVI (Valour, Power; *Zabân Pehlevi* = Language of Heroes) is the name of an ancient West-Iranian (Median and Persian) idiom, in use

* Lieutenant-colonel A. P. Phayre, chief commissioner of British Burmah, in his report for 1863 (Rangoon, 1863) states the population of Pegu as follows:

Races.	
1. Europeans and their descendants,	2,409
2. Burmese, including Aracanese and Talaings,	924,091
3. Karens,	249,518
4. Shans and Tounghoos,	24,689
5. Chinese,	1,724

chiefly during the period of the Sassanides (235—640 A.D.), who, wishing fully to restore the ancient Persian empire, endeavoured also to reinstate the primitive national language, fallen into disuse as a court-language since the time of Alexander's conquest. Yet they did not fix upon the pure Persian as it was still spoken in the interior, but upon the dialect of the western provinces, largely mixed with Semitic words, to which Aryan terminations were affixed. The grammatical structure of the P. presents almost the same poverty of inflections and terminations as the present Persian. Although, however, less rich than Zend (q. v.) in inflection and accentuation, it yet boasts of the same copiousness of words as that dialect, to which it in reality succeeded. It is written from right to left, and the letters are mostly joined. The remnants of P. extant consist of coins, inscriptions (found at Hajiabad, Persepolis, Kirmanshah, &c.), and a number of books, all relating to the religion of Zoroaster. The most important of these are the translation of the chief part of the Zend-Avesta (Yazna, Vispad, and Vendidad), and such original religious works as the Bundeesh, Shikandgumani, Dinkart, Atash Barâm, &c. The P. of the books differs from that of the inscriptions and coins to such a degree—according to the larger or smaller preponderance of the Semitic element—as to have misled investigators (Westergaard and others) to assume that two utterly distinct languages, a purely Iranic and a Semitic one, had been used somewhat indiscriminately at the time. The non-Iranian element is called Huzvareh (Huzooresh) by the Parsee priests, who, taking advantage of the ambiguity of the P. alphabet, often substitute the corresponding Persian for the foreign words. The Iranian part of the P. differs little from the Persian of our own day, and, in fact, the P. changed first into Parsee, and subsequently into modern Persian, simply by getting rid first of its Chaldee, and then of those of its Iranian words which had become obsolete. The chief use of the P. dialect at present is the assistance it offers towards the elucidation of the Zend itself. For the history of its investigation since it was first made known in Europe, we refer to PERSIAN LANGUAGE AND LITERATURE.

PEI-HO', a river of China, which, rising on the confines of Tartary, traverses the northern part of the province of Chih-le (q. v.) or Pe-chih-le, and falls into the Gulf of Pe-chih-le, in about 38° 30' N. lat.

The attack on the escort of the British and French ambassadors, whilst ascending the Pei-ho to Peking (June 1859), led to the war with China of 1860. See CHINA.

PEINE FORTE ET DURE, the 'strong and hard pain;' a species of torture formerly applied by the law of England to those who, on being arraigned for felony, refused to plead, and stood mute, or who peremptorily challenged more than twenty jurors, which was considered a contumacy equivalent to standing mute. In the beginning of the 13th c., this penalty seems to have consisted merely in a severe imprisonment with low diet, persisted in till the contumacy was overcome. But by the reign of Henry IV., it had become the practice to load the offender with weights, and thus press him to death, and till nearly the middle of the 18th c., pressing to death was the regular and lawful mode of punishing persons who stood mute on their arraignment for felony. The motive which induced an accused party, in any case, to submit to this penalty rather than to plead, was probably to escape the attainder which would have resulted from a conviction for felony. During the 15th, 16th, 17th, and even the 18th c., various cases are recorded

of the infliction of the punishment in question. Latterly, a practice prevailed which had no sanction from the law, of first trying the effect of tying the thumbs tightly together with whipcord, that the pain might induce the offender to plead. Among instances of the infliction of the *peine forte et dure*, are the following: Juliana Quick, in 1442, charged with high treason in speaking contemptuously of Henry VI., was pressed to death. Anthony Arrow-smith, in 1593, was pressed to death (Surtees' *History of Durham*, vol. 3, p. 271). Walter Calverly of Calverly, in Yorkshire, arraigned at the York assizes in 1605, for murdering his two children and stabbing his wife, was pressed to death in the castle by a large iron weight placed on his breast (Stow's *Chronicle*). Major Strangways suffered death in a similar way in Newgate in 1657, for refusing to plead when charged with the murder of his brother-in-law, Mr Fussell. In 1720, a person of the name of Phillips was pressed in Newgate for a considerable time, till he was released on his submission; and the same is recorded in the following year of one Nathaniel Hawes, who lay under a weight of 250 lbs. for seven minutes. As late as 1741, a person is said to have been pressed to death at the Cambridge assizes, the tying of his thumbs having been first tried without effect.

The statute 12 Geo. III. c. 20 virtually abolished the *peine forte et dure*, by enacting that any person who shall stand mute when arraigned for felony or piracy shall be convicted, and have the same judgment and execution awarded against him as if he had been convicted by verdict or confession.

PEIPUS, LAKE, in the north-west of Russia, is surrounded by the government of St Petersburg, and the provinces of Esthonia and Livonia. On the south-east it is connected with Lake Pskoff by a strait 16 miles in length and from $1\frac{1}{2}$ to $4\frac{1}{2}$ miles broad. The length of both lakes is 87 miles, the greatest breadth about 40, and the depth from 14 to 49 feet. Lake Pskoff receives the waters of the river Velekaia, and Lake P. is supplied by Lake Pskoff, and by the Embach from the west, and other rivers. The waters of the lower lake are carried to the Gulf of Finland by the Narova. The lakes are studded with several picturesque islands, and surrounded with banks which are for the most part marshy and abound in fish.

PEIRCE, BENJAMIN. See SUPP. in Vol. X.

PEISI'STRATOS (Lat. *Pisistratus*), a famous 'tyrant' of Athens, belonged to a family of Attica, which claimed descent from Pylia Nestor, and was born towards the close of the 7th c. B.C.—certainly not later than 612. His father's name was Hippocrates, and through his mother he was pretty closely related to the great lawgiver, Solon, between whom and P. a very intimate friendship long existed. He received an excellent education; and the charm of his manners, as well as the generosity of his spirit was so great that (according to Solon) had he not been ambitious, he would have been the best of Athenians; but his passion for the exercise of sovereign power led him to adopt a policy of artifice and dissimulation, for the purpose of attaining his ends, which prevents us from regarding him with the admiration that the beneficent character of his government might seem to demand. At first, P. co-operated with his kinsman Solon, and in the war against the Megarians, acquired considerable military distinction; but afterwards, when probably his ambitious views had become more matured, he came forward as the leader of one of the three parties into which Attica was then divided. These were, the *Pedieai* (party of the Plain), or the landed proprietors; the *Parali*

(party of the Seaboard), or wealthy merchant classes; and the *Diactrii* (party of the Highlands), chiefly a labouring population, jealous of the rich, and eager for equality of political privileges. It was to the last of these that P. attached himself; but indeed he assiduously cultivated the good-will of all the poorer citizens, to whom he shewed himself a most liberal benefactor. At last P. took a decided step. Driving into the market-place of Athens one day, and exhibiting certain self-inflicted wounds, he called upon the people to protect him against his and their enemies, alleging that he had been attacked on account of his patriotism. Solon, who was present, accused him of hypocrisy; but the crowd were, according to Plutarch, ready to take up arms for their favourite; and a general assembly of the citizens being summoned, Ariston, one of P.'s partisans, proposed to allow him a body-guard of fifty men. The measure was carried in spite of the strenuous opposition of Solon. Gradually P. increased the number, and in 560 B.C., when he felt himself strong enough, seized the Akropolis. The citizens, in general, seem to have tacitly sanctioned this high-handed act. They were sick of the anarchic broils of the different factions, and probably glad to see their champion and favourite usurp supreme authority. Megakles and the Alkmæonids—the heads of the rich aristocratic party—immediately fled from the city. Solon, who loved neither oligarchic arrogance nor military despotism, but was a thorough constitutionalist, tried, but in vain, to rouse the Athenians against Peisistratos. P., who was not at all vindictive in his disposition, did not attempt to molest Solon; he even maintained the legislation of the latter almost intact, and distinguished himself chiefly by the vigour of his administration. P. himself did not enjoy his first 'tyranny' long. The *Pedieai* and the *Parali* rallied under Lykurgos and Megakles, united their forces, and overthrew the usurper, who was forced to go into exile. But the coalition of the two factions was soon broken up. Megakles hereupon made overtures to P., inviting him to resume his tyranny, which he did, but a family quarrel with Megakles induced the latter to again ally himself with Lykurgos, and P. was driven from Attica. He retired to Eubœa, where he remained for ten years, ever keeping an eye, however, on Athens, and making preparations for a forcible return. How he managed to acquire so much influence while only a banished man, is difficult to ascertain; but certain it is that many Greek cities, particularly Thebes and Argos, placed the greatest confidence in him, and finally supplied him abundantly with money and troops. P. at length sailed from Eubœa, landed in Attica at Marathon, and marched on the capital. His partisans hurried to swell his ranks. At Pallene, he encountered his opponents, and completely defeated them, but used his victory with admirable moderation. When he entered the city, no further resistance was made, and he resumed the sovereignty at once. The date of this event, as of most others in the life of P., is very uncertain; perhaps we shall not err far if we place it about 543 B.C. He lived for sixteen years afterwards in undisturbed possession of power, dying 527 B.C., and transmitting his supremacy to his sons, Hippias and Hipparchus, known as the *Peisistratidæ*. His rule was mild and beneficent. Although the precautionary measures that he adopted to establish his authority involved at first a certain resolute and stringent policy (e.g., the seizure of the children of his leading opponents, and the detaining them as hostages); yet no sooner had he placed himself out of danger, than he began to display that wonderful tact,

moderation, kindness, and sympathetic appreciation of the wishes of the Athenians, that have won him the praise and esteem of all later ages, in spite of his usurpation. He firmly, but not harshly, enforced obedience to the laws of Solon; emptied the city of its poorest citizens, and made them agriculturists, supplying such as had no resources with cattle and seed; secured provision for old and disabled soldiers; bestowed great care on the celebration of the religious festivals of the Atticans, and even introduced some important changes; encouraged literature more than any Athenian had ever done before—it is to P., or to the poets, scholars, and priests about him, that we owe, for example, the first complete edition of Homer (q. v.); and, like his still more brilliant successor in the following century, Perikles, he adorned Athens with many beautiful buildings, such as the Lyceum, a temple to the Pythian Apollo, another to Olympian Zeus, &c.

PEKAN, or WOOD-SHOCK (*Martes Canadensis*), a species of Marten (q. v.), very nearly allied to the sable, a native of the northern parts of North America. It is twice the size of the pine marten, and is generally of a grayish brown colour; the legs, tail, and back of the neck marked with darker brown. The fur, although not so valuable as sable, nor even as that of the pine marten, is useful, and large quantities are sent to the market. The P. lives in burrows, which it excavates in the banks of rivers; and feeds chiefly on fish and other aquatic animals.

PEK'IN, or PE-KING (i.e., Northern Capital), the capital of the Chinese empire since 1408 A.D., is situated in lat. 39° 54' 13" N., and long. 116° 23' 54" E., in the northern province of Chi-li, at a distance of nearly 100 miles from the sea, and about 60 miles from the great Chinese Wall. The population of the city is estimated at about 2,000,000; the entire area, in which is included much vacant space, at 27 square miles, and the circuit of the walls is said to be about 25 miles. These walls are made of earth, with an outer casing of brick, having embrasures for musketry or ordnance every 50 feet; their height is about 40 feet; thickness at the base about 30 feet, and at the top 12 feet, which is paved with stone, and where horsemen can ascend by a ramp or sloping way. At intervals of 60 yards are square towers, projecting outwards from the walls 50 or 60 feet. The gates which give access to the city from the surrounding country are 16 in number, nine of which belong to the Northern or Tartar City, and seven to the Southern or Chinese City. Over each gate is a watch-tower nine stories in height, and loopholed for cannon.

The city of P. is divided into two parts, separated by a wall with three gates. These two sections form respectively the Northern, Interior, or Tartar City, called *Nei-tching*; and the Southern, Exterior, or Chinese City, called *Wai-tching*.*

1 *Nei-tching, or the Northern City*, has three distinct divisions or enclosures—viz., the Prohibited City, the Hwang-Ching, or Imperial City, and the General City. The first of these—the innermost or

central block—is surrounded by a yellow wall about two miles in circumference, which shuts in the palaces, pleasure-grounds, and temples of the sacred city. Here live the emperor and his family, the ladies of the court, and the attendant eunuchs. 'Keën-tsing-Kung,' or 'the Tranquil Palace of Heaven,' the emperor's private palace, is the most magnificent of the royal residences. Other notable buildings of the prohibited city are 'Fung-seen-teen,' the Temple of Imperial Ancestors; Ching-hwang-meau, the Temple of the Guardian Deity of the city; Nan-heun-teen, the Hall of Portraits of the Chinese emperors and sages; and Wan-yuen Ko, the Imperial Library. The Imperial City is built around this central block, and contains the palaces of the princes, temples, some of the government offices, and spacious pleasure-grounds. From Wou-ying-teen, the Imperial Printing-office, the *Imperial*, or *Pe-king Gazette* is issued daily for all government officials throughout the empire. This is the only publication in China approaching to a newspaper, and is named *King Paou*, or 'Great Report.' It is not merely a report for official information, but forms the basis of the national annals, and is compiled from the daily records of the Supreme Council. Besides the daily edition, there is one published every two days, which is sold to the public, and from which are withheld decrees and reports of a secret character. The journal itself is a miserable production even for China, and consists of from 15 to 20 pages, not so large as common note-paper. The General City—the third division or enclosure—lies between the Imperial City and the outside walls; it is more densely populated than either of the preceding divisions, and contains the most important of the public offices, including the six supreme tribunals or boards; the Le-fan-yuen, or the Office of Foreign Affairs; Too-cha-yuen, or the Imperial Censorate, &c.; Han-lin-yuen, or the Grand National College; the Great Medical College; the Observatory; the Police-office; and the British, French, and Austrian legations, which are close to the south wall. The British minister resides in the Leang-kung-foo, or the Palace of Leang, a gorgeous building, consisting of four or five large halls, and covering many acres of land. The principal streets of the general city—from 140 to 200 feet wide and unpaved—are continuous lines of shops painted red, blue, and green, decorated with staring signs and resplendent with Chinese characters highly gilt. By day and by night, by the light of the sun, or by the illumination of torches and paper lanterns, the roar of these great thoroughfares is incessant; shopkeepers, pedlars, mountebanks, quack-doctors, passengers on foot or on horseback, each and all contributing to the general hubbub. The minor streets and lanes, where the houses of the populace are mingled with public offices, temples, stores, and manufactories, are by no means pleasant places, their general characteristics being an 'insupportable odour,' and one-storied brick houses with roofs of a gray colour. There is 'Fetid Hide Street,' 'Dog's-tooth Street,' 'Dog's-tail Street,' 'Barbarian Street,' and many others with names equally uninviting.

2. *Wai-tching, or the Southern City*, is the second great division of Pekin. It measures about four miles from east to west, and two miles, or less, from north to south; but a great portion of the enclosed space is laid out in parks and gardens. Teen-Tan, or the Temple to Heaven, and Tec-Tan, or the Temple to Earth, with their grounds, occupy a considerable space; the theatres and places of public amusement are likewise situated in the Southern or Chinese City. Robert Fortune, who has lately visited P., describes its most peculiar

* Northern City and Southern City are the most correct terms. The latter was added to the more ancient Northern City, and was originally designed to encircle it; hence it was called the Exterior City, in contradistinction to the Northern or Interior City. It was also intended to reserve the Northern City for the Tartars, and the Southern City for the Chinese, as the names still imply; but in point of fact, the Tartar City contains as many Chinese as Tartars; and it is not surrounded by the so-called Chinese City, which latter has only been added on the south side.

and striking features as follows: 'As an eastern city, it is remarkable for its great size, and for its high massive walls, ramparts, and watch-towers. Its straight and wide streets are different from those of any other Chinese town which has come under my observation. Its imperial palaces, summer-houses, and temples, with their quaint roofs and yellow tiles, are very striking objects; and the number of private dwellings situated amongst trees and gardens, surrounded with high walls, give a country or park-like appearance to the great city. The trees and gardens of the palace, with King-shan, or Prospect Hill, are objects of considerable interest, as is also Lama Mosque, suggesting as it does some connection, in times long gone by, with Tibet or India.'

Outside the city, there are unvalled suburbs, as about every walled town in China. These are of considerable extent, but straggling, and consist principally of an agricultural population, the land being everywhere in a state of cultivation, producing chiefly maize and millet, as it is not so suitable for the staple products of rice and wheat. The land is badly watered, but well timbered, which gives a pleasing aspect to the landscape; and when viewed towards the range of mountains extending from the west of P. to the north-east, presents a picturesque panorama. It is in the former direction, towards the north, that the famous *Yuen-ming-yuen* palaces are situated, which were sacked and destroyed by the allies in October 1860. These were 30 in number, surrounded by every variety of hill and dale, woodland and lawn, interspersed with canals, pools, rivulets, and lakes, with numerous temples and pagodas containing statues of men and gods in gold, silver, and bronze. Here had been heaped up for centuries all the movable riches and presents of the emperors of China, amongst which were found many sent by the English embassies. At the approach of the allies, Hien-fung fled in haste; and when Lord Elgin learned that it was in those grounds that the British and French prisoners, captured by treachery, had been tortured, he gave the order to sack and destroy this favourite residence of the emperor's, 'as it could not fail to be a blow to his pride as well as his feelings; and it became a solemn act of retribution.' The palaces were cleared of every valuable, and their walls destroyed by fire and sword; while the fugitive monarch died at his stronghold, Zehol, among the Tartarian Alps.

P. has thus been rendered memorable by this march of the British and French forces (1860) to the walls of the city, on which the British and French flags were raised. The provisions of the treaty of Tien-tsin (1858, see CHINA) were subsequently ratified and supplemented by the *Convention of P.*, which was signed in the English and French languages at P., October 24, 1860. The following is an abstract of this important document. By Article 4, it is agreed that on the day on which this convention is signed, the port of Tien-tsin shall be opened to trade, and British subjects shall reside and trade there under the same conditions as at any other port of China by treaty open to trade. Article 5 confers full liberty on the Chinese to emigrate, together with their families, to British colonies or other foreign parts. Article 6 cedes to Her Majesty the Queen of Great Britain and Ireland, and to her heirs, the township of Cowloon, in the province of Kwangtung, as a dependency of Her Britannic Majesty's colony of Hong-kong, with a view to the maintenance of law and order in and about the harbour of Hong-kong. But the most important article of this Convention is that which allows the residence

of a British envoy at P., a privilege which was alone accorded to Russia. In 1867 Anson Burlingame was appointed in Peking the first ambassador from China to the United States. On July 4, 1868, a treaty was concluded at Washington between the U. States and Chinese Plenipotentiaries, which was received with great satisfaction in America, but was regarded by the English press as a triumph of American over English diplomacy.—See *Yedo and Peking*, by Robert Fortune (London, 1863), *Chinese Repository* (Marco, 1834), *Lord Elgin's Despatches* (October, 1860), Denny's, A. B., and Mayers, W. T., *China and Japan*, a guide to the open ports, &c. (London, 1867), and Courcy, Marquis de, *L'Empire du Milieu*, &c. (Paris, 1867).

PELAGIANISM, the doctrinal system of Pelagius (q. v.), especially on the subjects of the natural condition of man, original sin, grace, free-will, and redemption. Under the head PELAGIUS will be found what may be called the external history of the controversy to which the opinions of that remarkable man gave occasion. The movement, considered in itself, is one of the most interesting in the history of the human mind. At the close of the great controversies on the Trinity and Incarnation, the speculation, which for nearly a century had wearied itself in vain endeavours to make plain the inscrutable mysteries of the divine nature, at length turned inwards upon itself; and no one at all familiar with the controversy on P. can doubt that that prouder view of the capabilities of human nature, which lies at the root of all the theories of which P. was but the exponent, was a reaction against the crude and degrading conceptions of the nature and origin of the soul which characterised the philosophy, not alone of the Manichæan teachers, but of all the dualistic religions which sprung from the prolific soil of Gnosticism. To the Manichæan, and to all in general who adopted the Gnostic views as to the evil origin and nature of matter and material substances, man was, in his *psychical* nature, evil and incapable of good. The Christian teacher, in combating this view, easily passed into an opposite extreme, and overlooking or explaining away the strong language of the Scripture, was led to represent man as endowed with full capacity for all good; and so long as the only adversaries to be controverted were those who urged the views of the Gnostic school, the line taken by Christian writers was but little guarded by any of those limitations and reserves which have arisen in later controversy, and thus the earlier Fathers, especially those of the Eastern Church, where Gnosticism was chiefly to be combated, are found to press earnestly the power for good which man possesses, without entering nicely into the origin or the motive principle of that power. But whatever of vagueness hung over this important subject was dispelled by the bold and precise statements of Pelagius, or at least by the discussion which at once arose thereupon, throughout the entire church. His teaching on the subject of original sin and on the primitive state of man, has been already detailed. See ORIGINAL SIN. The earliest formal embodiment of these doctrines, for the purpose of obtaining upon them the public judgment of the church, was in a number of articles presented to the council of Jerusalem, in 415, by Orosius. See PELAGIUS. Of these, the first five regarded the doctrines already noticed under ORIGINAL SIN. The latter portion of the articles alleged that no grace or aid from God was needed for particular actions, but that free-will and the teaching of the law sufficed; that God's grace is given in proportion to our merits; that free-will would not be free, if it stood in need of aid from God; that the pardon of penitents is not granted according to God's grace and mercy, but according to their own merit and labour;

and that our victory does not come from God's assistance, but from our free-will. Although the final sentence condemnatory of these doctrines (see PELAGIUS) was very generally accepted, yet the recusant party was not wanting in energy and ability. The great champions on each side were Augustine for the orthodox, and Julianus, Bishop of Eclanum, for the Pelagians. Of so much of the controversy as regards original sin, the history has been already related; that on grace and free-will was more subtle, and has led to more numerous divisions on the side of orthodoxy as well as of dissent. In order to evade the condemnation of the doctrine originally ascribed to them as to grace, Pelagius and his followers declared that they did not deny the necessity of grace; but by this name they did not understand any real and internal supernatural aid given by God in each particular action, but only either some general external assistance, such as preaching, the Scriptures, good example, &c., or an aid given which might facilitate and secure the particular work, but which was by no means necessary for its accomplishment. Whether, indeed, they at any time admitted any real internal grace, is a question much disputed. Grace is of two kinds—that which moves the will, and that which enlightens the understanding. It is necessary, too, to distinguish two periods in the history of P.—one before the appearance of the *Epistola Tractoria* of Pope Zosimus; the other, subsequent to that decree. In the first period, it would seem that the Pelagians did not admit the necessity of any internal grace whatever; in the latter, they admitted the necessity of a grace of the intellect, but not of the will; or if they seemed to speak of any internal grace of the will, it was only as facilitating man's act, not as at all necessary to his doing it. The Pelagian theory, in a word, was, that man, as coming from his Creator's hand, possessed in himself, and as constituents of his own nature, all the powers which are necessary for the attainment of salvation; that by the faithful employment of these natural powers, without any further aid whatever from God, he merits eternal life, and all other rewards, by a strict title of justice; and that, to suppose grace to be necessary, is in truth to destroy the essence of free-will. This doctrine was somewhat modified in the Semi-Pelagian System (q. v.). The Catholic schools, all without exception, maintain the necessity of grace for the performance, not only of all meritorious, but of all supernatural good works; and they are equally unanimous in maintaining that the grace so given, even that which is called 'efficacious,' does not destroy the freedom of the will. They distinguish between the 'natural' and the 'supernatural' order, and between the powers and gifts which are proper to the one and to the other. For the attainment of all the ends of the natural order, man possesses, by his very constitution, all the powers and all the gifts which are necessary; and by the proper use of these powers, he is able to merit all the rewards which belong to the natural order. He is able, therefore, without any supernatural grace, to perform morally good works (as acts of natural benevolence, the fulfilment of the ordinary duties to his neighbour, &c.), and to fulfil the purely natural obligations. But in order to work in the supernatural order (such as the love of God above all things for His own sake, faith in Him as the author of all good, &c.), and the rewards which are promised for such works, the will of man must be moved and strengthened by supernatural grace, with which the will freely co-operates, but which is a purely gratuitous gift of God—so purely gratuitous, that although God has promised eternal life as the reward of man's co-operation, yet the merit arises

entirely from God's gift and promise, and not from the natural powers of the human will.

Without going into the details of the teaching of the Catholic schools, it will be enough to particularise the most remarkable among them. Of these, the chief are the Molinist, which, giving most to liberty lies nearest to the border of P., but is clearly distinguished from it by maintaining the necessity of grace for every supernatural act; and the Thomist and Augustinian, which give most to grace, but at the same time expressly preserve the freedom of man's will. The Thomists are often represented as denying the freedom of man's actions under grace; but although it is difficult to explain, in popular language, their method of reconciling both, yet, to those acquainted with the scholastic terminology, their distinction between the infallible efficaciousness of grace, and its imposing necessity on the will, is perfectly appreciable. In this they, as well as the Augustinian school, differ from the Jansenists (q. v.). The Jansenists, indeed, regard the Molinist school as a plain revival of P., and they profess that they alone represent fully, in their own system, the very same position which St Augustine formerly maintained against that heresy in its first origin.

In the Reformed Church, the Arminian doctrine may be said to correspond in the main with the Molinist system in the Roman Church. The Gomarists, in most, although not in all particulars, fall in with the Jansenistic views. The Pelagian views are distinctly represented in modern controversy by the Socinians and Rationalists; and indeed very many of those who, outside of the Roman Church, have at various times engaged in the predestinarian controversy on the side of free-will, have leaned towards, if they have not fully adopted, the Pelagian view. In this controversy, however, the practice, which is not uncommon in polemics, of imputing to an antagonist the extremest views of the particular side to which he leans, has been specially noticeable. The Jesuits have been stigmatised, even by their Catholic antagonists, as Pelagians; the Thomists are called by the Jesuits indiscriminately Jansenists and Calvinists; while both unite in representing Calvin and his school as in substance Manichean.

Hardly one among the many Christian controversies has called forth a greater amount of subtlety and power, and not one has so long and so persistently maintained its vitality. Within the twenty-five years which followed its first appearance, upwards of thirty councils (one of them, the General Council of Ephesus) were held for the purpose of this discussion. It lay at the bottom of all the intellectual activity of the conflicts in the medieval philosophic schools; and there is hardly a single subject which has come into discussion under so many different forms in modern controversy. See JANSEN, ARMINIUS, GRACE, PREDESTINATION, REPROBATION, ORIGINAL SIN, TRAUCUCIANISM.

PELAGIUS, a celebrated heresiarch of the 5th c., author or systematiser of the doctrine known as PELAGIANISM (q. v.). Of his early life, little is known. He was probably born about or before the middle of the 4th c., in Britain, or according to some, in Bretagne, his name being supposed to be a Greek rendering (*Pelagios*, of or belonging to the sea) of the Celtic appellation *Morgan*, or sea-born. He was a monk, but the time and place of his entering that state are unknown; it is certain, however, that he never entered into holy orders. He settled in Rome, and at the end of the 4th c., he had already acquired a considerable reputation for sanctity and for knowledge of the Holy Scriptures and the spiritual life. P. does not appear to have himself been a very active propagandist; but he had

attached to his views a follower of great energy, and a bold and ardent temper, named Celestius, who is generally supposed to have been a Scot, which, in the vocabulary of that age, means a native of Ireland. At Rome, however, they attracted but little notice, although they began to make their doctrine public about 405; and in 410, after the sack of the city by the Goths, they withdrew to Africa. After some time, P. made a pilgrimage to Jerusalem, where he met St Jerome, and for a time enjoyed the regard and confidence of that eminent but hot-tempered scholar. His opinions, however, becoming known, Jerome withdrew from this association. Celestius having remained at Carthage, and sought to be admitted to ordination, his doctrines became the subject of discussion, and in a synod several opinions ascribed to him were condemned. He appealed to Rome, but leaving Carthage without prosecuting the appeal, he passed to Ephesus; and the proceedings taken in Carthage regarding him are chiefly important as having first introduced St Augustine into the controversy. Meanwhile P. remained at Jerusalem, and news of the proceedings at Carthage having been carried to Palestine, P., in 415, was accused of heresy before the synod of Jerusalem, by a Spaniard named Orosius. The impeachment failed, probably from the fact that Orosius was unable to speak Greek, the language of the synod; and in a synod subsequently held at Diospolis in the same year, P. evaded condemnation by accepting the decrees of the synod of Carthage already referred to, and even obtained from the synod an acknowledgment of his orthodoxy. The West, however, was more sharp-sighted or less indulgent. A synod of Carthage, in 416, condemned P. and Celestius, and wrote to Pope Innocent I., requesting his approval of the sentence, with which request Innocent complied by a letter which is still extant. On the death of Innocent, Celestius came to Rome in person, and P. at the same time addressed a letter to Zosimus, the successor of Innocent; and in a council which Zosimus held, Celestius gave such explanations that the pope was led to believe that the doctrines of P. had been misunderstood, and wrote to call the African bishops to Rome. A council of 214 bishops, however, was held in Carthage, in which the doctrines of P. were formally condemned in nine canons, which were sent to Rome with full explanations; and on receipt of these decrees, Zosimus re-opened the cause, cited and condemned Celestius and P., and published a decree, called *Epistola Tractoria*, adopting the canons of the African council, and requiring that all bishops should subscribe them, under pain of deposition. Nineteen Italian bishops refused to accept these canons, and were deposed. Their leader, and the person who may be regarded as the greatest theological advocate of P. in the ancient controversy, was the celebrated Julian, bishop of Eclanum, near Beneventum, who is well known to every reader of his great antagonist, St Augustine. P. himself was banished from Rome, in 418, by the Emperor Honorius. From this date, P. disappears. Of his after-life, nothing is known in detail. Orosius gives an unfavourable account of his later career, but in a period of such excitement, we may not accept implicitly the judgment of an adversary. The controversy, considered as an exercise of intellectual energy, is the most remarkable in the ancient history of the church. But the most important of the writings on the Pelagian side have been lost. Julian is chiefly known through the replies of Augustine. P.'s *Fourteen Books of a Commentary on St Paul's Epistles*, his *Epistle to Demetrius*, and his *Memorial to Pope Innocent*, have escaped destruction probably

from their being included by collectors in the works of St Jerome. They are much mutilated, but yet almost certainly genuine. All his other works have been lost, except some further portions, chiefly fragmentary, which (with the above) have been published under the title of *Appendix Augustiniana*. After his banishment, P. is supposed to have returned to his native country, and to have died there. Others, however, represent him as having died in Palestine. Of his doctrines in detail, an account will be found under PELAGIANISM.

PELARGONIC ACID ($C_9H_{18}O_2$) is one of the volatile fatty acids of the general formula $C_nH_{2n}O_2$. It is an oily fluid, nearly insoluble in water, but soluble in alcohol and ether. It derives its name from its having been originally obtained from the leaves of *Pelargonium roseum* (see next article), by distilling them with water. It may also be obtained by the oxidation of oleic acid or of oil of rue by nitric acid. The pelargonate of ethyl, Pelargonic ether ($C_{11}H_{22}O_2$), is an oily fluid of a very peculiar smell. According to Frankland, it is to this compound that old whisky owes its peculiar flavour; and its addition to new whisky, with a view of giving it an old flavour, is not uncommon.

PELARGONIUM, a genus of plants of the natural order *Geraniaceae*, including many of the most favourite greenhouse flowers, to which the old generic name, *Geranium*, is often popularly given. The characters which distinguish P. from geranium, as now restricted by botanists, are given in the article GERANIUM. The species are numerous, and mostly South African; Australia also producing a few. Some of them are herbaceous, and some are stemless; most of them are half-shrubby. Some have tuberous root-stocks. The leaves exhibit great variety in form, division, &c. The flowers always adhere to a certain type in form, but with great variety in size, colour, &c.; they are always in stalked umbels, which arise from the axils of the leaves, or in the stemless kinds from the midst of the leaves. In no genus has the art of the gardener produced more striking results than in this; and the number of beautiful hybrids and varieties is very great, some of them excelling in beauty any of the original species. Some species, not possessing much beauty of flower, are cultivated for the grateful odour of their leaves, which in some resembles that of roses; in others, that of apples, lemons, &c.; whilst that of many species is rather unpleasant. The cultivation of pelargoniums is similar to that of other *Geraniaceae*. See GERANIUM. A few of the species endure the open air in the south of England; many are planted out in summer even in Scotland. Water must be liberally supplied to pelargoniums during the time of flowering; but no plants more strongly require a period of rest, and water must then be very sparingly given. Many of the shrubby kinds may be taken out of the soil, hung up by the roots in a dry dark cellar, or covered with hay, and put aside in a box, in a cool dry loft or garret, care being taken, however, to protect them from frost. Every leaf should be removed before they are taken up, and young watery shoots should be cut off. Another method of treating them is to cut off every leaf before frost comes, and to keep the plants all winter in their pots in a dry cool room, without giving them a drop of water. By such means, many of this beautiful genus are successfully cultivated by persons who have no greenhouse.

PELASGIANS, variously explained as denoting either 'Swarthy Asiatics' (*Pell-Asici*) or 'Storks' (*Pelargoi*)—significant of wandering habits; or as being derived from the biblical *Peleg* (Gen. x. 26),

from the Greek *Pelagos* (the Sea), *pelazo* (to approach), or *pelein* and *agros* (to till the field), &c.—‘a name, in fact,’ as Niebuhr says, ‘odious to the historian, who hates the spurious philology out of which the pretences to knowledge on the subject of such extinct people arise’—designates a certain tribe or number of tribes who inhabited Italy, Thracia, Macedonia, a part of Asia Minor, and many other regions of Southern Europe, in prehistoric times. Ethnologically, they belong to the same race as the great stock of the earliest known settlers, that reached from the Po and the Arno to the Rhyn-dakus (near Kyzikus). Yet no Pelasgian town or village existing in Greece Proper after 776 B.C., speculation has, ever since the commencement of European historiography, been busy trying to supply the facts that were wanting to ascertain the exact origin and history of these predecessors of the Hellenes and Romans; and so futile have all efforts in this direction remained, that the very term *Pelasgi* has, from the days of Homer to our own, been used almost arbitrarily to designate either a single obscure division of a tribe like the *Leleges* and the *Dolopes*, or as an equivalent for all the Greeks of a very early period. In this latter sense, they are spoken of by *Æschylus*, *Herodotus*, *Homer*; while they are considered one of the branches of the race or races that peopled Greece, by *Thucydides*, *Strabo*, and most modern writers, the word thus not being a comprehensive term, like *Aryan*, but a narrowly circumscribed one, like *Hindu*. Recent investigation seems, as regards their previous history, to lead to the result, that soon after the first immigration of Turanians, they, like other tribes, left their Asiatic homes, and proceeded towards Europe. They are found at a very early period settled in Asia Minor; and *Homer* speaks of them as allies of the *Trojans*. They then seem to have spread themselves, by way of the *Propontis* and *Ægean*, and again by *Crete*, over many of the islands between the two continents; and finally, came to occupy a great part of the Hellenic mainland—*Thessaly*, *Epirus*, the *Peloponnese*, *Attica*, *Macedonia*, *Arcadia*, provinces which, one and all, up to the latest period, bore distinct traces of the once undisputed sway of the *Pelasgians*. According to *Herodotus*, the Hellenes themselves sprang from them; and there can hardly be a doubt that they formed a most important element in the formation as well of that most gifted of nationalities, as of the *Latin people*. The early *Etruscans* (q. v.) were *P.* to a certain extent; and the southern tribes of the *Peucetians*, *Enotrians*, and *Iapygians* are distinctly declared by ancient writers to belong to their race. The step from Greece into Italy is natural enough. What caused their wanderings originally, is difficult to conjecture; but it may not unreasonably be assumed, that they were caused to a certain extent by immigrations of eastern tribes, such as the *Lydians*, *Phrygians*, *Carians*, who pushed them further and further west, as they took possession of their old homes. A special stock was formed by the *Tyrrhenian Pelasgi*, whose gradual advance in Greece may be traced from *Acarnania* to *Boeotia*, thence to *Attica*, and later still, to the *Hellespont*, *Lemnos*, &c. A strong protest, however, must be recorded here on the part of some modern writers against the assumption of others, that the *P.* were in reality the original population of all Italy, as they were of the greatest part of Greece (*Pelasgia*). It is absurd, they argue, to suppose that a rich and populous nation, which had held a country like Italy for many centuries, should suddenly, just at the approach of historical times, die out without leaving even such single remnants as the *Pelasgic* settlements in Greece mentioned by *Herodotus*. These aboriginal Italian *P.* are, according to them, rather

more nor less than a mere hypothesis of ignorant ancient writers, who wished to explain the ethnological and philological affinity between the two classical nations in an easy manner, and who, anticipating the questions about a contemporary colony, kill the whole nation off by pestilence and famine.

The *Pelasgians*, from what we can glean about them, would appear to have been a highly intellectual, receptive, active, and stirring people, of simple habits withal, chiefly intent upon agricultural pursuits. Several improvements in this province were distinctly traced back to them, such as the ploughing with oxen—for which purpose they had to invent the special goad; further, the art of surveying, and the like. Yet they were no less warlike when attacked and driven to self-defence; and the trumpet, which calls the widely scattered troops to the attack, was supposed to have been first used by them. That the art of navigation was well known to them, is shewn sufficiently by their incessant migrations over sea and land. Of their architecture, in that style which, in default of a better name, has been called *Cyclopean* (q. v.), remnants are still existing. The names *Larissa*, *Argos*, *Ephyra*, frequently met in ancient Greece, were bestowed by them upon their fortified cities, and are only generic names, expressive of either mountain fortresses or strongholds in plains. Wishing to remain in peace, they endeavoured to keep off the invader by walls so enormously strong, that it really seems most surprising how they ever could have been taken. Besides these, they built canals, dams, and subterranean water-works of astounding strength and most skilful construction. The accompanying woodcut represents the

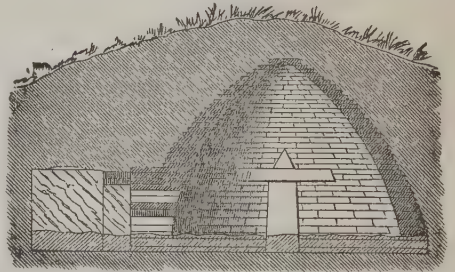

Fig. 1.—Section of Tomb of Atreus at Mycenæ.

tomb or treasury of Atreus at Mycenæ, vaulted with a fine pointed ‘horizontal arch,’ 48½ feet in diameter. Of their sculpture, which they no doubt likewise cultivated to a certain degree, we have but very small relics, such as a head of *Medusa*, and a

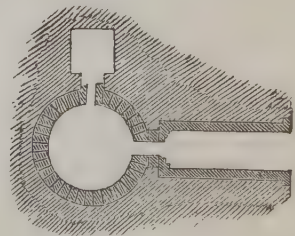

Fig. 2.—Plan of Tomb of Atreus at Mycenæ.

Xoanon (Divine Image) of *Orpheus*; besides these, certain traces of their special mystic worship are to be found in archaic representations,

which, though not hitherto ascribed to them, bear their direct influence upon their very face. How far they were either the inventors of the so-called Cadmean or Phœnician writing-characters, from which all European characters are derived, or merely their 'improvers,' is not to be decided by the contradictory evidence to be found on the subject: but this, at all events, is certain, that they were acquainted with the art of writing, and had thus a vast element of culture in their possession before the dawn of history. Respecting their religion and worship, there is this only to be held with certainty, that it originally consisted in a mystic service of those natural powers, whose influence is chiefly visible in the growth of the fruits of the earth. From Egypt they obtained names for their till then nameless gods, generally called by them the Theoi; and they proceeded—by permission of the Dodonic oracle, which, together with the Pythian, they first founded—to bestow them upon them individually. Their deities were, besides the Phœnician Kabiri, Demeter, Persephone Kora, Dionysos, Hermes, Zeus of Dodona, Apollo, Hephæstus, Themis, Pan, &c. Whether those P. who inhabited Lemnos and Imbros, and who were conquered by Darius, offered up human sacrifices or not, is doubtful. An ambiguous term of Herodotus respecting the language of those small Pelasgian remnants who had survived to his day, has given rise to endless and most unsatisfactory discussions. He speaks (i. 57) of their 'barbarous language;' and the question is, whether he meant that it completely differed from Greek, or that there was only so vast a divergence of dialect, that it had become unintelligible to his contemporaries. Grote inclines to the former opinion; Niebuhr, Thirlwall, T. O. Müller, followed by G. Rawlinson and others, hold, with more apparent show of reason, that the term 'barbarous language' merely indicates a corruption or alteration of idiom, such as a long lapse of time would infallibly produce, and that it bore the same relation to the Greek of the day as the Gothic does to the German, or the Latin to any of the Romance languages, not to instance the forlorn patois of out-of-the-way places in Switzerland and elsewhere, supposed to be inhabited by unmixed descendants from Roman legions. That other phenomenon of the vast number of roots common both to Greek and Latin—the latter, it must be remembered, having been proved to be derived, not from the former, but from the Oscan—would thus easily be explained by the assumption of a common Pelasgian linguistic (as well as ethnical) stock in both nationalities.

Their political circumstances are as unknown to us as the whole process of transition between them and the real Greek period. From a few scattered allusions, we may conclude, that they were not uniformly governed; that some of their multifarious tribes were ruled by priests, while others stood under the patriarchal rule of the head of the clan or family.

How they gradually disappeared from the rank of nations, by being either 'absorbed' by superior races (Hellenes, Italiæ, Carians, Lydians, Phrygians), or being reduced to nameless serf-populations, does not seem so difficult to understand as some writers would have it. Hundreds of nations have disappeared in the same manner, and we may even watch the process with our own eyes. Interesting as it might be to dwell more minutely on some of the widely divergent theories and speculations upon the P. on the part of historians, philologists, ethnologists, antiquaries, and investigators generally, to whom, at all times, this people proved exceedingly attractive, we cannot enter any further upon them

here, but we shall conclude with Grote's dictum: 'If any man is inclined to call the unknown ante-Hellenic period of Greece by the name of Pelasgic, it is open to him to do so. But this is a name carrying with it no assured predicates, noway enlarging our insight into real history, nor enabling us to explain what would be the real historical problem—how, or from whom, the Hellenes acquired that stock of dispositions, aptitudes, arts, &c., with which they begin their career.'

PELAYO, said by historians to have been the first Christian king in Spain, after the conquest of that country by the Arabs. Contemporary historians make no mention of him, but this may be accounted for on the ground of the insignificant size of his kingdom, which comprised only the mountainous district of Asturias. He is said to have been a scion of the royal Visigothic line, and to have retired before the conquering Arabs to the mountains of Asturias, where he maintained himself against the armies which were sent to attack him, defeating them in various pitched battles, and in numberless minor engagements. One of his most famous exploits was the destruction of a large army sent against him by Tarik, near Cangas-de-Onis. His men were posted on the heights bounding the valley through which the Arabs were to pass, and, waiting till the enemy had become involved in the defile, at a given signal, overwhelmed them with enormous masses of rock. This great success caused P. to be recognised as sovereign by the surrounding districts, and the Christians flocked to him from all parts of Spain. He was much engaged in contests with the Arabs, but nevertheless found time to reanimate agriculture, superintend the reconstruction of churches, and the establishment of a civil administration. He died in 737. Such is the account given us by later historians, who trace from him the genealogy of the royal family of Spain.

PELECA'NIDÆ, a family of palmpied birds, the *Totipalmati* of Cuvier; characterised by a long, straight, compressed bill, broad at the base, often with a pouch beneath the lower mandible; long wings, of which the first quill is the longest; short strong legs, and all the toes—including the hind toe—united by a membrane. They are generally excellent swimmers, expert divers, and birds of powerful flight. Some of them often perch on trees, which few other web-footed birds do. To this family belong pelicans, cormorants, frigate-birds, tropic-birds, and darters.

PELEW ISLANDS, a group of islands in the North Pacific Ocean, 450 miles east of the Philippines, in lat. 7°—8° 30' N., long. 134°—136° E., at the western extremity of the Caroline Archipelago. The group includes about 20 islands, which form a chain running about 120 miles from south-south-west to north-north-east. The principal island is Babelthouap, 28 miles by 14, containing a mountain from whose summit a view of the whole group is obtained. As seen from the sea, the islands appear mountainous and rugged; but the soil is rich and fertile, and water is abundant. Bread-fruit, cocoa-nuts, bananas, sugar-cane, lemons, oranges, and other tropical trees and fruits, are grown. Cattle, fowls, and goats thrive, and fish abound on the coasts. The inhabitants, who are estimated at about 10,000 in number, are of the Malay race. They shew considerable ingenuity in building their canoes, are active agriculturists, and entertain exceedingly primitive notions regarding dress, as the men go entirely naked, and the women nearly so. In 1783, the *Antelope* was wrecked upon the P. I., and the crew were treated by the natives with the greatest kindness. Further

acquaintance with white men, however, seems to have altered their disposition, and several vessels, while visiting these islands, within comparatively recent years, have narrowly escaped being cut off. The islands are said to have been discovered by the Spaniards in 1545.

PELICAN (*Pelecanus*), a genus of birds of the family *Pelecanidae* (q. v.), having a very long, large, flattened bill, the upper mandible terminated by a strong hook, which curves over the tip of the lower one; beneath the lower mandible, which is composed of two flexible bony branches meeting at the tip, a great pouch of naked skin is appended; the tongue is very short, and almost rudimentary; the face and throat are naked; the wings of moderate length, the tail rounded. The species are widely distributed, frequenting the shores of the sea, lakes, and rivers, and feeding chiefly on fish. Although birds of powerful wing, they are seldom seen at a great distance from land. All of them are birds of large size. They take their prey by hovering over the water, and plunging upon it when it appears. They often fly in large flocks, and the sudden swoop of a flock of pelicans at a shoal of fish is a striking and beautiful sight. They store up their prey in their pouch, from which they bring it out at leisure, either for their own eating, or to feed their young. The pouch is capable of being wrinkled up into small size, and of being greatly distended.—The **COMMON P.** (*P. onocrotalus*) is as large as a swan, white, slightly tinged with flesh colour, and in old birds,

Pelican (*Pelecanus onocrotalus*).

the breast golden yellow. The quill-feathers are black, but are scarcely seen except when the wings are expanded. It is a native of the eastern parts of Europe, and of many parts of Asia and Africa, and frequents both the sea-coast and also rivers and lakes. It makes a nest of grass on the ground in some retired spot near the water, often on an island, and lays two or three white eggs. The parents are said to carry water to their young, as well as food, in their pouch. During the night, the P. sits with its bill resting on its breast. The nail or hook which terminates the bill is red, and Mr Broderip supposes that the ancient fable of the P. feeding its young with blood from its own breast has originated from its habit of pressing the bill upon the breast, in order the more easily to empty the pouch, when the red tip might be mistaken for blood.—The **RUFous-NECKED P.** (*P. fuscus*) abounds in the West Indies and in many parts of America. Other species are found in other parts of the world, and in some places the number of pelicans is prodigious, particularly in some of the most southern parts of the world.

In Heraldry, the Pelican is drawn with her wings

endorsed, and wounding her breast with her beak. When represented in her nest feeding her young with her blood, she is called a pelican in *her piety*.

Pelican, in Heraldry.

PE'LION, the ancient name of a wooded mountain range in Thessaly, extending along the east coast. Its eastern side descends in steep and rugged precipices to the sea. Further to the north, near the mouth of the Peneus, is the steep conical peak of Ossa (q. v.), which, according to the classic myth, the Titans placed upon the summit of P., in order to scale Olympus, the abode of the gods. The modern name is *Zagorá*, and as of old, its sides and summit are clothed with venerable forests of oak, chestnut, beech, elm, and pine.

PELISSIER, **AIMABLE JEAN JACQUES**, Marshal of France, Duc de Malakhoff, born in 1794 at Maromme, near Rouen. His father was a small farmer, little above the degree of a peasant. P. was first sent to the Lyceum at Brussels. At twenty, he gained admission to the celebrated French artillery college of La Flèche, and was soon transferred to the special school of St Cyr. He entered the artillery of the Royal Guard as sub-lieutenant in 1814, and being transferred to the 57th Regiment of the line, which was not called upon to do duty after the return of Napoleon from Elba, he escaped the dilemma of declaring either for or against the Emperor. He served on the staff in Spain in 1823; made the campaign of the Morea in 1828; joined the first expedition to Algiers in 1830 as major of cavalry; and in 1839 returned to Algeria with the rank of lieutenant-colonel. He commanded the left wing of the French army at the battle of Isly. In 1845, he acquired an unenviable notoriety by suffocating more than 500 Arabs who took refuge in the caves of Ouled-Rijah in the Dahra. Marshal Soult, then Minister of War, did not venture to approve this atrocity, but Marshal Bugeaud, commander-in-chief in Algeria, declared that P. only carried out his positive orders. By 1850, he had attained the rank of General of Division. When the news of the *coup d'état* reached Algiers, he espoused the cause of the emperor, and placed the province of Algiers under martial law until order was restored. In the war with Russia, he obtained in 1855 the command of the first corps of the Crimean army, and soon succeeded Marshal Canrobert in the chief command, when a change came over the fortunes of the campaign. The Russians were defeated on the Tchernaya, and on the 8th September the Malakhoff, the key of Sebastopol, was carried. After the fall of Sebastopol, P. received a marshal's baton, and on his return to France, was created Duc de Malakhoff and a senator, and received a donation of 100,000 francs. He also received the order of a G.C.B. from Queen Victoria. In 1858, he came to London as the French ambassador, but resigned his post, for which he had little relish, in the following year. He was then named Governor-general of Algeria, where he died (May, 1864) of congestion of the lungs.

PE'LLA, the ancient capital of Macedonia, and the birthplace of Alexander the Great, was situated on a hill, and surrounded by marshes. It was a wealthy and powerful city, but declined under the Romans until it became a place of no consequence, and in the middle ages there remained only a strong castle called *Bodena*. Its site has been identified

with that of the village of *Neokhori* or *Yenikuyu*, near which is a spring called *Pelle*.

PELLAGRA, at one time, the name of a loathsome skin-disease, supposed to be endemic to the rice-producing part of the north of Italy, is now employed to designate a group of phenomena, of which the most prominent and significant are mental. Allied affections have recently been described in various continental countries; but as presented in its most intense form in Lombardy, pellagra consists in the skin being covered with tubercles and rough scales, in debility, vertigo, inability to preserve the equilibrium, epilepsy, and great depression of spirits. The melancholia which constituted the latter stage often led to suicide, and so frequently to destruction by drowning, that it was distinguished as a special form of the tendency by the appellation of *Hydromania*. The extent of the ravages of this affection may be estimated from the facts, that of 500 patients in the Milan Lunatic Asylum in 1827, one third were pellagrins; that when Strambio wrote (1784), one of every twenty, and when Holland (1817), one of every five or six of the population presented symptoms of the disease. The belief, so long current, that this malady was the result of the use of rice or maize as the chief article of diet, must now be greatly modified, as it has been observed in districts and under circumstances where the food is of a different description, but where poverty, insufficient nourishment, filth, toil, and the ordinary agents in human degeneration are at work.

PELLET, or **OGRESS**, in English Heraldry, a Roundle (q. v.) sable.

PELLICO, **SILVIO**, an Italian poet, celebrated for his long and cruel imprisonment by the Austrians, more, perhaps, than for his verses, was born in 1788 at Saluzzo, in Piedmont, and was educated in Pignerol, where his father, Onorato Pellico, also favourably known as a lyric poet, had a silk-factory. In his 16th year, he accompanied his sister Rosina (on her marriage) to Lyon, where he remained until Foscolo's *Carne de' Sepolcri* awakened in him a strong patriotic feeling and an irresistible desire to return to Italy. Coming, about 1810, to Milan, where his family were now settled, he was warmly received by Ugo Foscolo and Vincenzo Monti, and was employed as tutor in the family of Count Porro, in whose house all the most distinguished men in Milan were accustomed to meet. His tragedies of *Laodamia* and *Francesca da Rimini* gained him an honourable name amongst Italian poets. He also translated the *Manfred* of Byron, with whom he had become acquainted. He lived in great intimacy with the most eminent patriots and authors of liberal views, and took an active part in a periodical called *Il Conciliatore*, which after a time was suppressed on account of its liberal tone. Having become connected with the secret society of the *Carbonari*, then the dread of the Italian government, P. was apprehended in 1820, and sent to the prison of Sta Margherita, where his friend, the poet Maroncelli, was also confined. In the beginning of the following year, he was carried to Venice, and in January 1822, to the prison on the isle of San Michele, near Venice; and Maroncelli and he were at last condemned to death; but the emperor commuted the sentence to 20 years' imprisonment for Maroncelli, and 15 years for Pellico. In March 1822, they were both conveyed to the subterranean dungeons of the Spielberg. In August 1830, however, they were set at liberty. P. published an account of his sufferings during his ten years' imprisonment, under the title *Le mie Prigioni* (Paris, 1833), which has been translated into other

languages, and has made his name familiar where it would not have been known on account of his poetry. P.'s health, never robust, was permanently injured. The Marchioness of Barolo received him into her house at Turin as her secretary. P. subsequently published numerous tragedies and other poems, and a little catechism on the duties of man. His death took place January 31, 1854.

PELLITORY, or **PELLITORY OF THE WALL** (*Parietaria*), a genus of plants of the natural order *Urticaceae*, having both unisexual and hermaphrodite flowers on the same plant, the perianth of both kinds 4-fid. The COMMON P. (*P. officinalis*), which grows on old walls and heaps of rubbish in Britain and many parts of Europe and Asia, is a herbaceous perennial, with prostrate branched stems, more rarely with erect stems, ovate leaves, and inconspicuous flowers. It sometimes attracts attention from the manner in which the pollen is copiously discharged in hot summer days by an elastic movement of the filaments. It was formerly much esteemed as a diuretic, refrigerant, and lithontriptic. Its properties depend on nitre, which it contains.

Pellitory (*Parietaria officinalis*).

PELLITORY OF SPAIN (*Anacyclus pyrethrum*), a plant of the natural order *Compositae*, of a genus nearly allied to Chamomile (q. v.), a native of the Levant and of Barbary, and cultivated to some extent in Germany and other countries. It has procumbent, branched, downy stems; each branch one-flowered; the root-leaves pinnate, with pinnatifid segments and linear-subulate lobes. The flowers (heads of flowers) have a white ray, purplish beneath, and a yellow disc. The root is spindle-shaped and fleshy, and when dried, is about the thickness of the little finger, inodorous, breaking with a resinous fracture. It has a very peculiar taste, slight at first, but becoming acidulous, saline, and acrid, with a burning and tingling sensation in the mouth and throat, which continues for some time. It is valued in medicine, and is chewed or administered in the form of a tincture to relieve toothache, also in cases of paralysis of the tongue, as a sialogogue in certain kinds of headache, and of rheumatic and neuralgic affections of the face, and is used as a gargle in relaxation of the uvula. The powder of it enters into the composition of certain cephalic snuffs, and is rubbed on the skin in some eastern countries, to promote perspiration. It is the *Radix pyrethri* of the pharmacopoeias. It is a powerful local irritant. The plant cultivated in Germany has more slender roots than that of the Levant, and has sometimes been described as a distinct species (*A. officinarum*), but is probably a mere variety.

PELLS, CLERK OF THE (Lat. *pellis*, a skin), a clerk belonging to the Court of Exchequer in England and Ireland, whose office was to enter every teller's bill into a parchment or skin, called *pellis receptorum*, and also to make another roll of payments, which was called *pellis exitum*, and which shewed the warrant under which the money was paid. The office was abolished in 1834 by the statute 4 and 5 Will. IV. c. 15, which transferred the duties to the comptroller-general, who thereupon assumed the custody of the records; and the Treasury thereafter established new forms of books, accounts, and warrants.

PELOPIDAS, a celebrated Theban general, of noble descent, noted among his fellow-citizens for his disinterested patriotism. The inviolable friendship between himself—one of the richest men in Thebes—and Epaminondas—one of the poorest—is among the most beautiful things recorded in Greek history. In 382 B.C. he was driven from Thebes by the oligarchic party, who were supported by the Spartans, and forced to seek refuge at Athens, whence he returned secretly with a few associates, 379 B.C., and recovered possession of the Kadmeia, or citadel, slaying the Spartan leader, Leontiades, with his own hand. Plutarch gives us a vivid picture of the adventurous exiles gliding quietly in disguise into the city on a winter afternoon, amid bitter wind and sleet. Having been elected Boeotarch, in conjunction with Melon and Charon, he set about training and disciplining his troops, so that they soon became as formidable as the Lacedæmonians, and were successful in several small encounters with the latter. His 'sacred band' of Theban youth largely contributed to the victory of Epaminondas at Leuctra (371 B.C.), but failed in a subsequent attack on Sparta itself. In the expedition of the Thebans against the cruel tyrant, Alexander of Pheræ (368 B.C.), he was, after several important successes, treacherously taken prisoner, when in the character of an ambassador; but was rescued by Epaminondas in the expedition of the following year. He was then sent to Susa, as ambassador from Thebes, to counteract the Spartan and Athenian intrigues going on at the court of Persia, and behaved himself very nobly while there. His diplomacy was successful. In 364 B.C., a third expedition was planned against Alexander of Pheræ, who, as usual, was threatening the Thessalian towns. The command was given to P., and in the summer he marched into Thessaly, where he won the battle of Kynoscephalæ, but was himself killed while too eagerly pursuing the foe. He was buried by the Thessalians with great pomp.

PELOPIUM was the name given, about the beginning of the present century (1802), by Rose to a new metal, which he thought he had discovered in the mineral Columbite. It was subsequently ascertained that it was identical with Niobium.

PELOPONNESIAN WAR. See GREECE.

PELOPONNESUS (i.e., the isle of Pelops), now called the Morea (q.v.), a peninsula, which formed the southern part of ancient Greece, Hellas Proper being situated to the northward of the isthmus, on which stood the city of Corinth. See GREECE. The whole area is less than 9000 square miles. In the most flourishing periods of Grecian history, the P. had a population of more than two millions, although at present it has little over half a million. Among its most important cities were Sparta in Laconia, and Argos the capital of Argolis. Sparta acquired, after the Messenian War, a decided supremacy over the other states, and disputed the supremacy with Athens in a war of almost thirty years' duration (431—404 B.C.)—

the famous 'Peloponnesian War,' of which the history has been written by Thucydides. After the Roman conquest, the P. formed part of the province of Achaia, and subsequently belonged to the Byzantine empire. For its later history, see MOREA.

PELOPS, in Greek Mythology, the grandson of Zeus, and the son of Tantalus, was slain by his father, and served up at an entertainment which he gave to the gods, in order to test their omniscience. They were not deceived, and would not touch the horrible food; but Ceres, being absorbed with grief for the loss of her daughter, ate part of a shoulder without observing. The gods then commanded the members to be thrown into a cauldron, out of which Clotho brought the boy again alive, and the want of the shoulder was supplied by an ivory one. According to the legend most general in later times, P. was a Phrygian, who, being driven by Ilos from Siplyos, came with great treasures to the peninsula, which derived from him the name of Peloponnesus, married Hippodamia, obtained her father's kingdom by conquering him in a chariot race, and became the father of Atreus, Thyestes, and other sons.

PELTRY, a general term applied to the trade in the skins of wild animals, to the undressed skins themselves, and chiefly to furs, the product of North America. The Hudson's Bay Company, which enjoyed an almost complete monopoly of the traffic in furs, ceased to exist in 1859. The fur trade has long been conducted by American companies, associated in the well-known Missouri Fur Company, the Northwest Fur Company, and the enterprises of John Jacob Astor. In 1867, the Russian Fur Company transferred its properties to the United States, and a company was incorporated at San Francisco to take and deal in the furs of the Alaska seal and other animals, and their imports for 1870 are stated at \$2,000,000. London and Leipsic are becoming the best markets for American furs.

The fur now most highly esteemed and the most costly is that of the silver fox, a very rare animal, found only in extreme northern latitudes. It is sold almost exclusively to the nobles of Europe, and 541 skins were sold in 1865; in 1869, 2420 were offered, and in 1870, 910 were sold. The cross-fox is a very beautiful animal, and also rare, the highest number of skins sold being 6291 in 1869, in 1865, 2305, and the sales neither rose above nor fell below these numbers from 1859 to 1870. During the same time, the sales of bear-skins ranged from 7000 to nearly 13,000, and of wolf-skins from 4000 to 12,600. Sales of mink-skins exceeded 100,000 in 1860 and 1869, and during the remaining 11 years ranged from 50,000 to 90,000. Marten-skins, pine, stone, and perhaps the fitch marten, ranged from 78,838 in 1870 to 147,091 in 1859. Muskrat, or musquash, is the most abundant fur-bearing animal, and sales amount to about 2,000,000 a year. The skunk or polecat—now generally called the black marten, or Alaska sable—is very abundant, has been introduced as a fashionable fur, and is really elegant. The sale of skunk-skins in London in 1860 reached 145,679, and in 1864 about 140,000 were sold; in 1865, 78,000; in 1866, 61,000; in 1867, 109,600; in 1868, 70,400; in 1869, 84,300; in 1870, 55,639. Vast numbers are sold in the United States that are not designed for Europe. Of raccoon-skins, half a million are annually sold in London. Of the skins of the beaver, which we had deemed almost extinct, there have been sold during the last 11 years an average number of 150,000 a year, and in 1867, 176,788; in 1870, 165,232. Of lynx-skins (wild-cat), there were sold in 1863—4—5 an average of 5500; in 1868 and 1869, nearly 80,000. Of opossum-skins, there were sold in 1863, 23,065, and in 1867, 214,177. Of buffalo-robcs, in 1856 more

than 100,000 were sold, but in 1864 the sales had dwindled to 60,000, and are now probably much less.

The pelts of many animals in their original state are not well fitted for decorative apparel. The recent discovery, that the long hairs which project over the fine under-fur of many species, are also deeper rooted in the skin, has given rise to an easy and admirable method of removing them very completely. The pelts are stretched and passed through a paring-machine, which pares the flesh-side with such nicety that it takes off a thin layer, and cuts only through the roots of the coarse, deep-seated hairs, which are consequently easily shaken or brushed out. In this way, and by dyeing the fur, beautiful imitations of the costly seal-skins, &c. are prepared from muskrat and other common pelts. See *Appletons' Journal*, Dec. 24, 1870, and Jan. 21, 1871.

PELUSIUM, the Greek name of an ancient Egyptian city, situated at the north-eastern angle of the Delta, and important as the key of Egypt on the Asiatic side. The eastern mouth of the Nile derived from it the epithet Pelusian (*Ostium Pelusiacum*). P. is called *Sin* in the Old Testament; and both words, as well as the native Coptic or Egyptian name *Peremoun*, or *Peromi*, signify the mud-city. The *Ostium Pelusiacum* was choked up with sand as long ago as the 1st c. B.C., and its distance from the sea has ever since been increasing. P. appears to have originally borne the name of Anaris, or Abaris. It is so called by Manetho, who attributes its foundation to the Hyksos about 2000 B.C.; but it first figures in semi-authentic history as the scene of Sennacherib's defeat, when (according to the Egyptian tradition, as reported by Herodotus), the camp of the Assyrians was invaded at night by a host of field-mice, who gnawed their bowstrings and shield-straps, so that in the morning, when the Egyptians fell upon them, they were defenceless. For the Hebrew account of Sennacherib's defeat see 2 Kings, chaps. 18 and 19. In 525 B.C., Cambyses overthrew, near P., the forces of Pharaoh-Psammethichus. The city was also taken by the Persians in 309 B.C.; and in 173 B.C., it was the scene of the defeat of Ptolemy Philometor by Antiochus Epiphanes. Mark Antony captured it, 55 B.C., and it opened its gates to Octavian after his victory at Actium, 31 B.C. Its later history is unimportant, and its ruins—at *Tineh*, near Damietta—possess little interest.

PELVIS, THE (from the Latin *pelvis*, a basin), is a bony ring interposed between the spinal column and the lower extremities, so as to transmit the weight of the former to the latter. Before considering the pelvis as a whole, it will be expedient to consider the individual bones of which it is composed. These, in the adult, are four in number, viz., the two ossa innominata which constitute its sides and front, and the sacrum and coccyx, which complete it behind. The *os innominatum* receives its name from its bearing no resemblance to any known body, and is a large irregular-shaped bone. In the young subject, it consists of three separate bones, which meet and form the deep, cup-shaped cavity (the *acetabulum*), situated a little below the middle of the outside of the bone, and in which the head of the thigh-bone rests. Hence it is usual to describe this bone as consisting of the ilium, the ischium, and the pubes. The *ilium* is the superior, broad, and expanded portion which forms the prominence of the hip, and articulates with the sacrum. This bone may be described as divisible into an external and an internal surface, a crest, and an anterior and posterior border. The external surface (see fig. I.) is convex in front, and concave behind; it is bounded above by the crest,

below by the upper border of the *acetabulum* (see fig. II.), and in front and behind by the anterior and posterior borders. It presents various curved lines and rough surfaces for the attachment of the *glutei* and other powerful muscles connecting the pelvis and the lower extremities. The internal surface, which is smooth and concave, has the same boundaries as the external, except inferiorly, where it terminates in a prominent line, termed the *linea ilio-pectinea*. The surface of the crest is convex, roughened, and sufficiently broad to admit of the attachment of three planes of muscles. The borders will be sufficiently understood by a reference to fig. I. The *ischium* is the inferior and strongest

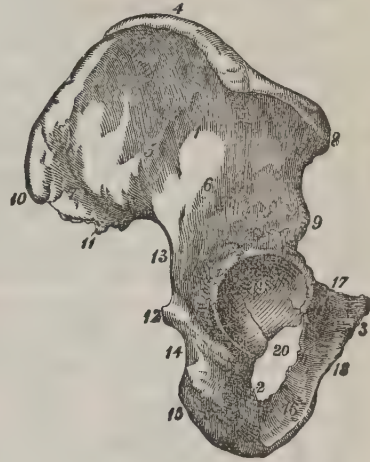

FIG. I.

The Os Innominatum of the right side.

1, the ilium, its external surface; 2, the ischium; 3, the os pubis; 4, the crest of the ilium; 5, 6, upper and lower curved lines for attachment of muscles; 7, the surface for attachment of the *gluteus maximus*; 8, 9, the anterior superior and inferior spinous processes; 10, 11, the posterior spinous processes; 12, the spine of the ischium; 13, 14, the greater and lesser sacro-sciatic notches; 15, the tuberosity of the ischium; 16, its ramus; 17, the body of the os pubis; 18, its ramus; 19, the acetabulum; 20, the thyroid or obturator foramen.—(From Wilson.)

portion of the bone. It consists of a thick and solid portion, the *body* (whose inferior border is termed the *tuberosity*), and a thin ascending portion, the *ramus*. In the ordinary sitting position, the whole weight of the body rests on the ischium; and by sitting on the hands, we can usually feel the part (the *tuberosity*, see fig. I. 15) through which the weight is transmitted. The *pubes* is that portion which runs horizontally inwards from the inner side of the acetabulum for about two inches, and then descends obliquely outwards for about the same length, thus making an acute angle with its original direction. The former part is called the *body*, and the latter the *ramus*, of the pubes. The ramus is continuous with the ramus of the ischium. Between the ischium and pubes is a large aperture, known as the *thyroid* or *obturator foramen*, which in the living body is closed by a membrane termed the *obturator ligament*. The object of this large foramen is probably to give lightness to the parts, without materially diminishing their strength.

The development of the os innominatum affords an excellent example of the general principles laid down in the article *OSSIFICATION*. There are no less than eight centres of ossification for this bone: three primary—one for the ilium, one for the

ischium, and one for the pubes—and five secondary ones for various processes, &c. The first centre appears in the lower part of the ilium, at about the same period that the development of the vertebræ commences, viz., at about the close of the second month of fetal life; the second in the body of the ischium, just below the acetabulum, at about the third month; and the third in the body of the pubes, near the acetabulum, during the fourth or fifth month. At birth, the crest of the ilium, the bottom of the acetabulum, and the rami of the ischium and pubes, are still cartilaginous. At about the sixth or seventh year, these rami become completely ossified; next, the ilium is united to the ischium; and lastly, the pubes is joined to the other two in the acetabulum. The complete ossification of the bone, from the secondary centres in the crest of the ilium, the tuberosity of the ischium, &c., is not completed till about the twenty-fifth year.

Each os innominatum articulates with its fellow of the opposite side (through the intervention of the *interosseous fibro-cartilage*, which unites the two surfaces of the pubic bones, see fig. II. f), with the sacrum, and with the femur (at the acetabulum). No less than thirty-five muscles are attached to this bone, some proceeding to the region of the back, others forming the walls of the abdomen, others forming the floor of the pelvis, others passing downwards to the lower extremities, &c. As the other

heart-shaped in form, and has three principal diameters—an *antero-posterior* (or sacro-pubic), which extends from the angle formed by the sacrum with the last lumbar vertebra to the symphysis pubis, or point of union of the two pubic bones; the *transverse*, at right angles to the former, and extending across the greatest width of the pelvis; and the *oblique*, extending from the sacro-iliac symphysis (or union), on one side, to the margin of the brim corresponding with the acetabulum on the other. The diameters of the outlet are two—an *antero-posterior*, extending from the tip of the coccyx to the lower part of the symphysis pubis; and a *transverse*, from the posterior part of one ischiatic tuberosity, to the same point on the opposite side. As the precise knowledge of the diameter and depth of the pelvis is of the greatest importance in the practice of midwifery, we give the average numbers representing the dimensions of a well-formed adult female pelvis. *Diameters of inlet or brim*—antero-posterior, 4·4 inches; transverse, 5·4 inches; oblique, 4·8 inches. *Diameters of outlet*—antero-posterior, 5 inches; transverse, 4·3 inches. *Depth of the true pelvis*—posteriorly, 4·5 inches; in the middle, 3·5 inches; anteriorly, 1·5 inches.

The pelvis is placed obliquely with regard to the trunk of the body; the plane of the inlet to the true pelvis forming an angle of from 60° to 65° with the horizon. According to Naegele (*Ueber das weibliche Becken*), the extremity of the coccyx is in the female, when standing upright, about seven lines higher than the lower edge of the symphysis pubis; the upper edge of the symphysis being at the same level as the lower edge of the second segment of the coccyx. By attention to these data, a detached pelvis may readily be placed at the angle at which it normally lies in the skeleton. The shape of the human pelvis is much affected by the curving forward of the lower part of the sacrum. This bend of the sacrum forward serves to support the viscera, when the body is in an erect posture; but it is of much more importance in its relation to the act of parturition. If all the antero-posterior diameters of the true pelvis from the brim to the outlet were bisected, the points of bisection would form a curved line, similar to the curve of the sacrum, and termed the *axis* of the pelvis. As the head of the child has to follow this curve, the difficulties of parturition are much greater than if the axis of the pelvis had been straight, as in the other vertebrata. Without entering into unnecessary details, we may remark generally, that the foetal head is of oval shape, with its greatest diameter from before backwards, and that in its passage through the pelvis it is so placed that its longest diameter at each stage of labour coincides with the longest diameter of the pelvis. The head enters the pelvis with the occiput (or back of the skull) being directed towards one ilium, and the face towards the other, while, at its final emergence, the face is turned towards the sacrum and coccyx. There can be no doubt that the screw-like or rotatory motion which is thus given to the foetal head, renders its passage through the pelvis more easy than it would otherwise have been.

There are well-marked differences, chiefly having reference to the act of parturition, between the male and female pelvis. In the female, the bones are lighter and more delicate than in the male, and the muscular impressions and eminences are less distinctly marked. The iliac fossæ are large and expanded, and hence the great prominence of the hips. The several diameters (particularly the transverse diameter of the brim, which measures only 5·1 inches in the male) are somewhat greater; and the

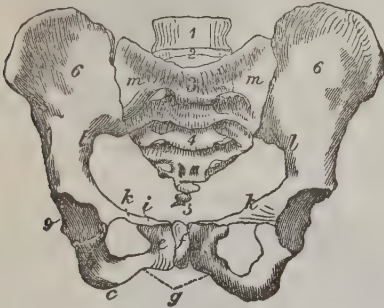

Fig. II.

Pelvis (with Fifth Lumbar Vertebra) of European Female adult. Transverse diameter, 5·7; antero-posterior diameter, 4·5 inches.

- 1, the last lumbar vertebra; 2, the inter-vertebral substance connecting it with the sacrum; 3, the promontory of the sacrum; 4, its anterior surface; 5, the coccyx; 6, 6, the iliac fossæ; 7, the acetabulum; 8, the tuberosity, and 9 the body of the ischium; a, the os pubis; b, the symphysis pubis; c, the arch, d, the spine, and e the pectineal line of the pubis; k, l, k, l, the ileo-pectineal lines.—(From Humphry.)

bones entering into the formation of the pelvis, the sacrum, and the coccyx, belong essentially to the vertebral column, and will be described in the article on that subject, it is sufficient here to remark that, collectively, they form a triangular bony mass (with the base upwards, and with a concave anterior surface), which constitutes the posterior part of the pelvic ring. See fig. II. 4, 5.

The pelvis, considered as a whole, is divisible into a false and true pelvis. The *false pelvis* is all that expanded portion which is bounded laterally by the iliac bones, and lies above the prominent line termed the *linea ileo-pectinea* (see fig. II. k, l); while the *true pelvis* is all that part of the general pelvic cavity which is situated below that line. The broad, shallow cavity of the false pelvis serves to support the weight of the intestines; while the rectum, bladder, and part of the generative organs, lie in the cavity of the true pelvis. The upper aperture of the true pelvis is termed the *inlet*. It is somewhat

pubic arch is wider by about ten degrees; the sacrum also is wider and less curved.

It is worthy of notice that the pelvis of the negro is smaller in all its dimensions than that of the

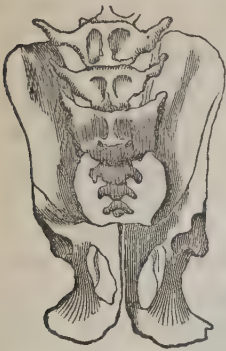

Fig. III.

Pelvis, with two Lumbar Vertebrae, of a large Monkey. Transverse diameter, 2.7, and antero-posterior diameter, 3 inches.—(From Humphry.)

European, and presents a partial approximation to that of the monkey (fig. III.), especially in the deficiency of its width. This difference is very much more obvious in the male than in the female negro; and parturition in the black races is facilitated both by the sacrum being less curved, and by the foetal head being of smaller dimensions. In the apes and monkeys, which approach most nearly to man, the pelvis is longer and narrower, and much less curved than in the human subject. In other mammals, the differences are for the most part the same in kind, but

greater in degree. In many of the Cheiroptera (bats) and Insectivora (as the mole), the pubic bones are only loosely connected by a small ligament, or there is a complete opening between the bones (as occurs normally in birds), an arrangement by which the act of parturition in these animals is much facilitated. The pelvic bones are very simple in the Cetacea, in some cases being represented by two simple elongated bones lying near the anus, and converging from opposite sides (a transverse connecting piece being sometimes but not always present); in others, by a small V-shaped bone, while sometimes (as in *Manatus*) they seem to be entirely wanting. The additional pelvic bones in the non-placental mammals have been already noticed in the articles on the *MARSUPIATA* and *MONOTREMATA*. In the echidna (belonging to the latter order), the acetabulum is perforated, as occurs normally in birds. In birds, in addition to the peculiarity just noticed, we find the pelvis open in front (or, more correctly, inferiorly), there being no union of the pubic bones in any bird except the ostrich. This normal incompleteness of the pelvic ring is obviously for the purpose of facilitating the passage of the eggs.

PEMBA, "the Green Isle" of the Arabs. See SUPPLEMENT in Vol. X.

PEMBROKE, a seaport of South Wales, a market-town, and municipal and parliamentary borough, in the county of the same name, occupies a rocky ridge on a navigable creek of Milford Haven, 7 miles south-east of Milford. On the extremity of the ridge on which the town is built, are the remains of its once extensive castle. In 1648, the castle was beleaguered by Cromwell, and taken after a siege of six weeks. Within this ancient stronghold, Henry VII. was born in 1457. The keep, the principal building in the inner court, is 75 feet high, and 163 feet in circumference, and is surmounted by a cone-shaped roof of masonry, still perfect. *Pater*, otherwise called Pembroke Dock, which is rather a ship-building than a commercial centre, is two miles from the town, and has 12 building-slips and a dry-dock. The entire naval establishment embraces an area of 80 acres, and is surrounded by a high wall, flanked by two martello towers. Within P. are St Michael's, a church of Norman date, and numerous ecclesiastical and educational institutions. Population of parliamentary borough,

15,450; of municipal borough, 13,704. P. unites with Tenby, Milford, and Wiston in sending a member to parliament.

PEMBROKE COLLEGE, Oxford. BROADGATES HALL, a place of education, originally belonging in part to St Frydeswyde's Priory, and in part to the monastery of Abingdon, was, on the dissolution of the religious houses, given to Christ Church by Henry VIII. In 1629, it was made a college by James I., and took its name from the Earl of Pembroke, then chancellor of the university. By the ordinances of the commissioners under 17 and 18 Vict. c. 81, the constitution of the college is now as follows: There are to be not less than 10 fellowships, open to all, not to exceed £200 a year in value, so long as the number of the fellowships is less than 16. There are not to be less than 10 incorporated scholarships, value £50 a year, and rooms free; of these, 5 are open, 5 filled up from Abingdon School. There are besides 11 other scholarships, subject to various conditions. This college presents to 8 benefices, of which 6 have been purchased since 1812.

PEMBROKE COLLEGE, CAMBRIDGE, was founded in 1347 by Mary de St Paul, the widow of Aymer de Valence, Earl of Pembroke. She was maid, wife, and widow all in one day, her husband being slain at a tilting-match held in honour of her nuptials. On this sad event, she sequestered herself from all worldly delights, and bequeathed her estate to pious uses. Henry VI. was so liberal a benefactor to this college as to obtain the name of a second founder. There are 16 fellowships and 24 scholarships of different values.

PEMBROKESHIRE, a maritime county of South Wales, and the westernmost county of the Principality, is bounded on the S. by the Bristol Channel, and on the W. and N. by St George's Channel. Area (census of 1871), 393,682 acres. Pop. (1881) 91,808. The river Teivy separates the county on the north-east from that of Cardigan. On the north are Newport and Fishguard Bays, the latter 3 miles in width, from 30 to 70 feet in depth, and with good anchoring-ground. Off St David's Head, on the west coast, are a number of rocky islets, called the Bishop and his Clerks. St Bride's Bay, the widest inlet, is 8 miles in width, and has an inland sweep of 7 miles. Milford Haven (q. v.) is the most important estuary. The shores on the south are wild and inhospitable, and fronted by high precipitous cliffs. The surface is undulating; green hills alternate with fertile valleys. The principal elevations occur in the Precelly Hills, which traverse the north of the county from east to west, and rise in their highest summit to the height of 1754 feet. The rivers of the greatest importance are the Eastern and Western Cleddau, which unite and form a navigable portion of Milford Haven. None of the rivers, of which the Western Cleddau is the principal, are important. The climate is mild, but damp in the south of the county; while in the north, the temperature is considerably lower. There are excellent and productive soils in the south, and along the north-west coast the barley districts are famous; but the land on the Precelly Mountains and in the coal districts is inferior. Coal, slate, lead, and iron are the only minerals worked. The county is penetrated by the great coal-field of South Wales, which, entering from the east, narrows as it approaches St Bride's Bay. The coal, which is anthracite, and is contained in beds of shale and sandstone, occurs in seams, varying in thickness from a few inches to 6 feet, and sometimes more. Oats, barley, and potatoes are the principal crops. The county returns one member

to parliament. The chief towns are Haverfordwest, St Davids, Pembroke, and Tenby.

PEMMICAN. This was originally a North American Indian preparation only, but it was introduced into the British navy victualling-yards, in order to supply the arctic expeditions with an easily-preserved food, containing the largest amount of nutriment in the smallest space. As made by the Indians, it consists of the lean portions of venison dried by the sun or wind, and then pounded into a paste, and tightly pressed into cakes; sometimes a few fruits of *Amelanchier ovata* are added, to improve the flavour. It will keep for a very long time uninjured. That made for the arctic voyagers was chiefly of beef. In making pemmican, it is necessary to remove the fat completely.

PEMPHIGUS, or POMPHOLYX, belongs to that order of skin-diseases which is characterised by an eruption of large vesicles, filled with serous fluid, and known as *bullæ*. The disease occurs both in the acute and in the chronic form. In a mild case of acute pemphigus, bullæ, or blisters, from the size of a pea to that of a chestnut appear in succession (chiefly on the extremities), and having continued three or four days, break, form a thin scab, and soon heal, unaccompanied with febrile or inflammatory symptoms. In severe cases, there is considerable constitutional disturbance; the bullæ are larger, and the scabs heal with difficulty. The chronic form differs mainly from the acute by its prolonged continuance. The acute variety chiefly affects children, and has been ascribed to dentition, errors of diet, &c.; while the chronic form chiefly attacks aged persons, and is probably due to debility and impaired nutrition. The acute form usually requires nothing but cooling medicines and diet, and mild local dressings, such as simple cerate, to protect the raw surfaces from exposure to the air. In the chronic form, a nutritious diet, with the judicious use of tonics (iron, bark, &c.), is most commonly successful. In obstinate cases, arsenic is sometimes of use.

PEN, an instrument for writing with a fluid. In ancient times, a kind of reed (Lat. *Calamus*) was chiefly used, though sometimes the letters were painted with a fine hair-pencil, as among the Chinese at the present day. Quill-pens (see **QUILLS**) probably came into use after the introduction of modern paper. The English name pen is from Lat. *penna*, a feather; but the old form of *penna* was *penna* or *petna* (= Gr. *peteron*), from the root *pet*, to fly; and just as Lat. *ped* is identical with Eng. *foot* (see letter F), so *petna* or *peteron* corresponds to *feather* (Ger. *feder*). During last century, many efforts were made to improve the quill-pen, the great defect of which was its speedy injury from use, and the consequent trouble of frequent mending; moreover, even the most skilful maker could not insure uniformity of quality, and any variation affected the writer's work. These efforts were chiefly directed to fitting small metal or even ruby points to the nib of the quill-pen; but the delicacy of fitting was so great, that but very little success attended the experiments. At the beginning of this century, pens began to be made wholly of metal; they consisted of a barrel of very thin steel, and were cut and slit so as to resemble the quill-pen as closely as possible. They were, however, very indifferent, and being dear (the retail price at first was half-a-crown, and subsequently sixpence), they made but little way; their chief fault was hardness, which produced a disagreeable scratching of the paper. In 1820, Mr Joseph Gillott, who dealt in the metal pens then made, hit upon an improvement, which,

by removing this great defect, gave a stimulus to the manufacture, which has caused it to be developed to an extent truly marvellous. This consisted in making three slits instead of the single one formerly used, and by this means much greater softness and flexibility were acquired. Mr Gillott also introduced machinery for the purpose of carrying out his improvements, and thereby so reduced the cost of production, that he was enabled to sell his improved pens in 1821 at £7, 4s. per gross, which was then considered a remarkable success. Better pens are now sold at twopence per gross by the same manufacturer; or, in other words, 864 pens for the same price as one pen in 1821. Nor is this to be wondered at, when we are acquainted with the wonderful ingenuity of the machinery by which it is effected. The lowest-priced pens are made almost entirely by machinery, but the better ones require much hand-labour for their completion; nevertheless, in the works of Mr Gillott alone, who is only one of several large manufacturers in Birmingham, the annual production is now nearly 150,000,000 pens, requiring a supply of five tons per week of the fine sheet-steel made for the purpose in Sheffield, a portion of which is returned as scrap or waste for re-manufacture. From Sheffield the steel is sent in sheets about eight feet long by three feet broad; it is prepared from the best iron, generally Swedish *bloom*. The manufacturer then prepares it by dipping for a short time in dilute sulphuric acid, which removes the *scale* or black surface; the acid itself is also carefully removed by immersion in clean water; the sheets are then passed backwards and forwards through a rolling-mill with smooth rollers, which condense the steel, and reduces it to the exact thickness required, it having been previously cut into strips of various widths, according to the kind of pen to be made; for the ordinary kind its width is seen in fig. 1. This is then passed through a cutting-machine, which rapidly punches out pieces of the shape shewn in fig. 2, and in the order shewn in fig. 1, which is a portion of the strip with the pieces or blanks, as they are called, cut out; that which is represented is the waste or scrap previously referred to.

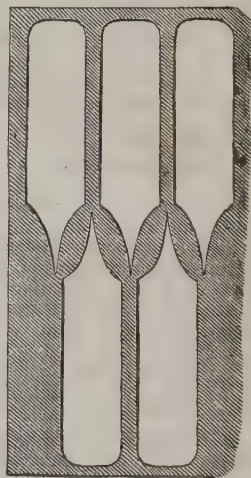

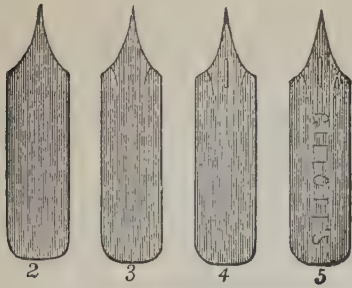

Fig. 1.

The blanks are now passed through a succession of operations, each conducted by a separate person: women or girls are chiefly employed. By the first process after the cutting, they are passed one by one into a machine worked by a small hand-lever, which makes the two side-slits, as seen in fig. 3. *Piercing* is sometimes performed by the same, but more frequently by a similar machine, in which, however, only one punch may act, and cut out the small hole seen in fig. 4. The repeated rolling and stamping of the metal have by this time made it hard and brittle, and it is necessary to anneal it, for which purpose some thousands of the *slit* and *pierced* blanks are put into an iron box, and placed in the fire for a time, which softens them considerably; this is the third process. When cold, another operator receives them and with

another hand-press and a punch stamps or marks, as it is called, the name of the maker, fig. 5, which constitutes the fourth process. The fifth is somewhat similar, and is sometimes omitted; it consists

in placing it under another press, which has a punch and die for embossing any ornamental mark or number. The sixth process, called *raising*, consists in passing it into another press, which has a sinker and grooved die as in fig. 6. The flat blank *a* is pushed under

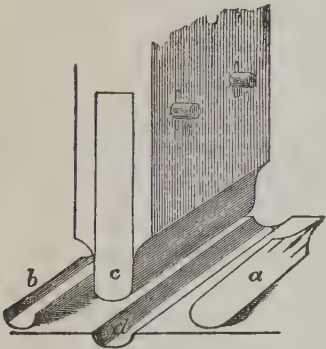

Fig. 6.

the sinker *c*, is pressed by the action of the lever into the groove *d*, and comes out with its edges curved up, as in *b*. The seventh process consists in *hardening*, which is done by placing the pens in an iron box or muffle, and when they are at a red heat, throwing them into oil; this renders them exceedingly brittle and hard, too much so, indeed, for they have now to pass through the eighth or *tempering* process, which brings them to the required temper or hardness and elasticity. The ninth operation is *scouring*; this consists in putting a large number into a tin cylinder, which is kept revolving by machinery; sand and coarse emery-powder are mixed with them; and the friction of these materials and of the pens themselves cleanses them from all impurities, and brings out the natural colour of the metal. The tenth and eleventh processes consist in grinding the outside of the nib, first lengthwise (fig. 7), and then crosswise (fig. 8), which are done by different persons at separate grinding-wheels. Next follows the most important operation, constituting the twelfth process or *slitting*—that is,

making the central slit, upon the nicety of which the whole value of the pen depends. This is done in a hand-press similar to the others, but the cutting part consists of two chisels, one fixed on the table, the other coming down on

the depression of the lever, and so accurately adjusted as to just clear each other. The operator then skilfully holds the pen lengthwise on the fixed chisel, and brings down the movable one, so as to effect the beautifully clean cut which constitutes so important a feature in the manufacture. Two other processes, the thirteenth and fourteenth, finish the series: the first is colouring, by heating them in a revolving cylinder over a charcoal stove, which gives them a blue or yellowish colour, according to the time employed; and the last is varnishing them with a varnish composed of lac and naphtha.

Until within the last ten years the writing public of America has been almost wholly dependent upon the foreign manufacturers for its pens. American-made pens are now rapidly taking the place of the foreign article. The manufactory of Esterbrook & Co. is the most extensive, and they have succeeded in obtaining a very high reputation for their pens throughout the United States. They employ from 150 to 200 hands in their works, and annually consume 40 tons of steel and other metals, making about 300,000 gross of pens. Since their establishment, they have distributed upwards of \$400,000 among the mechanics, &c. of Camden, N. J., and have thus exhibited the advantages of home industry, even when employed in the production of an article so diminutive as a steel pen.

Gold pens are extensively made, and are rendered very durable by soldering to their points minute particles of the extremely hard metal, iridium.

PEN HOLDERS are small turned sticks, usually of cedar, and generally with a steel cylinder to fix the pen. They are used only for metal pens, and are now made by machinery, which is so ingenious, that it turns the cedar, previously cut into square sticks, round, often in a spiral or otherwise ornamental style, cuts them to the required length, and polishes and varnishes them.

PENAL SERVITUDE is a sentence for criminal offences, which was recently introduced in lieu of the sentence of transportation beyond the seas. See **CONVICT**; **TRANSPORTATION**.

PE'NALTY is a sum of money declared by some statute or contract to be payable by one who commits an offence or breach of contract. It is considered as a kind of punishment, and constituting indirectly a motive to the party to avoid the commission of the act which induces such a consequence. Many contracts executed between parties contain a clause that one or other of them who fails to perform his part of the contract, will incur a penalty, i. e., will be liable to pay a fixed sum of money to the other party. In such cases, a distinction is drawn between a liquidated and unliquidated penalty; and whether it is of the one kind or the other, depends on the language used in the contract. If it is a liquidated penalty, then, when the breach of contract is committed, the party in default must pay that precise sum, neither more nor less; but if it is unliquidated, then he is not to pay the whole sum, but merely such part of it as corresponds to the amount of injury or damage done, and of which proportion a jury is the sole judge in an action of damages. In statutes, when penalties are declared to follow on certain illegal acts, the sum is sometimes fixed, but in many cases only a maximum sum is stated, it being left to the court or the justices who enforce the penalty what is a sufficient punishment for the offence. Sometimes penalties can only be sued for by the parties immediately injured; but, as a general rule, and unless it is otherwise restricted, anybody may sue for the penalty, for in an offence against public law, where there is no public prosecutor, any person who chooses

may set the law in motion. Accordingly, not only may anybody in general sue for the penalty, but an inducement is offered by declaring the party who does so to be entitled to the whole or a half of the penalty. Without such inducement, many offences would be unpunished. The party who so sues is generally called the informer. Thus, in offences against the game laws, anybody may sue for the penalty, and he is entitled to half of it. Sometimes the penalty can only be sued for in the superior courts of law; but in the great majority of instances, the enforcing of penalties is part of the administration of justice before justices of the peace. It is for the justices to fix the amount if they have (as they generally have) a discretion to do so. If it is not paid, the justices may issue a distress-warrant, authorising a constable to seize and sell the goods of the party to pay the fine; and if there are no goods, then the justices may commit the party to prison as a substitutionary punishment. Sometimes justices have a discretion either to impose a penalty or commit the party to prison as an alternative punishment. All these matters depend on the construction of particular statutes.

PENANCE (Lat. *pœnitentia*), in Roman Catholic theology, means the voluntary or accepted self-inflicted punishment by which a repentant sinner manifests his sorrow for sin, and seeks to atone for the sin, and to avert the punishment which, even after the guilt has been remitted, may still remain due to the offence. Penance is believed in the Roman Catholic Church to be one of the sacraments of the New Law. It will be necessary to explain it briefly both under its relations as a sacrament, and as a private personal exercise.

Penance must be carefully distinguished from repentance, which is simply sorrow for evil-doing, accompanied with a purpose of amendment. Penance is the fruit or the manifestation of this sorrow, and it is commonly accompanied or expressed by some of those external acts which are the natural manifestations of any deep sorrow, either negative, as the neglect of ordinary attention to dress, to the care of the person, to the use of food; or positive, as the direct acts of personal mortification and self-inflicted pain, such as fasting, wearing haircloth, strewing the head with ashes, watching of nights, sleeping hard, &c. Such manifestations of sorrow, whether from motives of religion or from merely natural causes, are common among the eastern races, and are frequently alluded to in the Scripture. In the personal practice of the early Christians, penance found a prominent place, and the chief and acknowledged object of the stated Fasts (q. v.), and other works of mortification which prevailed, was that of penitential correction, or of the manifestation of sorrow for sin.

A still more striking use of penance, however, in the early church, was the disciplinary one; and this, in the Roman Catholic view, is connected with the sacramental character of penance. Any discussion of this purely theological question would be out of place here, and it will be enough to state briefly that Roman Catholics number penance among the Seven Sacraments (q. v.), and believe it to be of direct divine institution (Matt. xvi. 19, xviii. 18; John xx. 21). The matter of this sacrament consists, in their view, of the three acts of the penitent—contrition, or heartfelt sorrow for sin, as being an offence against God; confession, or detailed accusation of one's-self to a priest approved for the purpose; and satisfaction, or the acceptance and accomplishment of certain penitential works, in atonement of the sin confessed; and the form of the sacrament is the sentence of absolution from

sin pronounced by the priest who has received the confession, and has been satisfied of the penitential disposition of the self-accusing sinner. In all these points, of course, they are at issue with Protestants. Even in the apostolic times, the practice prevailed of excluding persons of scandalous life from the spiritual fellowship of the Christian community (see EXCOMMUNICATION); and without attempting to fix the date, it may be stated as certain, from the authority of Tertullian and other writers, that from a very early time the persons so excluded were subjected to certain penitential regulations. The class of offenders so treated were those who had been notoriously guilty of the grievous crimes of idolatry or apostasy, murder, adultery, and other scandalous offences. The period of penitential probation differed in different times and places, but in general was graduated according to the enormity of the sin, some going so far in their rigour (see NOVATIAN) as, contrary to the clearly-expressed sense of the church, to carry it even beyond the grave. In the earlier ages, much depended upon the spirit of each particular church or country; but about the 4th c., the public penitential discipline assumed a settled form, which, especially as established in the Greek Church, is so curious that it deserves to be briefly described. Sinners of the classes already referred to had their names enrolled, and were (in some churches, after having made a preliminary confession to a priest appointed for the purpose) admitted, with a blessing and other ceremonial, by the bishop to the rank of penitents. This enrolment appears to have commonly taken place on the first day of Lent. The penitents so enrolled were arranged in four grades, called—1. (Gr. *prosklaiontes*, Lat. *flentes*) 'Weepers;' 2. (Gr. *akroōmenoi*, Lat. *audientes*) 'Hearers;' 3. (Gr. *hypopiptontes*, Lat. *prosternentes*) 'Prostraters;' 4. (Gr. *syntantes*, Lat. *consistentes*) 'Standers.' Of these classes, the first were obliged to remain outside of the church at the time of public worship, and to ask the prayers of the faithful as they entered. The second were permitted to enter and to remain in the place and during the time appointed for the Catechumens (q. v.); but, like them, were required to depart before the commencement of the solemn part of the Liturgy (q. v.). The third were permitted to pray with the rest, but kneeling or prostrate, and for them were prescribed many other acts of mortification. The fourth were permitted to pray with the rest in a standing posture, although apparently in a distinct part of the church; but they were excluded from making offerings with the rest, and still more from receiving the communion. The time to be spent in each of these grades at first differed very much according to times and circumstances, but was afterwards regulated by elaborate laws, called penitential canons. Still it was in the power of the bishop to abridge or to prolong it; a power, the exercise of which is connected with the historical origin of the practice of Indulgence (q. v.). Of these four grades, the first two hardly appear in the Western Church. It is a subject of controversy whether, and how far, this discipline was extended to other than public sinners; but it seems certain that individuals, not publicly known as sinners, voluntarily enrolled themselves among the penitents. All four grades wore a distinguishing penitential dress, in which they appeared on all occasions of public worship, and were obliged to observe certain rules of life, to renounce certain indulgences and luxuries, and to practise certain austerities. In some churches, they were employed in the care of the sick, the burial of the dead, and other of the more laborious works of charity. The penitent, in

ordinary cases, could only be restored to communion by the bishop who had excluded him, and this only at the expiration of the appointed time, unless the bishop himself had shortened it; but, in case of dangerous illness, he might be restored, with the condition, however, that, if he recovered from the illness, the whole course of penance should be completed. The reconciliation of penitents took place commonly in Holy Week, and was publicly performed by the bishop in the church, with prayer and imposition of hands. It was followed by the administration of communion. If any of the clergy were guilty of a crime to which public penance was annexed, they were first deposed from the rank of the clergy, and then subjected to the ordeal, like the laity themselves. This public discipline continued in force with greater or less exactness in the 5th, 6th, and 7th centuries, gradually, however, being replaced by semi-public, and ultimately by private penance. In the 11th and 12th centuries, the public penance had entirely disappeared. The nature and origin of *private penance* is a subject of controversy between Catholics and Protestants; the former contending that it had existed from the first, and that it held the same place even in the ages of public penance for *secret sins* which the public penance did for public offences. At all events, from the date of the cessation of the public discipline, it has existed universally in the Roman Church. The priest, in absolving the penitent, imposes upon him the obligation of reciting certain prayers, undergoing certain works of mortification, or performing certain devotional exercises. These acts of the penitent are held to form an integral part of the sacrament of penance.

According to Protestants, penance has no countenance whatever from Scripture, and is contrary to some of the most essential principles of the Christian religion; particularly to the doctrine of justification by faith in Jesus Christ alone, on the ground of his complete or 'finished' work; penance being, in fact, founded on a doctrine of—at least—supplementary atonement by the works or sufferings of man—the sinner—himself. The outward expressions of humiliation, sorrow, and repentance common under the Jewish dispensation, are regarded as very consistent with the character of that dispensation, in which so many symbols were employed. It is also held, that the self-inflicted austerities, as fasting, sackcloth and ashes, &c., of Jewish and earliest Christian times, had for their sole purpose the *mortification* of unholiness and sinful passions in the people of God; or the expression of sorrow for sin, so that others beholding might be warned of its evil and restrained from it; all which is perfectly consistent with the principles of Christianity, if kept within the bounds of moderation and discretion. But penance in any other view, as a *personal exercise*, is utterly rejected. Arguments founded on the meaning of the two Greek words *metanoēs* and *metameleomai*, both translated in our English version *repent*, are much urged by many Roman Catholic controversialists—the former being represented as equivalent to the English *Do Penance*; but this is condemned by Protestants as inconsistent with the very use of the words in the New Testament itself. That penance began, as a practice, very early in the Christian church, is not only admitted by Protestants, but alleged in proof of the very early growth of those corruptions which finally developed themselves in the doctrines and practices of the Roman Catholic Church, and of which Protestants also hold that there are plain intimations in the New Testament, not only prophetic, but shewing

the development of their germs to have already begun during the age of the apostles.

In the discipline of the Protestant churches, penance is now unknown. The nearest approach to the Roman Catholic polity on the subject was that in use among the English Puritans of the 17th c., and more particularly in the Church of Scotland during that and the succeeding century, when it was common 'to make satisfaction publicly on the Stool of Repentance' (q. v.). It does not seem to have occurred to the Reformers or their more immediate successors in the Protestant churches, that their system of discipline, with its public rebukes and enforced humiliations of various kinds—as the wearing of a sackcloth robe, and sitting on a particular seat in church—was liable to be interpreted in a sense very different from that of a mere expression of sorrow for sin; but the belief is now very general among the most zealous adherents of their doctrinal opinions, that in all this they adopted practices incongruous with their creed, and in harmony rather with that of the Church of Rome. Nor do they seem to have perceived that Church-Discipline (q. v.), in its proper sense, as relating to ecclesiastical rights and privileges, is wholly distinct from the imposition of penalties by churches or church courts. Penitential humiliations, imposed by ecclesiastical authority, are now no more in favour where church discipline is most strict, than where the utmost laxity prevails. The commutation of penalties deemed shameful, for a fine to the poor of the parish, was an abuse once prevalent in Scotland, but never sanctioned by the higher ecclesiastical authorities.

PENANG. See PULO-PENANG.

PENANG LAWYERS, the commercial name for the stems of a species of palm imported from Penang for walking-sticks. They are small and hard, and have a portion of the root-stock attached, which is left to form the handle.

PENATES. See LARES, MANES, and PENATES.

PENCILS are instruments for writing, drawing, and painting, and they differ as much in their construction as in the uses to which they are applied. Probably the pencil was the first instrument used by artists, and consisted then of lumps of coloured earth or chalk simply cut into a form convenient for holding in the hand. With such pencils were executed the line-drawings of Aridices the Corinthian, and Telephanes the Sicyonian, and also the early one-coloured pictures, or *monochromata*, of the Greeks and Egyptians; but as wet colours began to be used, small fine-pointed brushes would be required, and we find it recorded that as early as the 4th c. B. C., several Greek artists had rendered the art of painting with hair-pencils so famous, that some of their pictures sold for vast sums of money. There are now in use the following kinds of pencils: hair-pencils, black-lead pencils, chalk-pencils, and slate-pencils. The first are used for painting or writing with fluid colours, either oil or water, and in China and Japan are employed almost entirely instead of pens for writing; the colour used being the black or brown pigment obtained from various species of sepia or cuttlefish. The manufacture of hair-pencils is of great importance, and requires much care and skill. The hairs employed are chiefly those of the camel, badger, sable, mink, kolinski, fitch, goat, and the bristles of hogs; and the art of pencil-making requires that these hairs shall be tied up in cylindrical bundles, so nicely arranged that all their naturally fine points shall be in one direction, and that the central one shall project the furthest, and the others in succession shall recede,

so that, collectively, the whole shall form a beautifully smooth cone, the apex of which is a sharp point. Black-lead pencils are made of graphite or plumbago, which contains no lead whatever in its composition, but is in reality almost pure carbon. See BLACK-LEAD. The misnomer is probably owing to the fact, that, previous to the employment of graphite for making pencils, common lead was used, and this was the case even within the present century. Consequently, as the plumbago, with its black streak, offered a contrast to the pale one of the lead, it was called in contradistinction *black-lead*.

The best graphite for drawing-pencils was formerly obtained in the Cumberland mines, which were celebrated. Within the last few years, however, vast deposits of this mineral, of a very fine quality, have been discovered in Siberia and other parts of the Russian empire. Large quantities are found in Austria and Prussia, in Ceylon, and in various parts of North America; and they are now used in pencil-making, both for superior and inferior kinds. Black-lead is rarely sufficiently free from sand and other foreign ingredients to be used without preparation; it is therefore generally ground fine, and levigated or washed until it is pure, and again formed into solid blocks by means of enormous pressure, generally in hydraulic presses; these blocks are then sawn into thin plates about the sixteenth of an inch in thickness, which are again cut across, so as to form them into small square sticks.

It may appear a very simple process to press the powdered graphite into blocks, but it was found so difficult in practice as almost to prevent the employment of this method, which has led to immense improvement in pencil-making. It was found at first that the difficulty of pressing out the contained air was so great that the presses were broken under the weight required; pressure in a vacuum was then tried, but the difficulty of applying it was found almost insurmountable, and it was certainly unprofitable. Mr Brokedon of London, who has long been famous for his pencils, at last surmounted the difficulty by an ingenious and very simple process. This consists in compressing the black-lead into blocks two or three inches square, with only moderate pressure; these are then coated over with paper, well glued, so that, when dry, the covering is air-tight. A small hole is now made through this coating on one side, and several of these cubes of black-lead are put under the receiver of an air-pump, and the air being exhausted completely from them, the orifice in each is closed by an adhesive wafer, which prevents the return of the air when they are taken out of the receiver. They are next placed under the hydraulic press, and a well-sustained and regular pressure is brought to bear upon them for twenty-four hours, after which they are found to be so completely consolidated, that in cutting them the substance is equal in density to the best specimens of unprepared graphite. There is so large a variation in the colour of various qualities of black-lead, that, by a judicious mixture of them, when in the powdered state, almost any shade of darkness can be procured; but instead of thus carefully combining different qualities of graphite, it is a common practice to add sulphur or sulphuret of antimony, and by heating to procure the desired degree of blackness. For very inferior pencils, the worst quality of black-lead is mixed with black chalk and size, or gum-water, and formed into a paste, of which the pencil is made.

It is usual to enclose the material constituting the essential part of the pencil in a case of wood, for

its protection from breakage, and to prevent its soiling the hands. The wood (generally cedar) is first sawn into thin boards, about half the thickness of the intended pencils; these are then cut into small pieces about ten inches long, by six in width, which are placed in the cutting and grooving machine. This machine consists principally of two circular saws—one very thin, and so set that it will cut through the board; the other revolving within the eighth of an inch of it, so set as only to cut a fine square groove in the wood. By means of this machine, the little boards are cut into straight square sticks, each having a groove on one surface. Into these grooves, the little prepared sticks of black-lead are laid and covered with a similar piece of wood, but not grooved. A workman, who is called the 'fastener-up,' having glued the inner faces of the two pieces of wood, presses them together, and sets them to dry; after which they are passed through the rounding-machine, dressed with a semi-circular smoothing-plane, cut at the ends, and then polished by rubbing them with a piece of shark-skin. The last process is stamping them with the maker's name and the letter which designates their peculiar quality. These letters are H, HH, HHH, B, BB, BBB, HB, FS. H signifies *hard*; repeated twice and thrice, it means *harder* and *very hard*. B means *black*, HB *hard and black*, and so on. FS signifies *fine stroke*.

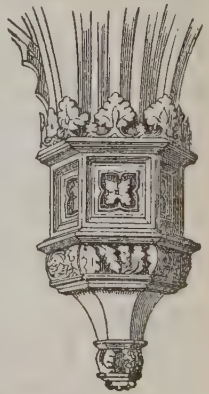

Chalk-pencils are made in a similar manner, only that finely-powdered coloured chalks, such as are used for crayons, are substituted for the black-lead. Previous to pressing and cutting the chalk, it is mixed with a little hot melted wax, which gives it softness and adhesiveness.

Slate-pencils for writing on slate are made either by cutting slate into thin sticks, and rounding them, or by cutting it into fine square slips, and encasing them in wood, as in the case of black-lead, &c

PENDANT, or PENNANT, is a narrow flag of great length, tapering to a point, and carried at the head of the principal mast in a royal ship, to shew that she is in commission. In the British navy, the pendants are borne of three colours—red, white, or blue—according to the colour to which the admiral commanding the fleet pertains. See FLAG-OFFICER. A *broad-pennant* is a blue pennant, shorter and broader than the above, carried at the mast-head of a commodore's ship, to denote that her captain is the commodore on the station. A first-class commodore hoists his broad-pennant at the fore; if of the second-class, his flag flies at the mizzen.

The *rudder-pendants* are strong ropes spliced in the rings of the rudder-chain, to prevent the loss of the rudder, should it by any accident become unshipped.

PENDANT, a hanging ornament, used in ceilings, vaults, staircases, timber-rooms, &c. It is sometimes a simple ball, and sometimes elaborately ornamented, and is chiefly used in the later Gothic and Elizabethan styles

Pendant.

PENDENTIVE, the portion of a vault resting on one pier, and extending from the springing to the apex.—The word pendentive is also applied to

the portions of vaults introduced in the angles of rectangular compartments, in order to reduce them to a circular or other suitable form to receive a dome.

PENDLETON, a township of Lancashire, with a station on the Lancashire and Yorkshire Railway, is a suburb of Manchester, and is $2\frac{1}{2}$ miles west-north-west of the town of that name. In 1851, it contained 14,224; in 1861, 20,900; and in 1881 it had increased to 48,409 inhabitants. Pendleton is part of the parliamentary borough of Salford, and since 1852 it has been incorporated with the municipality of the same borough. The rapid increase of its population is due to the immense industry of the locality. The inhabitants are employed in the numerous cotton and flax mills, print and dye-works, iron foundries, soap, and chemical works, in operation here. Hundreds of the population are also employed in the well-known P. collieries, which are conducted with much enterprise by the lessees. P. is also the residence of a portion of the mercantile community from Manchester, whose large mansions, with their parks and gardens, are dotted at intervals along the two roads leading from the township westward to Eccles.

PENDULUM, in its widest scientific sense, denotes a body of any form or material which, under the action of some force, vibrates about a position of stable equilibrium. In its more usual application, however, this term is restricted, in conformity with its etymology (Lat. *pendeo*, to hang), to bodies suspended from a point, or oscillating about an axis, under the action of gravity, so that, although the laws of their motion are the same, Rocking Stones (q. v.), Magnetic Needles, Tuning-forks, Balance wheel of a watch, &c., are not included in the definition.

The *simple pendulum* consists (in theory) of a heavy point or particle, suspended by a flexible string without weight, and therefore constrained to move as if it were always on the inner surface of a smooth spherical bowl. If such a pendulum be drawn aside into a slightly-inclined position, and allowed to fall back, it evidently will oscillate from side to side of its position of equilibrium, the motion being confined to a vertical plane. If, instead of being allowed to fall back, it be projected horizontally in a direction perpendicular to that in which gravity tends to move it, the bob will revolve about its lowest position; and there is a particular velocity with which, if it be projected, it describes a circle about that point, and is then called a *conical pendulum*. As the theory of the simple pendulum can be very easily

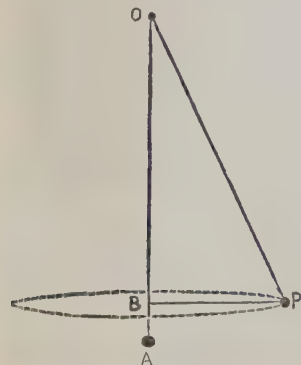

Fig. 1.

In the fig. let O be the point of suspension, OA the pendulum in its lowest position, P the bob in any position in the (dotted)

explained, by reference to that of the conical pendulum, we commence with the latter, which is extremely simple. To find the requisite velocity, we have only to notice that the (so-called) Centrifugal Force (q. v.) must balance the tendency towards the vertical. This tendency is not directly due to gravity, but to the tension of the suspending cord. In

circle which it describes when revolving as a conical pendulum; PB, a radius of the dotted circle, is evidently perpendicular to OA. Now, the centrifugal force is directly as the radius PB of the circle, and inversely as the square of the time of revolution. Also the radius PB is $PO \sin BOP$, the length of the string multiplied by the sine of the angle it makes with the vertical; and the force towards the vertical is proportional to the earth's attraction, and to the tangent of the above angle—as may be at once seen from the consideration that the three forces acting on the bob at P are parallel, and therefore proportional, to the sides of the triangle OBP. Hence the square of the time of revolution is directly as the length of the string and the sine of the angle BOP, and inversely as the earth's attraction and the tangent of the same angle; or (what is easily seen to be equivalent) to the length of the string and the cosine of its inclination to the vertical directly, and to the earth's attraction inversely. Hence, in any given locality, all conical pendulums revolve in equal times, whatever be the lengths of their strings, so long as their heights are equal; the height being the product of the length of the string by the cosine of its inclination to the vertical. Also the squares of the times of revolution of conical pendulums are as their heights directly, and as the earth's attraction inversely.

Now, so long as a conical pendulum is deflected only through a very small angle from the vertical, the motion of its bob may be considered as compounded of two equal simple pendulum oscillations in directions perpendicular to each other, such as it appears to make to an eye on a level with it and viewing it at some distance, first from one point, say on the north, and then from another 90° round, say on the east. And these motions take place, by Newton's second law (see MOTION, LAWS OF), independently. Also the time of a (double) oscillation in either of these directions is evidently the same as that of the rotation of the conical pendulum. Hence, for small arcs of vibration, the square of the time of oscillation of a simple pendulum is directly as its length, and inversely as the earth's attraction. Thus, the length of the second's pendulum at London being 39.1393 inches, that of the half-second's pendulum is 9.7848 inches, or one-fourth; that of the two seconds' pendulum 156.5572 inches, or four times that length. It follows from the principle now demonstrated, that so long as the arcs of vibration of a pendulum are all small relatively to the length of the string, they may differ considerably in length among themselves without differing appreciably in time. It is to this property of pendulum oscillations, known as *isochronism* (q. v.), that they owe their value in measuring time. See HOROLOGY.

That the times of vibration of different pendulums are as the square roots of their lengths, may be demonstrated to the eye by a very simple experiment. Suspend three musket balls on double threads as in the figure, so that the heights in the dotted line may be as 1, 4, and 9. When they are made to vibrate simultaneously, while the lowest ball makes one oscillation the highest will be found to make three, and the middle ball one and a half.

A pendulum of given length is a most delicate instrument for the measurement of the relative amounts of the earth's attraction at different

Fig. 2.

places. Practically, it gives the kinetic measurement of gravity, which is not only by far the most convenient, but also the true measure. By this application of the pendulum, the oblateness of the earth has been determined, in terms of the law of decrease of gravity from the poles to the equator. The instrument has also been employed to determine the mean density of the earth (from which its mass is directly derivable), by the observation of its times of vibration at the mouth and at the bottom of a coal-pit. It was shewn by Newton, that the force of attraction at the bottom of a pit depends only upon the internal nucleus which remains when a shell, everywhere of thickness equal to the depth of the pit, has been supposed to be removed from the whole surface of the earth. The latest observations by this method were made by Airy, the present astronomer-royal, in the Harton coal-pit, and gave for the mean density of the earth a result nearly equivalent to that deduced by Cavendish and Maskelyne from experiments of a totally different nature. See EARTH.

If the bob of the simple pendulum be slightly displaced in any manner, it describes an ellipse about its lowest position as centre. This ellipse may, of course, become a straight line or a circle, as in the cases already considered. The bob does not accurately describe the same curve in successive revolutions; in fact, the elliptic orbit just mentioned rotates in its own plane about its centre, in the same direction as the bob moves, with an angular velocity nearly proportional to the area of the ellipse. This is an interesting case of *progression of the apse* (Apsides, q. v.), which can be watched by any one who will attach a small bullet to a fine thread; or, still better, attach to the lower end of a long string fixed to the ceiling a funnel full of fine sand or ink which is allowed to escape from a small orifice. By this process, a more or less permanent trace of the motion of the pendulum is recorded, by which the elliptic form of the path and the phenomena of progression are well shewn.

According to what is stated above, there ought to be no progression if the pendulum could be made to vibrate simply in a straight line, as then the area of its elliptic orbit vanishes. It is, however, found to be almost impossible in practice to render the path absolutely straight; so that there always is from this cause a slight rate of change in the position of the line of oscillation. But as the direction of this change depends on the direction of rotation in the ellipse, it is as likely to affect the motion in one way as in the opposite, and is thus easily separable from the very curious result obtained by Foucault, that on account of the earth's rotation, the plane of vibration of the pendulum *appears to turn* in the same direction as the sun, that is, in the opposite direction to the earth's rotation about its axis. To illustrate this now well-known case, consider for a moment a simple pendulum vibrating at the *pole* of the earth. Here, if the pendulum vibrates in a straight line, the direction of that line remains absolutely fixed in space, while the earth turns round below it once in 24 hours. To a spectator on the earth, it appears, of course, as if the plane of motion of the pendulum were turning once round in 24 hours, but in the opposite direction. To find the amount of the corresponding phenomenon in any other latitude, all that is required is to know the rate of the earth's rotation about the vertical in that latitude. This is easy, for velocities of rotation are resolved and compounded by the same process as forces, hence the rate at which the earth rotates about the vertical in latitude λ is less than that of rotation about the polar axis in the ratio of $\sin. \lambda$

to 1. Hence the time of the apparent rotation of the plane of the pendulum's motion is $\frac{24 \text{ hours}}{\sin. \lambda}$. At

the pole, this is simply 24 hours; at the equator, it is infinitely great, or there is no effect of this kind; in the latitude of Edinburgh ($56^\circ 57' 23.2''$), it is 28.63 h., or 23 h. 37 m. 48 s.

We have not yet alluded to the obvious fact, that a *simple* pendulum, such as we have described above, exists in theory only, since we cannot procure either a single heavy particle, or a perfectly light and flexible string. But it is easily shewn, although the process cannot be given here, that a rigid body of any form whatever vibrates about an axis under the action of gravity, according to the same law as the hypothetical simple pendulum. The length of the equivalent simple pendulum depends upon what is called the Radius of Gyration (q. v.) of the pendulous body. Its property is simply this, that if the whole mass of the body were collected at a point whose distance from the axis is the radius of gyration, the moment (q. v.) of inertia of this heavy point (about the axis) would be the same as that of the complex body. The square of the radius of gyration of a body about any axis, is greater than the square of the radius of gyration about a parallel axis through the centre of gravity, by the square of the distance between those lines. Now, the length of the simple pendulum equivalent to a body oscillating about any axis is directly as the square of the radius of gyration, and inversely as the distance of the centre of gravity from the axis. Hence, if k be the radius of gyration of a body about an axis through the centre of gravity, $\sqrt{k^2 + h^2}$ is that about a parallel axis whose distance from the first is h ; and the length, l , of the equivalent simple pendulum is $l = \frac{k^2 + h^2}{h}$.

This expression becomes infinitely great if h be very large, and also if h be very small (that is, a body vibrates very slowly about an axis either far from, or near to, its centre of gravity). It must therefore have a minimum value. By solving the equation above as a quadratic in h , we find that l cannot be less than $2k$, which is, therefore, the length of the simple pendulum corresponding to the quickest vibrations which the body can execute about any axis parallel to the given one. In this case, the value of h is equal to k . Hence, if a circular cylinder be described in a body, its axis passing through the centre of gravity, and its radius being the radius of gyration about the axis, the times of oscillation about all generating lines of this cylinder are equal, and less than the times of oscillation about any other axes parallel to the given one. Also, since the formula for l , above given, may be thus written, $h(l - h) = k^2$, it is obvious that it is satisfied if $l - h$ be put for h . Hence, if any value l (of course not less than $2k$) be assigned as the length of the equivalent simple pendulum, there are *two* values of h which will satisfy the conditions; that is, there are two concentric cylinders, about a generating line of either of which the time of oscillation is that of the assigned simple pendulum. When $l = 2k$, these cylinders coincide, and form that above described. And, since the sum of the radii of these cylinders is l , it is obvious that if we can find experimentally two parallel axes about which a body oscillates in equal times, and if the centre of gravity of the body lie *between* these axes, and in their plane, the distance between these axes is the length of the equivalent simple pendulum. This result is of very great importance, because it enabled Kater (who was the first to employ it) to use the complex pendulum for the determination of the length of the simple

second's pendulum in any locality. The simple pendulum is perfect in theory, but cannot be constructed; and thus the method which enables us to obtain its results by the help of such a pendulum as we can construct, is especially valuable.

Compensation Pendulum.—As the length of a rod or bar of any material depends on its temperature (see HEAT), a clock with an ordinary pendulum goes faster in cold, and slower in hot, weather. Various contrivances have been devised for the purpose of diminishing, if not destroying, these effects. The most perfect in theory, though perhaps not the most available in practice, is that of Sir D. Brewster (q. v.), founded upon the experimental discovery of Mitscherlich, that some crystals expand by heat in one direction, while contracting in the perpendicular one; and therefore that a rod may be cut out of the crystal in such a direction as not to alter in length by any change of temperature. In the method of correction usually employed, and called *compensation*, advantage is taken of the fact that different substances have different coefficients of linear dilatation; so that if the bob of the pendulum be so suspended as to be raised by the expansion of one substance, and depressed by the expansion of another, the lengths of the effective portions of these substances may be so adjusted that the raising and depression, taking place simultaneously, may leave the position of the bob unaffected. There are two common methods of effecting this, differing a little in construction, but ultimately depending on the same principle. Of these, the *mercurial pendulum* is the more easily described.

Fig. 3.

The rod AC, and the framework CB, are of steel. Inside the framework is placed a cylindrical glass jar, nearly full of mercury, which can be raised or depressed by turning a nut at B. By increase of temperature, the steel portion AB is lengthened by an amount proportional to its length, its coefficient of linear dilatation, and the change of temperature, conjointly—and thus the jar of mercury is removed from the axis of suspension. But neglecting the expansion of the glass, which is very small, the mercury rises in the jar by an amount proportional to its bulk, its coefficient of cubical dilatation, and the change of temperature, conjointly. Now, by increasing or diminishing the quantity of mercury, it is obvious that we may so adjust the instrument that the length ($\frac{k^3}{h}$) of the equivalent simple

pendulum shall be unaltered by the change of temperature, whatever be its amount, so long as it is not great enough to sensibly change the coefficients of dilatation of the two metals. The screw at B has nothing to do with the *compensation*, its use is to adjust the length of the pendulum so that it shall vibrate in one second.

The construction of the *gridiron pendulum* will be easily understood from the cut. The black bars be steel, the shaded ones are brass, copper, or some substance whose coefficient of linear dilatation is more than double that of steel. It is obvious from the figure that the horizontal bars are merely connectors, and that their expansion has nothing to do with the vibration of the pendulum, so they may be made of any substance. It is easily seen that an increase of temperature lowers the bob by expanding the steel rods, whose effective length consists of the sum of the lengths of Aa, BC, and the steel bar to which the bob is attached; while it raises the bob by expanding the brass bars, whose effective length is that of one of them only; the other, as well

as the steel rod bc, being added to the instrument for the sake of symmetry, strength, and stiffness only. If the effective lengths of steel and brass be inversely as their respective dilatation coefficients, the position of the bob is unaltered by temperature; and therefore the pendulum will vibrate in the same period as before heating. This is on the supposition that the weight of the framework may be neglected in comparison with that of the bob; if this weight must be taken into account, the requisite adjustments, though possible, are greatly more complex, and can only be alluded to here. Practically, it is found that a strip of dry fir-wood, carefully varnished, to prevent the absorption of moisture, and consequent hygrometric alterations of its length, is very little affected by change of temperature; and, in many excellent clocks, this is used as a very effective substitute for the more elaborate forms just described. To give an idea of the nicety which modern astronomy requires in the construction of an observing clock, we may mention that the Russian astronomers find the gridiron superior to the mercurial pendulum; because differences of temperature at different parts of the clock case (though almost imperceptible in a properly protected instrument), may heat the steel or the mercury unduly in the latter; while, in the former, the steel and brass bars run side by side through the greater part of the length of the pendulum, and are thus simultaneously affected by any such alterations of temperature.

Fig. 4.

It would lead us into details of a character far too abstruse for the present work to treat of the effects of the hydrostatic pressure and viscosity of the air upon the motion of a pendulum.

PENELOPÉ, in Homeric legend, the wife of Ulysses (Odysseus), and mother of Telemachus, who was still an infant when Ulysses went to the Trojan war. During his long wanderings after the fall of Troy, he was generally regarded as dead, and P. was vexed by the urgent suits of many lovers, whom she put off on the pretext that she must first weave a shroud for Laertes, her aged father-in-law. To protract the time, she undid by night the portion of the web which she had woven by day. When the suitors had discovered this device, her position became more difficult than before; but fortunately Ulysses returned in time to rescue his chaste spouse from their distasteful importunities. Later tradition represents P. in a very different light, asserting that by Hermes (Mercury), or by all her suitors together, she became the mother of Pan (q. v.), and that Ulysses, on his return, divorced her in consequence. But the older Homeric legend is the simpler and more genuine version of the story.

PENGUIN (*Aptenodytes*), a genus of birds of the family *Alcidae* (see AUK), or constituting the family *Aptenodidae*, regarded by many as a sub-family of *Alcidae*, and divided into several genera or sub-genera. They have short wings, quite unfit for flight, but covered with short rigid scale-like feathers, admirably adapted for swimming, and much like the flippers of turtles. The legs are very short, and are placed very far back, so that on land penguins rest on the tarsus, which is widened like the sole of the foot of a quadruped, and maintain a perfectly erect posture. Their bones, unlike those of birds in general, are hard, compact, and heavy, and have no air-cavities; those of the extremities contain an oily marrow. The body is of an elliptical

form; the neck of moderate length; the head small; the bill moderately long, straight, more or less compressed; the tail very short. Some of them have a long, slender, and pointed bill, the upper mandible a little curved at the tip, and

Penguin (*Aptenodytes pennatis*).

feathered for about a third of its length; some, sometimes called Gorfews or Gorfous (*Chrysocoma*), have a stout and pointed bill, a little curved at the tip; some, *Sphenisques* or *Spheniscans* (*Spheniscus*), have a straight and compressed bill, irregularly furrowed at the base. The Penguins are all among the most aquatic birds, although they are seldom seen very far out at sea; but it is only in the breeding season that they spend much time on shore. They are found only in the southern hemisphere, and chiefly in high southern latitudes, although some of the species extend into warm regions, as *Spheniscus Humboldtii* to the coast of Peru. Of this species, which is called *Pazaro niño*, or Child Bird, by the Peruvians, Tschudi states that it is easily tamed, becomes very sociable, and follows its master like a dog, waddling along in a very amusing manner with its plump body and short legs, keeping its balance by motions of its little wings. It displays considerable intelligence, and learns to answer to its name. In some of the furthest antarctic regions, penguins are prodigiously numerous, appearing on the shore like regiments of soldiers, or, according to another similitude which has been used by a voyager, like bands of little children in white aprons. They often occupy for their breeding ground a space of several acres, which is laid out and levelled and divided into squares, as nicely as if it had been done by a surveyor; whilst between the compartments they march as accurately as soldiers on parade. The KING P. (*A. Patagonica*), a large species, of the size of the great auk, dark grayish-blue above, white beneath, with a black head and a yellow curved band on the throat, is found in such numbers on some of the sandy antarctic coasts, that Mr Bennett describes one breeding ground on Macquarie Island as covering thirty or forty acres, and, to give some notion of the multitudes, speaks of 30,000 or 40,000 birds as continually landing and as many putting to sea. On many of the antarctic shores, the penguins do not flee from nor seem to dread the presence of man, remaining as if stupidly indifferent, even when their companions are knocked on the head; their very indifference, it is said, suggesting

the idea of loneliness and desolation more powerfully than if there were a total absence of life. When attacked, however, they often shew courage in self-defence, and are ready to run with open bill at an invader. The young are reckoned good eating; the old are said to be black and tough. The name P. is said to be derived from the Latin *pinguis*, fat.—Penguins make no nest, but lay a single egg in a chosen place on the shore; and the egg is carefully tended both by male and female. The female P. keeps charge of her young for nearly twelve months.—Many of the penguins are birds of bright plumage.—Cuttlefish, and other *Cephalopoda*, form a great part of their food. Their voice is loud and harsh, between a quack and a bray, but there are many diversities in the different species.

PENICILLARIA. See GUINEA CORN and MILLET.

PENITENTIAL PSALMS, seven of the Psalms of David, so called as being specially expressive of sorrow for sin, and accepted by Christian devotion as forms of prayer suitable for the repentant sinner. They are Psalms vi., xxxii., xxxviii., li., ciii., cxxx., and cxlii. according to the Authorised Version, which correspond with vi., xxxi., xxxvii., l., ci., cxxix., and cxli. of the Vulgate. These Psalms have been set apart from a very early period, and are referred to as such by Origen (Hom. ii. in Leviticum). Pope Innocent III. ordered that they should be recited in Lent. They have a special place in the Roman Breviary, and more than one of the popes attached an indulgence to the recital of them. The most deeply penitential, and the most frequent in use, both public and private, is the 51st Psalm, or the *Miserere* (50th in the Vulgate).

PENITENTIARIES, a name applied to prisons under the separate system adopted by the Friends of Pennsylvania in 1786, when they caused the legislature of that state to abolish the punishments of death, mutilation, and the whip, and to substitute solitary confinement as a reformatory process. The name has been extended, and there are now two systems of penitentiaries in the United States—that known as the Pennsylvania, or separate (not solitary), and the Auburn, or silent collective system. By the former the prisoners are lodged in separate well-ventilated cells, where they are required to work during stated hours, and where they are secluded from the gaze of the public and from contact with, or any knowledge of the presence of, fellow-prisoners. Here they receive visits from the moral instructor and committees of benevolent men and women, who labour for their reclamation from the influence of evil desires, are supplied with books, and become, under their kindly agencies, prepared for exposure to the temptations of the outer world. The punishments to which they are subjected are deprivation of food for short periods, and confinement without labour in the dark—discipline which has proved effective without the application of corporeal punishment, which is prohibited. Objections have been made to this system based upon its supposed unhealthiness, and the increased tendency to insanity from the want of social influences; but they are believed to be without force. By the Auburn, or New York system, the prisoners are not separated during working hours, nor at their meals, but are required to maintain strict silence and refrain from any communication with one another, and are locked in separate cells by night. They labour in extensive workshops as carpenters, blacksmiths, &c. Discipline is enforced by whipping, but is said to be rarely exercised. The objections to this system are that prisoners do communicate with one another, and that the exposure thus made prevents a return to virtue, while the discipline degrades the convict and keeps alive his baser passions.

PENITENTIARY (Lat. and Ital. *penitentiarius*), the name given to one of the offices of the Roman court, and also the dignitary (a cardinal, called *Penitentiarius*) who presides over it. The cardinal penitentiary must be a priest and a doctor of theology or canon law. He is named by the pope himself, and should the penitentiary die while the Roman see is vacant, the cardinals must be specially assembled to elect by secret scrutiny a pro-penitentiary to act for the time. The officials of the penitentiary, under the cardinal penitentiary, are a regent, three secretaries, three clerks, a corrector, a consultant in theology, and another in canon law, and one or two minor officers. The subjects which come under the notice of the penitentiary are all matters relating to the confessional, especially the absolution from sins and from canonical censures, reserved to the pope, and in certain cases dispensations from the impediments of marriage.

PENN, WILLIAM, a celebrated English Quaker and philanthropist, the founder of the colony of Pennsylvania, the son of Sir William Penn, an eminent English admiral, was born at London, 14th October, 1644. His early years were spent partly in Essex and partly in Ireland, where his father had several estates. He studied at Christ Church, Oxford, and while there was converted to Quakerism by the preaching of a disciple of George Fox, named Thomas Loe. His enthusiasm for his new faith assumed an aggressive form, for not only did he object to attend the services of the Church of England, and to wear the surplice of a student, both of which he considered eminently papistical, but, along with some companions who had also become Quakers, he attacked several of his fellow-students, and tore the obnoxious robes from their backs. For this unseemly procedure he was expelled from the university. His father was so annoyed at his conduct, that he gave him a beating, and turned him out of doors; but he was soon afterwards appeased, and sent him on his travels, in the hope that new scenes and the gaiety of French life would change the bent of his mind. They failed, however, of their purpose, though the youth certainly acquired a grace and suavity of address he did not before possess. In 1666 the admiral sent him to Ireland to look after his estates in the county of Cork, which Penn did to his father's complete satisfaction; for in matters of business he was as practical an Englishman as in religion he was spiritually-minded. In the city of Cork, however, he again fell in with Thomas Loe, and for attending a Quaker meeting was, along with some others, imprisoned by the mayor, but was immediately afterwards released on appealing to the lord president of the Council of Munster, who was personally acquainted with him. On his return to England, Penn and his father again quarrelled, because the conscience of the former would not allow him to take off his hat to anybody—not even to the king, the Duke of York, or the admiral himself. Penn was again turned out of doors by his disappointed and provoked parent. The mother, however, now interposed, and plead for her boy so far that he was allowed to return home, and the admiral even exerted his influence with the government to induce it to wink at his son's attendance at the illegal conventicles of the Quakers, which he would not give up. In 1668, however, he was thrown into the Tower, on account of a publication entitled *The Sandy Foundation Shaken*, in which he attacked the ordinary doctrine of the Trinity, and justification by the imputation of Christ's righteousness. While in prison he wrote the most famous and popular of his books, *No Cross, no Crown*, and *Innocency with her Open Face*, a vindication of himself, which contributed to his liberation, obtained through the interference of the Duke of York. In September,

1670, Admiral Penn died, leaving his son an estate of £1500 a year, together with claims upon government for £16,000. In 1671, the upright but incorrigible sectary was again committed to the Tower for preaching, and as he would not take an oath at his trial, he was sent to Newgate for six months. Here he wrote four treatises; one of them, entitled *The Great Cause of Liberty of Conscience*, is an admirable defence of the doctrine of toleration. After regaining his liberty he visited Holland and Germany, for the advancement of Quakerism, along with Fox and Barclay. The Countess Palatine Elizabeth, the granddaughter of James I., shewed him particular favour. On his return, he married, in the beginning of 1672, Gulielma Maria Springett, daughter of Sir William Springett, and for some years thereafter continued to disseminate, by preaching and writing, the doctrines of his sect. Having become a proprietor of part of New Jersey, and interested in its colonisation, he was induced, in 1681, to obtain from the crown, in lieu of his monetary claim upon it, a grant of the territory now forming the state of Pennsylvania. He proposed to call it Sylvania, on account of its forests; but the king (Charles II.) good-humouredly insisted on the prefix Penn. His comprehensive design was not only to afford an asylum for his religious brethren, but to establish a government adapted to his views and principles—'a civil society of men enjoying the highest possible degree of freedom and happiness.' With several friends, he sailed for the Delaware in August, 1682, was well received by the settlers, and on the 30th of November held his famous interview with the Indian tribes, under a large elm-tree at Shackamaxon, now Kensington. He next planned and named the city of Philadelphia, and for two years governed the colony in the wisest, most benevolent, and liberal manner. In his 'concessions' to the settlers of New Jersey, a portion of which was colonised by the leading Quakers of that period, the same attachment to the principles of civil and religious liberty was displayed, which he now exhibited upon a more extended scale in Pennsylvania, where his religious benevolence, genuine Christianity, and love of his race found open expression and practical enforcement. The charter of liberties followed, and the province of Pennsylvania set an example to sister states, showing how it is possible to enjoy one's own religious convictions without disturbing the peace and conscience of one's fellows. His colony became an asylum for the persecuted members of other sects besides the Quakers. Towards the end of the reign of Charles II., Penn returned to England to exert himself in favour of his persecuted brethren at home. His influence with James II.—an old friend of his father's—was so great, that many people, from that time to the present, have had doubts about the nature of their relations; but the suspicion that he allowed himself to be used as a tool by the court is really not justified by any known facts. His position may have seemed equivocal, but Lord Macaulay—who has urged the view of his complicity in some of the disgraceful incidents that followed Monmouth's rebellion with an ungracious animosity—has been convicted of haste and inaccuracy in several important particulars. At any rate, his exertions in favour of the Quakers were so far successful, that in 1686 a proclamation was issued to release all persons imprisoned on account of their religious opinions, and more than 1200 Quakers were set free. In the April following, James issued an edict for the repeal of all religious tests and penalties, but the mass of Nonconformists doubted his sincerity, and refused to avail themselves of it. After the accession of the Prince of Orange as William III., P. was twice accused of treason, and of corresponding with the exiled monarch, but was acquitted. In 1690 he was arrested on a charge of conspiracy, but was

again acquitted. Nevertheless, in the following year the charge was renewed. Nothing appears to have been done for some time, but Penn at last, through the kindly offices of his friends, Locke, Tillotson, and others, had the matter thoroughly investigated, and was finally and honourably acquitted, November, 1693. Shortly after, his wife died, but in less than two years he married again. His second wife, Hannah Callowhill, was a Bristol lady. In 1699 he paid a second visit to the New World, and found Pennsylvania in a prosperous condition. His stay, which lasted two years, was marked by many useful measures, and by efforts to ameliorate the condition both of the Indians and Negroes. Towards the end of 1701, Penn sailed for England, and found himself on his return virtually ruined by the villainy of his agent, Ford, with whom he had left the management of his affairs. When the rogue died, he left to his widow and son false claims against his master, and these were so ruthlessly pressed, that Penn allowed himself to be thrown into the Fleet in 1708, to avoid extortion. His friends afterwards procured his release, but not till his constitution was fatally impaired. Penn died at Ruscombe, in Berkshire, July 30, 1718. The character of William Penn, and his code of laws, have been the theme of eulogy. 'In the early constitutions of Pennsylvania are to be found the distinct announcement of every great principle; the germ, if not the development, of every valuable improvement in government or legislation which has been introduced into the political systems of modern epochs.'—T. I. Wharton, *Discourse before the Penn Society*, 1826. 'To William Penn belongs the distinction, destined to brighten as men advance in virtue, of first in human history establishing the *Law of Love* as a rule of conduct in the intercourse of nations.'—Chas. Sumner, *True Grandeur of Nations*, 1852. 'His name has become throughout all civilised nations a synonym for probity and philanthropy.'—Lord Macaulay, *History of England*. See Macaulay's *History of England*, vol. i.; Hepworth Dixon's *Life of Wm. Penn*; J. Paget's *Inquiry into the Evidence of the Charges brought by Lord Macaulay against William Penn*, Edin., 1858; S. M. Janney, *Life of W. Penn*, Philada.; Article *William Penn*, by J. Thomas, M.D., in *Lippincott's Biographical Dictionary*, Philada., 1870; and *Bibliography of the Penn-Macaulay Controversy*, in Allibone's *Dictionary of Authors*, Philada., 1870.

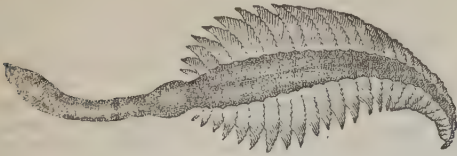

PE'NNALISM, the name given to a practice once prevalent in the Protestant universities of Germany, which seems to have been essentially the same as the Fagging (q. v.) of the English public schools. The freshmen or students of the first year (called *pennals*—i. e., *pen-cases*; fags) were considered by the elder students ('schorists') as virtually their servants. Whatever property the pennals had they must give up to the schorists, who now employed them in the meanest offices, made laughing-stocks of them, and beat and ill-used them—all which had to be endured without complaint. Pennalism is said to have been introduced in the beginning of the 17th century, and to have been mostly confined to the Protestant universities of Germany. But the germs and modifications of it were much earlier and more general, as is manifest from the prevalence of names of contempt for first year's students (see BEJAN), and from statutes passed by French universities as early as the middle of the 14th century, against levying payments for first footing from them. The servitude imposed on the pennals was probably an aping of the usage of chivalry, by which a candidate for knighthood had to serve for a time as page to one already a knight. All attempts to check the evils of pennalism were long unavailing, as the pennals took part with the schorists in resisting all regulations of the

authorities, which would have deprived them of the hope of exercising in their turn a like tyranny upon others. Edicts against the practice were issued in Jena and other universities about the beginning of the 17th c., but it was not till the last half of the century that the universities, by uniting in severe measures, were able to check the evil; and traces of it survived for a long time afterwards.—Schöttgen, *Historie des Pennalwesens* (Dresd. 1747).

PENNANT, THOMAS, LL.D., tourist, naturalist, and antiquary, was born June 14, 1726, at Downing, in Flintshire, and educated at Queen's and Oriel Colleges, Oxford. His first important publication was the *British Zoology* (1761—1769), which contained in all 132 plates on imperial paper, engraved by Mazel, and established his reputation. While the work was in course of publication, P. made a trip to the continent, and saw some of the scientific and literary celebrities of the time, as Buffon, who has favourably mentioned him in his great work on *Natural History*, Voltaire, Haller, the two Geoners, and Pallas. In 1769, he made the first of his famous tours in Scotland, penetrating to the remotest part of the country, which, he says, was then 'almost as little known as Kamtschatka.' He returned with a very good opinion of it, and published his report in 1771, in consequence of which (according to him) Scotland has 'ever since been *inondée* with southern visitants.' The year before, he added 103 plates to his *British Zoology*, with descriptive notices; and in 1771, printed at Chester his *Synopsis of Quadrupeds*, subsequently enlarged and improved under the title of *History of Quadrupeds*. Of this work Cuvier says: 'It is still indispensable to those who wish to study the history of quadrupeds.' In the same year the university of Oxford conferred on him the degree of LL.D. Next year he undertook his second and most important tour in Scotland, which included a voyage to the Hebrides (an account of which appeared in 3 vols. 1775). P. was warmly welcomed by the inhabitants. Almost every incorporated town paid him some formal compliment, and he returned 'rich in civic honour.' In 1773, he published his *Genera of Birds*, and made an antiquarian tour through the north of England. His subsequent tours through Wales do not require special notice. In 1777 appeared a fourth volume of his *British Zoology*, containing the Vermes, the Crustaceous and the Testaceous Animals of the Country. Among a great variety of later miscellaneous publications, we may mention in particular an amusing life of himself (*The Literary Life of the late Thomas Pennant, Esq.*, by himself, 1793). He died December 16, 1798.

PENNA'TULA, a genus of zoophytes (*Anthozoa*), allied to *Gorgonia* (q. v.) and *Alcyonium* (q. v.), and having very similar polypes; but the polype mass is not fixed by its base, has a fleshy stem strengthened by a bone, and a skin containing calcareous spiculæ, the upper part of the stem winged on two sides, with numerous pinnæ, along the upper margins of which the polype-cells are ranged. The whole form somewhat resembles a quill, so that the popular name SEA PEN is very often given to these zoophytes. One species, *P. phosphorea*, is common on the northern parts of the British coast. It is from two to four inches in length, of a purplish-red colour, and like many—perhaps all—of the other species, is sometimes brilliantly phosphorescent, emitting flashes of light when disturbed, but ceasing to be luminous on relapsing into quiescence. The stalk is hollow in the centre, and the bone which it contains—and which is composed of phosphate and carbonate of lime, like the bones of the vertebrate animals—is a very remarkable part of its

structure, not extending the whole length of the stalk, slender, straight, and perfectly simple, but bent backwards at each end into a hook. Other species are found in the Mediterranean and other seas, some of them more pen-like than even the British one.

Pennatula (Virgularia mirabilis).

Nearly allied to the pennatulæ is another genus of extremely beautiful zoophytes, *Virgularia*, ranked with them in the family *Pennatulidæ*, and sometimes receiving the popular name SEA RUSH. One species, *V. mirabilis*, is found on the British coasts.

PENNSYLVANIA, one of the thirteen original States of the United States of America, and the second in population, is situated between 39° 43' and 42° 15' N. lat. and 74° 42' and 80° 35' W. long., and is bounded on the N. by Lake Erie and N. York, E. by N. York and N. Jersey, from which it is separated by the river Delaware, S. by Delaware, Maryland, and W. Virginia, and W. by W. Virginia and Ohio. It is about 310 miles in length and 160 miles in breadth, is divided into 66 counties, and contains an area of 46,000 square miles, or 29,440,000 acres. P. is divided near the middle by the Alleghany Mountains into an eastern and western region. The first is drained by the Delaware, the Susquehanna, and their branches, whose waters flow into Delaware and Chesapeake Bays; the latter chiefly by the Alleghany and Monongahela, whose waters unite to form the Ohio. The average height of the rolling country west of the Alleghanies is 600 feet, and Lake Erie, on the north-west, is 565 feet above the sea. The Alleghanies are part of the great Appalachian chain, but in P. they seldom rise above 2000 feet in height. The Blue Ridge, known as the South Mountain in P., passes through the S. E. section of the State, and sometimes rises to the height of 1500 feet. P. is noted for her pastoral valleys of rare beauty, and for her picturesque streams and mountain gorges. The geology of the state has been ably developed by H. D. Rogers and J. P. Lesley, and therein has been found the key to the succession of strata in the eastern United States. The geological formations range from the Eozoic (Azoic), through the Silurian, Devonian, and Carboniferous, to the Triassic (New Red Sandstone), while the glacial drift is spread over the northern and western sections, and sends long tongues of gravel down the valleys almost to the southern limits of the State. The middle and eastern sections present numerous fertile limestone valleys, and near Philadelphia are quarries of white marble, and in Lehigh and York Counties valuable slates abound. The great deposits of anthracite and semi-anthracite lie east of the Alleghanies, and on the west are extensive beds of bituminous coal, salt wells, and the wonderful reservoirs of petroleum, which flows from the earth at the rate of about 20,000 barrels a day. Iron ore abounds in many parts, either as hematitic, magnetic, or fossiliferous, and nickel, copper, lead, and zinc are also mined.

The chief cities are Philadelphia (q. v.), distinguished for its manufactures; Pittsburg (q. v.), at the head of the Ohio, noted for its iron and glass products; Reading, on the Schuylkill, for its machinery; Williamsport, on the West Branch of the Susquehanna, the seat of one of the most extensive

lumber marts in the Union; Harrisburg, the political capital, Lancaster, Easton, and Erie.

The climate in the S. E. counties is generally mild, the mercury seldom falling below zero of F., or rising above 95°; but in the mountain valleys the winters are often severe. The soil is generally fertile, producing oats, maize, wheat, potatoes, rye, buckwheat, and hay. The product of maize per acre is often unsurpassed by any other State except those on the virgin soils of the North-west. While P. is one of the best agricultural states, a vast industry is also engaged in mining coal and iron ores, in manufacturing iron and steel, machinery, glass, woollens, and cotton—in the last two ranking next to Massachusetts, and in the former greatly surpassing any other State. The manufacturing establishments of P. in 1860 numbered 22,363, producing an annual value of \$290,121,188, and employing a capital of \$190,055,904. Her productive industry has probably trebled in value during the last decade. In 1869 and 1870 the mineral products reached an enormous amount. In 1869 there were mined 13,338,457 tons of anthracite, and 6,700,000 tons of bituminous coal, valued at \$90,000,000, and 4,215,000 barrels of petroleum, valued at \$50,000,000. The production of pig-iron was 950,000 tons, or 45 per cent. of the entire production of the Union; of rails, 319,653 tons, or 53 per cent. of the entire amount; of rolled iron, 260,000 tons, and of steel, 18,000 tons. In 1870 the anthracite product had increased to 15,849,899 tons, and the bituminous coal to 6,543,145, valued at \$100,000,000; petroleum, 5,659,000 barrels, five-sixths of the total American product, valued at \$56,590,000; pig-iron, 875,000 tons; rails, 325,000 tons; rolled iron, 245,000 tons; steel, 24,000 tons, a total value for iron and steel products (excluding machinery, tools, &c.) of \$70,000,000. In 1869 the agricultural products were valued at \$131,000,000, and in 1870 at \$150,000,000, while the manufactures of Philadelphia alone reached a total valuation of \$300,000,000, an aggregate of \$676,590,000. If to this be added the profits of her railroads and canals, and the numberless industries not here enumerated, a final aggregate would be reached of quite \$1,000,000,000.

P. has long been noted for her charitable institutions, for her admirable system of prison discipline, for her excellent roads, and for her gigantic system of canals and railroads, the latter constructed in advance of the time, but having been transferred by the State to private companies, now eminently prosperous. The Reading, Lehigh, and Lackawanna R. R. now carries the largest coal tonnage in the world, and a stream of oil flows through the State over the roads to Philadelphia and New York. There are 141 railroads, with a main-line extension of 4256 miles, which have cost about \$300,000,000, and pay a handsome profit upon their capital, and carried, in 1870, 26,491,949 passengers (exclusive of the city railroads, which conveyed upward of 60,000,000), and 53,439,789 tons of freight, on which a profit of \$34,138,195 was realized. One of these, the Pennsylvania, now controls 4000 miles, extending its Briarean arms from the Atlantic almost to the Pacific, forming the most gigantic corporation in the world. P. has 13 canals, 1068 miles in length, and wholly within the State.

Education has received enlarged attention in P., as is attested by her 34 colleges, 13 theological seminaries, 5 schools of medicine, 5 normal schools in operation and 4 in progress, 14,212 public schools, attended by 555,941 pupils, conducted by 17,612 teachers. The total cost of public education, in 1870, was \$7,771,761, of which \$3,745,415 was for tuition alone. There are also numerous private academies, 1400 public libraries, political, religious, literary, and scientific journals, nearly 6000 churches, 6 asylums for the insane, many hospitals, an institution for

deaf-mutes, 2 for the blind, 1 for the feeble-minded, 2 houses of refuge for juvenile delinquents, 2 State penitentiaries, and 18 soldiers' orphans' schools, with 3530 pupils, and numerous asylums and schools sustained by private munificence.

There were, in 1870, 50 banks (43 national), 15 savings banks, and 4 banks for deposit, 46 turnpike companies, 32 iron and steel companies, 15 coal and iron companies, 67 coal companies, 50 insurance companies, 76 oil companies, 42 incorporated manufacturing and 12 mining companies.

The expenditure of the commonwealth for the fiscal year ending November 30, 1870, was \$6,434,523, of which \$336,866 was for charitable institutions, \$508,245 for soldiers' orphans' schools, \$648,959 for public schools, \$1,789,522 for sinking fund, \$1,864,811 for interest on loans, and \$816,069 for the civil government. The revenue amounted to \$6,336,603. The assessed value of personal property was \$171,686,918, and the value of real and personal property, according to the census of 1870, was \$1,171,557,000. The public debt on Dec. 1, 1870, was \$31,111,662, against which the commonwealth held bonds of railroad and canal companies valued at \$11,254,32. \$1,702,879 of the public debt was paid during the year 1870.

In 1627 a colony of Swedes and Finns settled on the Delaware River. In 1681 the territory was granted by Charles II. to William Penn (q. v.), who, with his co-religionists of the Society of Friends (q. v.), established a Christian government 'founded on peace, reason, and right.' Having purchased the lands, &c., of the Indians, and conciliated them by kindness and good-will, he secured their friendship during 70 years. Some of the interior counties were settled by Germans and Scotch only, but the great body of the people are of English origin. New Jersey and Pennsylvania were the only colonies founded without bloodshed, and of which it may be truly said that the principle that neither priest nor magistrate has any jurisdiction over the conscience of men formed a fundamental provision of the constitution. Both colonies were under the control of Quaker proprietaries for a number of years, and their liberal political institutions have been a theme for eulogy by historians. The principles involved in Penn's code of laws were new in those days, but have since been adopted in the constitutions of many States, while in others they are still in advance of the age.

Population in 1820, 1,049,458; 1840, 1,724,033; 1860, 2,906,370; 1870, 3,521,951; 1880, 4,282,891.

See Taylor, R. C., *Statistics of Coal*, 2d ed., revised by S. S. Haldeman, Philada., 1855; Lesley, J. P., *Manual of Coal and its Topography*, Philada., 1856; Rogers, H. D., *Geology of Pennsylvania*, 2 vols. 4to, Philada., 1858; Lesley, J. P., *Iron Manufacturers' Guide*, New York, 1859; Henry, M. D., *History of the Lehigh Valley*, Easton, 1860; Daddow, S. H., and Bannan, B., *Coal, Iron and Oil*, Pottsville, 1866; and *First Annual Rep. of Commissioner of Public Charities*, Harrisburg, 1871.

PENNY, a British coin and money of account. The name is evidently the same as the German *pfennig*, and both words seem to be intimately connected with the old German *pfant*, a pledge, and the Latin *pendo*, to weigh or to pay. The penny is first mentioned in the laws of Ina, king of the West Saxons, about the close of the 7th century. It was at this time a silver coin, and weighed about 22½ troy grains, being thus about ⅓ of the Saxon pound weight. See MARK. Halfpence and farthings were not coined in England till the time of Edward I., but the practice previously prevailed of so deeply indenting the penny with a cross mark, that the coin could be easily broken into two or four parts as required. Silver farthings ceased to be coined under Edward VI., and silver halfpennies under the Commonwealth. By this time the penny had

steadily decreased in weight; it was 18 grains under Edward III., 15 and 12 under Edward IV., 8 under Edward VI., and under Elizabeth it was finally fixed at 7½ grains, or ⅓ of an ounce of silver, a value to which the subsequent copper pennies, which till 1860 were the circulating medium, closely approximated. In 1672 an authorised copper coinage was established, and halfpence and farthings were struck in copper. The penny was not introduced till 1797. The penny of the present bronze coinage is of only about half the value of the old copper penny.

PENOBSCOT, a river of Maine, U.S., rises near the centre of the state by two branches, from a chain of lakes extending north-westerly; and after a south by west course of 135 miles from the junction, or 275 in all, empties into Penobscot Bay, a broad and sheltered opening into the Atlantic Ocean, 20 miles wide, with several large islands. Its chief towns are Belfast, at its mouth; Bangor, 50 miles above, where falls supply power to saw-mills and factories; Castine, and Bucksport. It is navigable to Bangor, where there is a tide of 20 feet. The chief trade is pine timber.

PENRITH, a market town of Cumberland, in a picturesque and fertile valley, with rich and striking scenery in the vicinity, stands on the Carlisle and Lancaster Railway, 17 miles south-south-east of Carlisle. In the parish churchyard is a monument of great antiquity, formed of two pyramidal stones about 12 feet high, and known as the 'Giant's Grave.' The town contains an ancient free grammar-school, and other educational institutions. A new and beautiful church, built in the style of the 13th c., was consecrated here in 1850. Cotton, linen, and woollen goods are manufactured. Pop. 10,000.

PENRYN, a municipal and parliamentary borough and market town of England, in the county of Cornwall, in a warm, sheltered, and richly productive valley, on the Plymouth and Falmouth Railway, two miles west-north-west of Falmouth. It stands on a low hill projecting eastward into Falmouth Harbour. Trade is carried on to some extent with the mining district of Redruth, and there are several quarries in the vicinity, from which the famous P. granite—the material of which Waterloo Bridge, the Chatham Docks, and a great number of other important public works are constructed—is obtained: 20,000 tons of granite have been exported in the year, but the quantity varies much. Pop. (1871) of municipal borough 3679. Together with Falmouth, it forms a parliamentary borough, which returns two members to parliament, and the population of which, in 1871, was 16,819.

PENSACOLA, a town and port of entry, on a deep bay opening into the Gulf of Mexico, at the south-western extremity of West Florida, U.S. Lat. 30° 24' N., long. 87° 10' W. The town, nearly destroyed during the war in 1861, is on the north shore of the bay, and is connected by railway with Montgomery, Alabama. Near the entrance were the navy yard, hospital, and Fort Barrancas. The entrance is further defended by Fort Pickens, at the west end of Santa Rosa Island, and Fort M'Rae on the opposite point. The bay branches into two divisions, receiving the Escambia and Yellow Rivers. P. was settled by the Spaniards, occupied by the British in 1814, and acquired by the United States in 1821. Pop. (1870) 3347; (1880) 6845.

PENSION (Lat. *pensio*, from *pendo*, to weigh out, to pay), an allowance paid annually by government to an individual in consideration of past services, civil or military. See CIVIL LIST.

PENSIONS AND PENSIONERS, MILITARY AND NAVAL. There are pensions for good service

for mere faithful ordinary service, for wounds, and to representatives of deceased officers.

Good-Service Pensions are rewards to selected officers in the British navy for distinguished service. In 1873 they were as follow: 12 admirals have £300 each, 25 captains £150, 1 general of marines £300, 5 do. £200, 2 colonels £150, and 5 medical officers £100; the total charge being £9150. The corresponding pension in the army is called a **REWARD FOR DISTINGUISHED SERVICE** (q. v.).

The **Pensions for Long Service** are awarded in the army to non-commissioned officers and soldiers who have served 21 years in the infantry, or 24 years in the cavalry, or earlier if disabled from further service, according to the wounds, loss of health, and conduct of the pensioner. The amount is fixed by the commissioners of Chelsea Hospital, and varies from 1½d. to 3s. 6d. a day, the lower rates being mainly confined to negro pensioners from the West India regiments. Pensioners are either *in-pensioners* of Chelsea (q. v.) or Kilmainham Hospitals, in which case they forego their proper pension, and receive board, lodging, and a small sum for tobacco-money, or out-pensioners residing where they please, and drawing their pensions from the staff officers of pensioners, of whom there is one in every considerable town. These men can follow other pursuits, often do so with great success, as their military habits of regularity stand them in good stead in civil life. In particular, railways give employment to great numbers of pensioners, as signalmen, guards, &c. Pensioners who are in good health, and are willing for such service, are enrolled in a force called the 'Enrolled Pensioners,' which forms a defensive corps of veterans. This gives the men, as an adjunct to the pension, an annual retaining fee of £1 each, besides pay during the yearly training, of 8 days at the rate of 2s. a day for privates, 2s. 6d. for corporals, and 3s. for sergeants. The veterans are officered by their respective staff officers, and, in case of emergency, would be embodied for service. As garrison troops, these old soldiers would doubtless prove most valuable. A pension is forfeited if the holder be convicted of felony.

The **Naval Pensions for Long Service** are given to petty officers, seamen, and marines, under principles essentially similar to those for the army; the commissioners of Greenwich Hospital awarding the allowances, Greenwich Hospital being the home of the in-pensioner, and the out-pensioners drawing their pensions through the staff officers of military pensioners.

Under this section should be mentioned pensions for especial bravery in action, granted with the Victoria Cross (q. v.).

Pensions for **wounds** are common to both services, and are limited to officers. They are awarded respectively by the Secretary for War and Lords of the Admiralty, for serious bodily injury, as the loss of a limb or eye, and vary according to the rank of the recipient and other circumstances. In cases of less serious injury, temporary pensions are sometimes granted, or gratuities.

Widows of commissioners and warrant officers in the army and navy receive pensions so long as they remain unmarried, provided they have been married severally twelve months when their husbands die, and that the latter were under 60 years of age (50 for warrant officers) when they married the claimants. Such pension is not granted if the widow be left in wealthy circumstances, and lies dormant during a second marriage, though it may be revived should she again become a widow. The amount of pension varies according to rank, and there are three distinct classes for each rank: 1st, When the husband was killed in battle, or died within six

months of wounds received therein; 2d, When he died from some cause distinctly falling within the sphere of his duty, but not from wounds in action; 3d, When he died in the course of nature. The following table shows the amount of pension to widows of combatant ranks, civil ranks receiving similar rates according to relative standing. See **RELATIVE RANK.**

Widow of	PER ANNUM.		
	1st Class.	2d Class.	3d Class.
Flag Officer, or General Officer,	According to circumstances. £120		
Captains in Navy; Colonels in Army,	£200	{ 105 Cptsns. } { 150 Cols. }	80 & 70
Lieutenant-Colonels in Army,	200	140	80
Commanders in Navy; Majors in Army,	120	100	70
Lieutenants, Navy; Captains, Army,	80	65	50
Sub-Lieutenants, Navy; Lieutenants, Army,	60	50	40
Ensigns, Army, Gunners, Boatswains,	50	40	35
Carpenters, Navy,	35	30	25

Compassionate allowances are small additional pensions granted to the children of deceased officers, left in indifferent or bad circumstances. They vary from £5 to £40 each, and can be held by boys till 18 (unless earlier provided for), and by girls until 21, or an earlier marriage. If an officer fall in action, without leaving a widow or orphans, but leaving a parent who had been more or less dependent on him, such parent may be granted the pension or a portion of it, and is sometimes allowed to commute the pension into a single payment.

The **United States Pension** office was established temporarily in 1833, and continued by subsequent legislation until made permanent by act of January 19, 1849. It forms a Bureau in the Department of the Interior, and is under the charge of the Commissioner of Pensions. The only surviving revolutionary soldiers who received a pension died during the year ending June 30, 1867, but pensions were granted to two other veterans by acts passed in the same year. On the 30th of June, 1869, there were on the rolls 81,579 invalid military pensioners, whose yearly pensions amounted to \$7,362,804, and 103,546 widows and orphans, and dependent relatives of soldiers, whose yearly pensions amounted to \$13,567,679, making an aggregate of army pensioners of 185,125, and a total annual rate of \$20,930,483; the amount actually paid to invalid military pensioners and to widows and orphans was \$27,992,868.04. There were also 5280 invalid navy pensioners, to whom an annual pension was paid, amounting to \$118,171, and 1558 widows, orphans, &c., receiving an aggregate annual rate of \$256,830; the amount actually paid to navy invalids and to widows, orphans, &c., was \$430,016. The total amount paid in the year ending June 30, 1870, to pensioners of all classes was \$28,284,043, a sum less by \$409,781 than was paid in the previous year.

On June 30, 1870, there were 195,739 pensioners of all classes, or 10,614 more than on June 30, 1869.

Bounty Land.—During the year ending June 30, 1870, there were issued 1633 original land-warrants for 261,280 acres.

PENSIONARY, GRAND, OF HOLLAND. See **GRAND PENSIONARY.**

PENTACRINUS, a genus of *Echinodermata*, of the order or family *Crinoidea* (q. v.), remarkable as containing the only permanently stalked Crinoidea, or Crinoidea believed to be permanently stalked, known now to exist, and thus the only true living representative of the fossil Encrinetes (q. v.). The genus *P.* has a long pentangular column of numerous

joints, from which there arise at intervals many whorls of unbranched arms, and which bears at its summit a disc at first divided into five radiating members, and afterwards branching into ten arms, each further subdivided. The whole of this skeleton is calcareous, but it is united by cartilages, and covered with a fleshy integument. *P. Caput Medusæ*, the MEDUSA'S HEAD, is found in the West Indian seas, and is very rare in collections, being only dredged up from waters of considerable depth; from which cause also the nature of the base of the column is not certainly known. The stem is more than a foot long.—The fossil species of *P.* are numerous in the Lias and Oolite formations. They gradually become fewer in the newer rocks.—The stalked young of *Comatula rosacea* was at one time regarded as a *P.*, and described under the name of *P. Europeanus*. See CRINOIDEÆ.

PENTADESMA, a genus of trees of the natural order *Guttifera*, to which belongs the BUTTER-AND-TALLOW TREE of Sierra Leone, *P. butyragcea*. It is a tree sixty feet high, and produces a conical fruit of the size of a very large pear, the pulp of which abounds in a yellow oily substance, with a strong flavour, somewhat resembling that of turpentine, yet much used by the natives as an article of food. The 'country butter,' brought to the market of Freetown, is supposed to be procured from this fruit.

PENTASTYLE, a building with a portico of five columns.

PENTATEUCH (Gr. fivefold book), a name given by Greek translators to the five books ascribed to Moses, which are in Hebrew called collectively *Torah* (Law), by way of eminence, or *Chamisha Chumshe Torah* (five-fifths of the Torah). *Law* is also the general name by which the work or portions of it are referred to and quoted (the words 'of Moses' or 'of the Lord' being added occasionally) both in the Old and New Testament.

The division into five portions (further divided into 50, 40, 27, 36, 34 chapters, or 12, 11, 10, 10, 11 Parshioth or Sidras respectively, by the Masoretes) is, if not original, at all events of a very remote date, and certainly anterior to the Septuagint. Genesis, Leviticus, and Deuteronomy, the first, third, and fifth books, form clearly defined and internally complete parts of the work as a whole, and thus, also, fix the limits of the intermediate second (Exodus) and the commencement of the concluding fifth (Deuteronomy). The chief aim of the Pentateuch being to give a description of the origin and history of the Hebrew people up to the conquest of Canaan, together with the theocracy founded among them, the centre is formed by the person of Moses himself, the regenerator and lawgiver of the nation. Genesis, beginning with the history of the creation and antediluvian genealogy from Adam to Noah, in rapid outlines sketches the propagation of the various tribes that descended from the one man who was saved in the Deluge, but dwells with special emphasis upon Shem, from whom sprang, in the tenth generation, Abraham, the progenitor of the 'people of the covenant.' The salient events in the lives of his descendants, the Patriarchs, are minutely described; and a fitting close is found in the benediction of Jacob, who, as it were, reinaugurates and confirms all his twelve sons in the covenant made between Abraham and God. Exodus, treating of the liberation of the people from Egypt; their wanderings in the desert; the promulgation of the Law, by which they became emphatically the 'holy nation' and the 'people of the Lord' and the erection of a visible sanctuary may be regarded as the nucleus of

the work; while Leviticus, the following book, fittingly enters into the details of the legislation and the mode of worship; chiefly concerning the priests and Levites, the expositors of the Law, and, in a manner, the spiritual representatives of the other tribes. The historical thread is taken up again in Numbers, the fourth book, which, also, side by side with the relation of the events between the Sinaitic period and the beginning of the fortieth year after the Exodus, contains many laws explanatory of, or complementary to, those of the former books, together with such as new circumstances had called into existence. A brief recapitulation of the preceding portions; Moses's most impressive and reiterated exhortations to keep that Law, which was now completed, and solemnly transmitted to the Levites; and the death of the legislator himself; form the chief contents of the fifth book, or Deuteronomy. Thus, the theocratic plan of the work is carried through from beginning to end, coming out more prominently in the three intermediate books, but never lost sight of entirely. Nothing is dwelt or even touched upon save that which in some way illustrates either the relation of God to the people, or of the people to God; the political, civil, and domestic laws themselves, being enumerated only as bearing upon the main aim and object of the work.

The special books being treated separately under their respective heads, we have here only to consider some questions relating to the work as a whole, and principally that of its authorship and history, as far as these points have not been touched upon already under GENESIS. Tradition, as embodied in the earliest historical records, mentions Moses as the writer of the complete Pentateuch, such as it is before us: with the exception of a few verses, describing the last moments of the lawgiver, &c., which were ascribed to Joshua. This tradition has for many a long century been almost universally adhered to. Not that there have not at different periods suspicions been raised respecting this 'authenticity.' The Pseudo-Clementines, for instance, assumed that the Law, orally delivered by Moses to the Elders, had, before and after its being committed to writing, undergone innumerable changes, nay, corruptions; among these the too personal and human conceptions of God, and the unworthy traits recorded of the Patriarchs. Jerome expresses himself in a somewhat doubtful manner on the relation of Ezra as the 'redactor,' or rather 'restorer,' of the Pentateuch. Aben Ezra boldly calls several passages later interpolations, and speaks of others still more poignantly as a *Seod*, or a 'Mystery,' i. e., as containing difficulties not to be cleared away in consonance with the common belief, which he, however, was too pious wantonly to disturb. Other voices, vaguely lifted up by more or less competent scholars, remained unheard. It was not until long after the Reformation, at the dawn of the exegetical and critical modern age, that the question whether this codex was the work of one man, or even of one age, and what share, if any, Moses had in its composition, began to be discussed seriously and on scientific grounds. Hobbes held that the Pentateuch was rather a work on, than by Moses. Spinoza came to the conclusion, that it was to Ezra that we were indebted for the book in its present shape, and that it embodies certain genuine portions, collected at a late period, together with a vast amount of later material, added at various periods subsequent to the time of the supposed author. Vitranga, Le Clerc (Clericus), Rich., Simon, and others, followed, resuming and enlarging the discussion chiefly respecting the difficulties which presented themselves in the accounts of the creation, and the like, contained

In Genesis. The next, and indeed the most important step—because the one which at once removed the question from the field of hazy and timid speculations to that scientific basis upon which it still rests, was taken by Astruc, who, from the marked difference of the Divine names used in Genesis and the beginning of Exodus—noticed in the TALMUD and the FATHERS OF THE CHURCH—came to the conclusion, that these books had been worked up from different original documents, which he called Jehovistic and Elohistie respectively. See article GENESIS, where the development of this speculation is described. At the present stage of the investigation, the view very generally adopted is the 'complementary theory,' which assumes, with certainty, two or more authors—Jehovists and Elohistie—for the whole of the first four books, at least; the fifth being by some (Delitzsch, Schulz, Kurz, &c.) still ascribed chiefly to Moses's own hand. Only a small apologetic school, of which the chief spokesman is Hengstenberg, still upholds the entire integrity and authenticity of the work, pronouncing Moses its sole author. The contemporary discussions on these points, which, up to within a very recent period, were chiefly confined to Germany, have now also found their way into England. The impulse to the controversy in this country was principally given by Dr Davidson, the 'Essayists and Reviewers,' and Bishop Colenso, all of whom, on the basis of these German investigations, raised some new points. Innumerable replies, by more or less competent champions, have been issued; but as yet, so far from either of the combatants having declared themselves convinced by the arguments from the other side, the controversy elicits new publications uninterruptedly.

While endeavouring to trace, in the briefest of outlines, some of the chief objections raised against the Mosaic authorship, and the replies given thereto, we must remind the reader that ours is only the task of epitomisers, as it were, and that the very nature of our task precludes us from giving any opinion whatsoever about the superior force of the arguments on either side.

A work, alleged to be the production of one man, it is urged, first of all, ought to contain neither unnecessary repetitions of considerable length, nor contradictions, nor anachronisms. There ought to be a plan and a unity. Yet, there can be no doubt, they say, about the fragmentary character of the Pentateuch. Many portions, evidently complete in themselves, are strung together without the slightest logical sequence, nay, in an unchronological order. As to repetitions and contradictions, there is, to begin with, the very history of the creation, which occurs twice in the first chapters of Genesis, is each time given differently, and in each account the Divine name is consistently mentioned in a different way. The same is to be said with regard to the account of the Deluge, and several incidents in the lives of the Patriarchs; the important conversation between God and Moses respecting Aaron (Exod. iv. 10–16, and vi. 9); the descriptions of the tabernacle; the priestly vestments; the story of the manna as given in Exodus and Numbers; the account of the appointment of the council of the 70 elders in the same books; &c. Again, the work itself sometimes seems to indicate an author who is not the legislator himself, such as the phrase of Moses being the humblest of men; the account of his own death; the passage in Genesis 'before there reigned any king over the children of Israel' (xxxvi. 31); the occurrence of the name of the city of Dan (Gen. xiv. 14, Dent. xxxiv. 1), so called only after the conquest by that tribe. In Numb. xxxii. 34 again, we have an enumeration of a certain

number of towns and villages built by the tribes of Gad and Reuben—an event which could not have happened during Moses's lifetime; further, the frequent occurrence of the formula 'unto this day' (e. g., Deut. x. 8, where the author speaks of the institution of the Levites as being still in force 'up to this day'), &c. It is contended, also, that the language of the Pentateuch varies very little from that of the last prophets, and that it can hardly be assumed that a thousand years should have made no perceptible difference in the idiom; more particularly has Deuteronomy been supposed to bear a striking resemblance, in style and language, to Jeremiah. The Pentateuch is further said to contain many facts palpably contradictory to natural laws, as they are established in the experience of the whole historical human race, and systematised by science.

Of the many ways to get rid of these and similar—old and new—exceptions, the most generally adopted is that which we mentioned as the method of 'interpolation,' by which the Apologetic School strikes out some fifty or more passages, as not belonging to the original work, but having crept in, by way of commentary, note, or explanation, in post-Mosaic times—the body of the work being thus saved, so to say, by a most extensive amputation. As to the argument from the language, it is said that the Pentateuch, being the divine book, by way of eminence, and embodying the very phrases (to the letter) made use of by the Almighty, must needs have served as a model for the next thousand years, and priests and Levites, the teachers of the people, were enjoined constantly to study and read it: hence the small difference in the later writers. Arabic and Syriac, it is argued, did likewise not change essentially for many centuries—an assertion, however, which only holds good if 'many' is taken in a very vague sense indeed. That Deuteronomy differs in style and manner, is verbose, &c., is explained by Moses's advanced age. On the other hand, events which are not in harmony with the 'natural laws,' are accepted by the orthodox simply and literally as 'miracles,' while 'conservative' rationalists of the school of Eichhorn, Rosenmüller, and others, who stand by the authenticity of the Pentateuch, have been at great pains to find some kind of poetical interpretation for them.

The most recent attacks on the authenticity are chiefly founded upon arithmetical grounds. The numbers of the people, their cattle, and the like, at various periods, do not seem to conform to the laws of natural increase, or even to the geometrical limits within which they were at times stated to have been confined. Among the direct proofs, however, proffered by the defenders of the authenticity, the following chiefly deserve attention. Deuteronomy, it is averred, can only be the work of Moses. He speaks in it to the men whom he has led for many years, as one who has lived through all the events himself. There is no possibility of any one imitating the local colouring in such a manner. If, then, Deuteronomy must be allowed to be the work of Moses, the three preceding books, to the contents of which frequent allusion is made, must equally be supposed to be finally redacted, if not written, by the same hand; and it further follows naturally, that the introduction to these books, which is Genesis, must have emanated from it. Again, any one writing after Moses, could not possibly have possessed the extraordinarily correct knowledge of contemporary Egypt and Arabia, which appears throughout the Pentateuch. A writer who might be supposed to have acquired it by dint of study of antiquities, must, it is said, have betrayed himself on every page by inaccuracies and

anachronisms. Nineveh is in Genesis a city of as yet little importance; while Resen, of which no trace is to be found in any other part of the Bible, is the great metropolis of Assyria of the time. Tyre, great in the days of David, and mentioned already in Joshua, is not to be met with in the Pentateuch, where a later writer would certainly have spoken of it in connection with Sidon. The Canaanite gods and altars are often spoken of; never their temples, of which yet we read in Joshua. Why, then, should that very ancient author, to whom must needs be traced the Pentateuch, not be Moses himself, rather than some contemporary of his? The fragmentary, abrupt, and, as it were, confused character of the work, the apologists further urge, so far from testifying against Moses, confirm the tradition of his authorship. Would not a later historian have worked the mixed mass of historical, geographical, legal, and personal material into a methodical and systematical whole? Who else could have imparted to the book the impress of a diary, so to say, but the man who was in the midst of the events, jotting down all the items important either in his own individual or the national career? And who but one standing in its very centre could depict with such glowing colours the life that moved around him?—But a further direct argument for the authenticity is found by them in the very item of the language of the Pentateuch. True, they say, it resembles as much as can be that of the later books, because, as we said before, it remained the classical language for all later generations; but, on the other hand, it offers certain peculiarities—such as the use of a common pronoun of the third person singular for both the masculine and feminine genders; the same term for boy and girl; and the like archaisms—all of which distinctly prove it to be a work of a very much older date. The existence of an ancient Mosaic code of laws would further appear proved beyond any doubt by the constant recurrence of quotations from ‘the Law of Jehovah’ or ‘the Law of Moses’ throughout the other books of the Old Testament from Joshua to Hosea. Had there in reality been no such code in existence, the authors of the different biblical works could not possibly have so unanimously spoken of it without betraying a conscious forgery somewhere. That Ezra should have been the author, or, at all events, the refounder of the Pentateuch, is equally improbable, on account of the spirit, tone, language, and all those smaller peculiarities of which mention has been made; and he would, on the other hand, never have been able so skillfully to avoid his own individual manner and style, as it appears in his own book. The Samaritan P., it is further said, which, with a very few characteristic alterations, is an accurate transcript of our Pentateuch, would have been an utter impossibility, considering the hostile relations between the Samaritans and the Jews, if it had not been well known as a genuine document before the division of the empire. That Hilkiah, who is said to have found the Book of the Law in the temple in the days of Josiah (2 Kings, xxii.; 2 Chron. xxxiv.) should have been its real author—an opinion first advanced by De Wette—would imply a complicity in the forgery not only on the part of Jeremiah, Huldah, and the elders, but almost of the whole people, among whom, on the contrary, there certainly seems to have been living a very vivid tradition of the former existence of the book or some of its portions at least. Moreover, had it been first written in those days, there surely would have been introduced some kind of prophetic allusion to the royal house of David, or, at all events, a pedigree and origin differing from the incestuous

one given in Gen. xxxviii. Deuteronomy would altogether have changed its language about Royalty (xvii. 15–20) very considerably; and Joseph’s would not have stood out so prominently as a favoured tribe. The alleged difficulties respecting the numbers are explained away more or less convincingly—in the most difficult cases, by miraculous interference. Corruptions, interpolations, and the many fates that befall ancient documents, are allowed to have crept in, in some places; although this argument is given up by those who hold that a special providence watched over the divine work. In all other respects, they hold these books are exactly as they were written by Moses under direct ‘Inspiration.’—Thus far, in swiftest outlines, the pros and contras most commonly adduced, and worthy of some consideration.

A few rationalistic critics, however, have gone so far as to deny the very possibility of Moses having given the laws contained in the Pentateuch, chiefly founding their objections upon the ground that he was not likely to have been versed in the art of writing to an extent which the composition of these laws would presuppose. Egyptian characters, with which he might have been familiar, could not have been used for Hebrew composition; and the Hebrews themselves, uncultivated as they were, did not possess any characters of their own. There has only, in reply to these objections, that fact to be stated, that a soberer criticism of more recent date has found itself obliged, in deference to certain paleographical and other scientific truths, to give up most of these points, or, at all events, to found no such sweeping condemnation upon those which still remain. On the contrary, whichever of the hypotheses enumerated at the beginning is assumed, the groundwork of the legislation is traced back, by almost unanimous consent, to the historical person of Moses, who is no longer the mythical demigod of barbarous hordes, but a man, such as we have endeavoured to sketch under that head. The final redaction of these laws, however, as of the whole of the Pentateuch, is almost as unanimously—more especially by German critics—placed in ages long after him.

In the contemporary ‘moderate’ school in England, so far as we have been able to glean from their writings, the following seems to be the prevalent opinion on the point of the Mosaic authorship: It is allowed, that Moses did not write the whole of the Pentateuch, but portions of Exodus, Leviticus, and Numbers, and the whole of Deuteronomy, with the exception of the account of his death, and such portions as palpably shew an author who points to the imminent dissolution of the empire. That even the fundamental Law (Decalogue) should be found in two varying versions, they hold, strengthens rather the assumption of their genuine Mosaic authorship in some original shape. The later editor, finding two different recensions made by contemporaries, or in subsequent ages, embodied them both, on account of their paramount importance, literally. Genesis was worked up from ancient documents, composed by various writers, living at various ‘prehistoric’ periods, either by Moses himself, or under his supervision, by some of the elders. The first redaction of the five books as a whole took place after the conquest of Canaan, through Joshua and the elders; the second and final redaction, however, in which it received its present shape, is to be dated from the time of Ezra, after the return from the exile.

The majority of continental modern critics of the more moderate stamp—who repudiate the notion of their belonging to the advanced rationalistic party—hold opinions of a very different kind; and since they have found professed partisans in England, the

foremost of whom is Dr Davidson, we will make use of his own words (*Introduction to the Old Testament*): 'There is little external evidence for the Mosaic authorship; and what little there is, does not stand the test of criticism. The succeeding writers of the Old Testament do not confirm it. The venerable authority of Christ himself has no proper bearing on the question. The objections derived from internal structure are conclusive against the Mosaic authorship. Various contradictions are irreconcilable. The traces of a later date are convincing. The narratives of the Pentateuch are usually trustworthy, though partly mythical and legendary. The miracles recorded were the exaggerations of a later age. The voice of God cannot, without profanity, be said to have externally uttered all the precepts attributed to him. Moses's hand laid the foundation of the edifice of God's word, which has grown into the proportions in which we now possess it; but he was not the first writer who penned parts of the national legends and history. He was emphatically a *lawgiver*, not a historian, a grand spiritual actor in the life-drama of the Israelites, who founded their theocratic constitution under the direct guidance of the Supreme.'

A few words must be added respecting the use of the Pentateuch. According to Deut. xxxi. 24 seqq., it was preserved in the Ark of the Covenant. Every seventh year, it had to be read to the people in public; and probably the Schools of Prophets, instituted at the time of Samuel, propagated its use by copies. Moreover, certain priestly, sanitary, and other laws required constant reference to it, so that certain portions of it seem to have been widely in use at an early period. Every synagogue is, according to the traditional Law, to possess a roll of the Torah, written on parchment, and under certain strictly-insisted-upon regulations, out of which roll certain portions are read on Sabbath and feast-days; and, according to the ancient custom in Palestine, when Monday and Thursday were the market-days—when the country-people came to town and the judges sat—also on those days. A smaller portion (Parasha) is read on these and on the afternoon service of the Sabbath than on the Sabbath morning service, when a whole Sidra is read, or rather chanted, according to the *Neginah*, which is note and accent at the same time. The Samaritans have, of all biblical books, only adopted the Pentateuch, with slight variations (see SAMARITANS), their Book of Joshua being a very different work from ours; and certain very recent accounts of their possessing also other adaptations of our biblical books, require confirmation. For the different translations of the Pentateuch, ancient and modern, see VERSIONS. The first printed edition of the Pentateuch dates Bologna, 1482, fol. The name of commentators and writers on the whole of the Pentateuch, both in and out of the Church, is legion. We mention among the foremost, besides the Church Fathers (Augustine, Jerome, Ephraim, Syrus, &c.) and the medieval Jewish commentators (Raspi, D. Kimchi, Aben Ezra), Calvin, Luther, Grotius, Le Clerc, Spence, Michaelis, Eichhorn, Jahn, De Wette, Keil, Hävernick, Bleek, Hengstenberg, Ranke, Kurtz, Stähelin, Bertheau, Colenso, Graves, Stuart, Bush, &c.

PENTECOST (Gr. *pentecostē*, fiftieth) was the name given to the feast among the Jews, held on the fiftieth day after the passover, in celebration of the 'ingathering,' and in thanksgiving for the harvest. See FESTIVALS. From the Jewish use it was introduced into the Christian, and with special solemnity, as being the day of the descent of the Holy Ghost on the apostles, and of the first solemn reaching of the Christian religion. From early

times, pentecost has been regarded as one of the great festivals of the Christian year, and it was chosen as one of the times for the solemn administration of baptism; and the English name of the festival, *Whit-Sunday*, is derived from the *whites* robes in which the newly-baptised were clad. It is regarded as specially sacred to the Third Person of the Blessed Trinity, to whose honour the services of the day are directly addressed. Many curious usages were anciently connected with the celebration. The dove, being held as an emblem of the Holy Ghost in some churches, a figure of a dove, suspended by a cord from the ceiling, was lowered so as to alight on the high altar during the service. In others, figures of cloven tongues, or red rose-leaves, were similarly introduced. The latter practice is said to be still retained at Messina, but in general these scenical representations have been discontinued. In some places, however, in the East as well as in the West, the practice prevails of decorating the churches with evergreens and flowers, as is done in England at Christmas. The whole time intervening between Easter and Pentecost is celebrated in the Roman Catholic church with special solemnity, and with some peculiar usages, and of this something is retained in the Church of England.

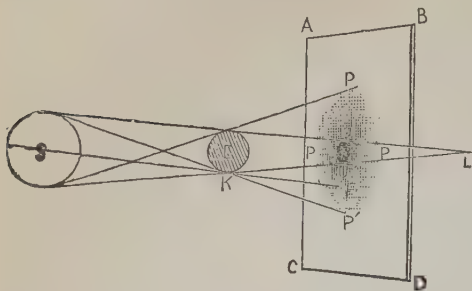

PENTHOUSE, a projection forming an open roof or shed, protecting a doorway, gate, window, &c.

PE'NTLAND FIRTH, a channel or strait between the Atlantic and German Oceans, separating the mainland of Scotland from the Orkney Islands. It is 17 miles long, and from 6 to 8 miles wide. About a mile west of Duncansbay Head is a ferry station, whence boats cross to Burwick, in the island of South Ronaldshay, a distance of 7 miles. The Pentland Skerries, 5 miles north-east of Duncansbay Head, consist of two islets, and of several contiguous rocks. On the larger of the islets is a light-house with two lights, one of which is 170, and the other 140 feet above sea-level. The lat. of the light-house is 58° 41' N., long. 2° 55' W. Off the coast of Caithness, and separated from it by a channel called the Inner Sound (about 2 miles in width), is the island of Stroma; and 3 miles north-north-east of Stroma is the islet of Swona, one of the Orkneys. On the north side of Stroma is the small vortex or whirlpool of Swalchie, and west of it are the breakers called the 'Men of Mey,' which are supposed to be produced by a current setting strongly on a concealed reef. The navigation of the P. F. is more dangerous than that of any other portion of the Scottish seas. A current setting from west to east flows through the Firth with a velocity of from 3 to 9 miles an hour, and causes numerous eddies and whirlpools. It is estimated that about 4000 vessels with cargoes pass through the Firth annually.

PENTLAND HILLS, in the Lowlands of Scotland, extend north-east from the border of Lanarkshire to the centre of the county of Edinburgh, and to within 4 miles of the city of that name. Mean height upwards of 1000 feet; highest summit, East Cairn, near the middle of the range, 1839 feet.

PENUMBRA. When the shadow of an opaque object is thrown upon a surface at some little distance by a light of considerable apparent size, it is observed that the shadow is divided into two portions, a dark portion in the centre, and a lighter portion surrounding it. The former is known as the *umbra*, or complete shadow; the latter as the *penumbra*, or partial shadow. A reference to the

figure will at once make plain their origin and relation; for if *S* be the illuminating body, *E* the object whose shadow is cast on the surface,

ABCD, it is seen that the small portion, *uv*, receives (omitting all consideration of refraction, dispersion, &c., of light) no light from *S*, while the whole surface outside of *PPPP'* is completely illuminated. The point *P'* receives light from the whole of *S*; the point *F* is only half illuminated, and that by the lower part of *S*, the illumination of the points becoming less and less as they approach *u'*, which is unilluminated. The portion within *uv'* is the umbra, and that between the boundaries *PPPP'* and *uv'* is the penumbra, which, as we have seen, gradually shades from perfect light at the outer boundary to perfect darkness at the inner, so that it is almost impossible exactly to note its limits on either side. This phenomenon, it is evident, can only occur when the illuminating body is of such a size, real or apparent, as to make the angle, *P'Ku'*, of sensible magnitude; and it is equally evident that the nearer the body *E* approaches the plane on which its shadow is cast, the larger is the umbra and the smaller the penumbra; while by increasing the distance between *E* and the plane, so that the point *L* shall fall between them, the umbra is made to vanish, and the penumbra is increased. This is well illustrated by natural phenomena: the shadow of a man cast by the sun on the ground presents almost no penumbra; the shadow of the earth thrown by the sun upon space at the distance of the moon gives a penumbra many times as large as the umbra; and sometimes, when the moon is new at her apogee, for instance, her shadow cast upon the earth exhibits no umbra. Spectators on the earth who see a partial eclipse of the sun, are situated within the penumbra, but within the umbra when they observe a total eclipse; while if the eclipse be annular, the umbra does not exist in the shadow cast by the moon on the earth's surface. See ECLIPSES.

PE'NZÁ, a central government of European Russia, between the government of Nijni-Novgorod on the north and that of Tambov on the west. Area, 14,615 square miles, pop. 1,197,393. The surface is in extensive and elevated plains, marked occasionally with ridges of low hills. The rivers are tributaries of the Don and Volga, and three of them, the Khoper, the Soura, and the Moksha, are navigable. The climate, though rather cold in winter, is temperate, agreeable, and healthy. The soil, consisting, for the most part, of black earth, is extremely fertile, and agriculture is the principal employment of the inhabitants. Grain of different kinds, leguminous plants, beet-root, flax, hemp, tobacco, and hops are the principal products. Much of the grain is used in the numerous distilleries, and considerable quantities of it are exported to the neighbouring governments. About one-third of the entire area is covered with forests, some of

which consist entirely of oak-trees. The manufactories are centred chiefly in the towns; cloth and leather are the principal articles made. The commercial improvement of the government is hindered by the want of direct means of communication with the consuming districts. The principal towns are Penza, Mokshansk, and Saransk.

PENZA, a town of European Russia, capital of the government of the same name, on the Soura, 220 miles south-south-east of Nijni-Novgorod. It was founded in the middle of the 17th c., as a defence against Tartar invasion, is a handsome town, occupying an elevation, and containing 19 churches, 2 convents, many gardens, a large park, with a beautiful fruit-garden and a horticultural school. It possesses 2 cloth-factories, 4 iron-works, several soap-boiling and candle-making establishments. The principal articles of commerce are corn and timber, which is floated down the Soura during spring. Pop. 27,799.

PENZA'NCE, a market and sea-port town, and a municipal borough of England, in the county of Cornwall, stands on the north-west shore of Mount's Bay, 22 miles west-south-west of Falmouth. It is the most westerly town in England—the light-house on its pier being in lat. 50° 7' N., and in long. 5° 28' W. The town, standing on a finely-curved shore, surrounded by rocky eminences, and in a fertile district, is exceedingly picturesque in situation, and is famous for its mild, though somewhat moist climate. Its esplanade, one of the finest in the west of England, commands charming land and sea views. The chief buildings, most of which are constructed of granite, are the town-hall and corn-market, surmounted by a dome, and the chapels of St Paul and St Mary. There are numerous boarding-houses for the accommodation of the visitors, attracted hither by the temperate and equable climate, by the beauty of the neighbouring scenery, and the curiosities of the district of Land's End. Woollen yarns and cloths are manufactured; the fishery employs upwards of 2000 persons; agricultural produce, pilchards, and tin and copper ores produced from the mines of the vicinity are exported; and timber, iron, hemp, and hides are the chief imports. The harbour is accessible for vessels of considerable burden, and is furnished with a pier 800 feet in length. In 1872, 859 vessels, of 73,689 tons, entered, and 369, tonnage 28,211, cleared, the port. Pop. (1881) of municipal borough, 11,684.

P. was laid in ashes by a party of marauding Spaniards in 1595, and was sacked by Fairfax in 1646.

PE'ON. See CALOPHYLLUM.

PEO'RIA, a beautiful and flourishing city in Illinois, U. S., on the west bank of the Illinois River, which is crossed by two bridges of 2500 feet, at the outlet of Peoria Lake, 70 miles north of Springfield, and 151 miles south-west of Chicago. It is connected by steamboat navigation with the Ohio and Mississippi, by canal with Lake Michigan, and is an important station on the great network of western railways, Bluffs of bituminous coal, opening upon the river banks, supply numerous manufactories. There are 24 churches, and numerous schools and public institutions. Pop. (1860) 14,025; (1880) 29,259.

PEPÉ. Three Neapolitans of this name have played an important part in history. The first of these was GABRIELE PEPE, who was born in 1781 at Bojano, in the present province of Campobasso, Italy, and was a student of law in 1799, when, on the proclamation of the Parthenopean Republic, he took service in the Franco-Neapolitan army, and was consequently exiled on the fall of

the new government. Subsequently he served in the Italian legion in the French army under King Joseph in Spain with great distinction, and with Murat. In 1815, he was raised by the latter to the rank of colonel, a grade confirmed by Ferdinand I., who gave him the command of a province, and afterwards of the garrison of Syracuse. He espoused with great zeal the cause of the revolutionary party in 1820, and was deputed to the national parliament. On the downfall of the constitutional government, he was seized by the Austrians, and imprisoned at Olmutz, in Moravia; but was released at the end of two years, and retired to Tuscany; where, feeling hurt at some remarks of M. de Lamartine, then charge-d'affaires in that country, on Italian patriotism, he in turn wielded the pen in defence of his countrymen with such severity that a duel resulted between him and the poet, followed by an apology from the latter. From this time he took no part in political affairs, but devoted himself to science and literature, and died at Bojano, August 1849.—His cousin, GUGLIELMO PEPE, born in 1782 at Squillace, was a man of equal note. After serving in the French army of Catalonia, and attaining to high rank and honour, he returned to Naples to support Murat; and after the flight of that chief, was one of the leaders of the 'Muratist' party, yet, after the restoration, the Bourbon Ferdinand allowed him to retain his honours. P. rendered valuable services in rooting out (1818) the nests of brigands who infested the provinces of Avellino and Foggia, and after the insurrection of 1820, was for some months the most influential man in Naples; but, after his defeat by the Austrians at Rieti, 7th March, 1821, he was forced to flee the country, and took refuge in Spain, whence he retired to England, where he lived many years, afterwards removing to Paris. In 1848, on the proclamation of an armistice, he returned to Naples, welcomed with enthusiasm by the people and the court; and the king, constrained by the public voice, gave him the command of the Neapolitan contingent which was sent to aid the Lombards against Austria; but after the suppression of revolution in Naples (15th May), P. was ordered to return and put down the insurgents of Calabria. Disregarding these orders, P., with as many of the Neapolitans as would adhere to him (2000 men), devoted his energies to the defence of Venice, of whose army he had been elected commander-in-chief. His prudence and courage, joined to an untiring energy, enabled him greatly to retard the operations of the Austrians; but the force under his command was ill suited for effecting anything of importance. His most remarkable exploit was the sortie he effected in person (October 1849) from the citadel of Marghera. After the fall of Venice, P. fled to Corfu on board a French ship, and subsequently returned to Paris. He had, however, an antipathy to France, and speedily removed to Turin, where he died 9th August 1855. He has left several works, the chief of which are, *Relation des Evénements Politiques et Militaires de Naples en 1820 et 1821* (Paris, 1822, in Italian and French), and *Histoire des Révolutions et des Guerres d'Italie en 1847, 1848, et 1849* (Paris, 1850). A statue of him has been erected in Turin.—His elder brother, FIORENTINO P. (born 1780, died 1851), was also a Muratist, but submitted to Ferdinand. He was a mild and conciliatory, but feeble liberal.

PEPERINO, an Italian term, applied by some geologists to the brown volcanic tuffs derived from augitic rocks, to distinguish them from the ordinary tufas, which name they confine to the lighter-coloured pumiceous rocks that have more trachyte in their composition.

PEPIN, the name of several distinguished members of the Carolingian family; the first of whom in order was *PEPIN LE VIEUX* or *PEPIN DE LANDEN*, the founder of the family. He was of a Brabant family, and took his designation from Landen (now in Liege, Belgium). Rebelling with others of the great lords of Austrasia against the rule of Brunehaut, who was regent for the youthful king, he offered the crown to Clotaire II., king of Neustria, who, in reward of his services, created P. *maire du palais* of Austrasia, an office which he continued to hold during the two following reigns, and died in 639. His administration was directed to the preservation of the power and integrity of the Austrasian kingdom, and though, by opposing the various schemes of centralisation proposed by the king, he fell under the royal displeasure, his conduct gained for him favour and influence with the Austrasian chiefs; his power and wealth were greatly increased, and a broad and firm path to political supremacy laid for his descendants. His son, Grimoald, who succeeded him as *maire du palais*, incautiously attempted to gather the fruits of his father's schemes before they were quite ripe, and accordingly suffered for his folly. Both he and his son Childebart were strangled in prison (656) by order of Clovis II. Pepin 'the Old' left by his daughter a grandson, *PEPIN LE GROS* or *PEPIN D'HERISTAL*, who was elected by the Austrasian nobility as their chief, to protect Austrasia against the machinations of Elroin, the able *maire* of Neustria. His first step was to rid himself of the Merovingian king, who nominally ruled over Austrasia; which was effected by obtaining the condemnation of the unfortunate monarch, Dagobert II., by a council of bishops, and then putting him to death. From this time the Merovingian rule in Austrasia ceased. P. was now sole ruler, but his ambition did not stop here; he had resolved on the ruin of the Merovingian monarchs, and accordingly levied a large army for the invasion of Neustria. Elroin, on his side, was equally resolved to humble the territorial aristocracy, and support the throne; and advancing into Austrasia, his army came in sight of P.'s at Loix. In the battle (680) which ensued, P.'s army was totally defeated, his brother and co-ruler, Martin, was taken prisoner and put to death, and he himself narrowly escaped. Luckily for him, however, Elroin was soon afterwards assassinated, and his successor, Warat, signed a treaty of peace. The incapacity and tyranny of Warat and his successor, Berthaire, discontented the Neustrian nobles, who went over to P., and by this accession of power enabled him to resume the offensive. Neustria was immediately invaded, and a bloody but decisive battle at Testry (687) freed P. of his opponent Berthaire, who was left dead on the field, and placed Neustria at his feet. Full of moderation in the midst of triumph, and satisfied that he could not place on the throne a more obedient slave than Thierry III., the then king of Neustria, P. caused him to be also proclaimed king of Austrasia, but reserved for himself the sovereign power, wielding the sceptre though declining the crown. From this time he ruled the whole of France (Austrasia in his own right by his election as Duke, and Neustria as *maire du palais*) with energy, and undisturbed by any internal commotion, during the lives of three other 'faineant' kings, till his death in 714. He had made several campaigns (689—708) against the Frisians, but that valiant and independent race was not thoroughly subdued for some time afterwards. P. had two legitimate sons who died before him, and an illegitimate son, Charles, subsequently known as Charles Martel (q. v.), who succeeded to his power.—The third who bore this name was *PEPIN LE BREF*, the

younger son of Charles Martel, who, on the death of his father in 741, received Neustria and Burgundy; Austrasia, Thuringia, and Suabia being the heritage of his elder brother Carloman. Aquitaine was nominally a part of P.'s dominions, though, as it was really independent under its own duke, he made several attempts to subdue it; but the duke was quite able to hold his own against both P. on the one hand and the Arabs (from Spain) on the other. The farce of governing the country in the name and as the chief minister of the Merovingian sovereign was still kept up, though P. was eagerly longing for an opportunity to assume the crown; but the present time was inopportune, as no sooner was the restraint of Charles Martel's iron hand removed by death, than revolts broke out in all quarters among the Franks, Germans, Bavarians, and Gascons. The country, by the united exertions of P. and Carloman, was restored to tranquillity about 745. Those princes who had excited the insurrection were mostly deposed, and otherwise punished, and the Duke of Aquitaine was compelled to acknowledge at least the nominal sovereignty of Pepin. In 747, Carloman bade adieu to power, and retired into a convent, leaving his government to his sons, who were immediately dispossessed by Pepin. After crushing a rebellion of Saxons and Bavarians, P. began to carry out his favourite project of dispossessing the Merovingian dynasty of even the semblance of authority, and of originating in person a new royal dynasty. To gain his point he flattered the clergy, then the most influential body in France; and as they had been despoiled by Charles Martel for the behoof of his warriors, a moderate degree of kindness and generosity on the part of P. contrasted him so favourably with his father, that the clergy at once became his partisans. So did the pope, who felt the importance of securing the aid of the powerful Frankish chief against the Lombards, who were then masters of Italy, and released the Franks from their oath of fidelity to Childeric, the Merovingian monarch. On learning this, P. at once caused himself to be elected king by the assembly of estates at Soissons, and was consecrated by the Bishop of Mayence (March 752). Childeric retired to a convent, where he died in 755. P. was the first Frankish monarch whose election received the sanction of the pope, and who was consecrated to his high dignity; and these solemn ceremonies put the crown to a great extent at the mercy of the clergy, who from this time took a political rank in the state. The practice, too, followed by P. and his predecessors in office, of gaining partisans by granting particular fiefs to various chiefs, greatly strengthened the feudal system, and proportionally weakened the royal power. This effect, however, did not shew itself till after the subsequent reign of Charlemagne, on account of the personal genius of these two rulers. P. was soon called upon to aid the pope against the Lombards, and marching into Italy at the head of a large army, he compelled Astulf, the Lombard king, to retire from the siege of Rome, and restore several cities which had previously belonged to the Greeks; these were now handed over to the pope. He had hardly returned to France, when he was anew summoned (755) to Italy, the Lombards having broken their engagements. This time he took Ravenna, Emilia, the Pentapolis, and the duchy of Rome from the Lombards, reuniting them to the Holy See. After the settlement of affairs in Italy, the turbulent nations on his eastern frontier demanded his attention. The Saxons and other German tribes were defeated (757), their country cruelly ravaged, a heavy tribute exacted, and numbers of captives and hostages taken. Resolved to unite the whole of Gaul under his authority, he

eagerly accepted the invitation of the Visigoths of Septimania to aid them against the Arabs, who had taken possession of the country; and after a war of many years' duration, Narbonne, the last of the Arab strongholds, was taken, and the country, freed of these invaders, at once acknowledged P.'s authority. The remaining years of his reign were occupied in reducing the independent monarchy of Aquitaine, which was not accomplished till, after nine years (760—768) of desolating warfare, P. obtained the assassination of his opponent, Duke Waifre, whose partisans then laid down their arms, surrendering to the Frankish monarch the vast provinces which stretch from the Loire to the ocean and the Pyrenees. Shortly after this conquest, P. died of dropsy, September 768. He was a most active, enterprising, and in general fortunate prince; he established the unity of the Gallic nation, and protected it as far as could be done by invading and ravaging the territories of the neighbouring nations, though he also introduced those elements of weakness into its constitution which reduced the authority of his successors to such a deplorable state. The others of this name, though important personages at the time, make little figure in history.

PEPPER (*Piper*), a genus of plants of the natural order *Piperaceæ* (q.v.), which once included the whole of that order; but, as now limited, consists of plants with woody stems, solitary spikes opposite to the leaves, and covered with flowers on all sides, the flowers mostly hermaphrodite. The most important species is COMMON P. or BLACK P. (*P. nigrum*), a native of the East Indies, now cultivated also in many tropical countries, and extensively in some parts of the New World; its fruit being the most common and largely used of all spices. It is a rambling and climbing shrub, with smooth and spongy stems, sometimes twelve feet in length; and broadly ovate, acuminate, leathery leaves. The fruit is about the size of a pea, of a bright-red colour when ripe, not crowded on the spike. In cultivation, the P. plant is supported by poles, or by small trees planted for the purpose, as it loves a certain degree of shade, and different kinds of trees are often planted for this purpose in India. It is propagated by cuttings, comes into bearing in three or four years after it is planted, and yields two crops annually for about twelve years. When any of the 'berries' of a spike begin to change from green to red, all are gathered, as when more fully ripe they are less pungent, besides being apt to drop off. They are spread on mats and separated from the spikes by rubbing with the hands or by treading with the feet, after which they are cleaned by winnowing. The *Black P.* of commerce consists of the berries thus dried, and become wrinkled and black; *White P.* is the seed freed from the skin and fleshy part of the fruit, to effect which the dried fruit is soaked in water and then rubbed. *White P.* thus prepared is of a whitish-gray colour, but not unfrequently undergoes a bleaching by chlorine, which improves its appearance at the expense of its quality. *Black P.* is much more pungent than *White P.*, the essential constituents of the spice being more abundant in the outer parts of the fruit than in the seed. P. depends for its properties chiefly on an acrid resin and an acrid volatile oil; it contains also a crystalline substance called *Piperin*.—The fruit of *Piper tricoicum*, a species very similar to the Common P., is more pungent; and it is cultivated in some parts of India.—The fruit of other species of *Piperaceæ* is used as pepper in their native countries; that of *Cocobryon Capense* at the Cape of Good Hope; that of *Peltobryon longifolium*, of *Artanthe crocata*, of *A. trichostachya*, and of *Serronia jaborandi* in South

America.—*Chavica Roxburghii* and *C. officinarum* yield the LONG PEPPER of druggists. They have woody climbing stems, solitary spikes opposite to the leaves, dioecious flowers, and the fruits so close together on the spikes as in ripening to become a compact mass. The spikes are gathered when unripe, and dried in the sun. They are used in pickling and for culinary purposes, also in medicine for the same purposes as Common Pepper. They are generally reputed to be more pungent than Common Pepper. *C. Roxburghii* is cultivated in Bengal and the Circars, where it is called *Pippul*; *C. officinarum* in the Dutch East Indian colonies. The root and thickest part of the stem of *C. Roxburghii* are extensively used in India as a stimulant medicine; and are cut into small pieces, dried, and brought to the market under the name of *pippula moola*.

P. acts on the skin as a rubefacient and vesicant, and is often used for this purpose in a powdered state, moistened with some kind of alcoholic spirit. It is also employed as a local stimulant in relaxation of the uvula, and is applied in the form of an ointment to ringworm. Taken into the stomach in small quantities it is a pleasant stimulant, but in large doses it produces great pain and irritation. The quantity used, however, by the natives of hot climates much exceeds anything known among Europeans, and the effects are evidently beneficial rather than injurious. The chief use of P. is as a spice and condiment.

P. was known to the ancients; Hippocrates employed it as a medicine; and Pliny expresses his surprise that it should have come into general use, considering its want of flavour. In the middle ages P. was one of the most costly spices, and in the 13th c. a few pounds of it were reckoned a princely present. The quantity now imported into Europe is immense; but there are no means of exactly ascertaining how much of the P. of commerce is the produce of *Piper nigrum*, or indeed of the *Piperaceæ*, and how much—although certainly it is not a large proportion of the whole—is the produce of species of *Capsicum*.

The name P. is popularly given to substances possessing a pungency resembling that of P., although produced by very different plants. Thus, CAYENNE P. is the produce of species of *Capsicum*, of the natural order *Solanaceæ*; JAMAICA P. (or PIMENTO) of species of *Eugenia*, of the natural order *Myrtaceæ*; and GUINEA P., or MELEGUETTA P., of species of the natural orders *Scitamineæ* and *Anonaceæ*. See CAPSICUM, PIMENTO, GRAINS OF PARADISE, and GUINEA PEPPER.

PEPPERMINT. See MINT.

PEPPER-POT, a celebrated West Indian dish, of which Casareep (q. v.) is a principal ingredient; and along with it flesh or dried fish, vegetables, chiefly the unripe pods of the ochro (see HIBISCUS), and chillies (see CAPSICUM).

PEPPER-ROOT (*Dentaria diphylla*), a perennial herbaceous plant, of the natural order *Cruciferae*, a native of North America, with pairs of ternate leaves, and racemes of white flowers; the root of which has a pungent mustard-like taste, and is used as a condiment.

PEPSIN has been already described (in the article DIGESTION) as one of the essential constituents of the gastric juice. Various modes of extracting it from the walls of the stomach of the calf, sheep, and pig have been proposed by different chemists (Wasmann, Frerichs, Schmidt, Boudault, and others), into which it is unnecessary to enter. According to Schmidt's analysis, it contains 53.0 per cent. of carbon, 6.7 of hydrogen, 17.8 of nitrogen, and 22.5

of oxygen, and hence in its ultimate composition it is closely allied to albumen. This substance, either as a powder or in solution, has been employed of late years to a considerable extent in medical practice, in cases of disordered digestion from deficient or imperfect secretion of gastric juice, and of convalescence from typhoid and other debilitating fevers. Pepsin wine is perhaps the best form in which to prescribe this substance; a teaspoonful being the ordinary dose. The fact that pepsin has not been thought deserving of a place in the British pharmacopœia seems to indicate that its efficiency as a remedy is not generally recognised in Great Britain.

PEPYS, SAMUEL, a distinguished officer of the Admiralty during the reigns of Charles II. and James II., was born February 23, 1632—1633. He was the son of a London citizen, a tailor, but was well educated, first at St Paul's School, and afterwards at Magdalen College, Cambridge. His cousin, Sir Edward Montagu (the first Earl of Sandwich), introduced him to public employment. In 1660 he was appointed Clerk of the Acts of the Navy, and in 1673 Secretary for the Affairs of the Navy. He was an excellent public servant, acute, diligent, and laborious; but during the fanatical excitement of the Popish Plot he was committed to the Tower, on an unfounded and absurd charge of aiding in the design to dethrone the king and extirpate the Protestant religion. Having been discharged without a trial, P. was replaced at his post in the Admiralty, which he retained till the abdication of James II. For two years he held the honourable station of President of the Royal Society. He died May 26, 1703. P. wrote *Memoirs of the Royal Navy*, 1690. He left to Magdalen College his large collection of books, MSS., and prints, including about 2000 ancient English ballads, forming five folio volumes. This curious collection was begun, he says, by Selden, and continued down to the year 1700, when the form peculiar to the old ballads, namely, the black letter with pictures, was laid aside for the simpler modern fashion. P. is now best remembered for his *Diary*, deciphered by the Rev. J. Smith from the original shorthand MS. in the Pepysian Library, Cambridge, and first published, under the editorial care of Lord Braybrooke, in 1825. It commences on the 1st of January 1659—1660, and is continued for above nine years, when the diarist was obliged from defective eyesight to abandon his daily task. As a picture of the court and times of Charles II. this *Diary* is invaluable; it was written in perfect confidence and secrecy; the events, characters, follies, vices, and peculiarities of the age are presented in true and lively colours, and the work altogether is one of the most racy, unique, and amusing books in the language.

PE'RA, a suburb of CONSTANTINOPLE (q. v.).

PERAMBULATION OF PARISHES. The ancient custom in England of perambulating parishes in Rogation week had a two-fold object. It was designed to supplicate the Divine blessing on the fruits of the earth; and to preserve in all classes of the community a correct knowledge of, and due respect for, the bounds of parochial and individual property. It appears to have been derived from a still older custom among the ancient Romans, called Terminalia, and Ambarvalia, which were festivals in honour of the god Terminus and the goddess Ceres. On its becoming a Christian custom the heathen rites and ceremonies were of course discarded, and those of Christianity substituted. It was appointed to be observed on one of the Rogation (q. v.) days, which were the three days next before Ascension Day.

Before the Reformation parochial perambulations were conducted with great ceremony. The lord of the manor, with a large banner, priests in surplices and with crosses, and other persons with handbells, banners, and staves, followed by most of the parishioners, walked in procession under the parish, stopping at crosses, forming crosses on the ground, 'saying or singing gospels to the corn,' and allowing 'drinkings and good cheer' (Grindal's *Remains*, pp. 141, 241, and *Note*; Whitgift's Works, iii. 266—267; Tindal's Works, iii. 62, 234, Parker Society's Edition), which was remarkable, as the Rogation days were appointed fasts. From the different practices observed on the occasion the custom received the various names of *processioning*, *rogationing*, *perambulating*, and *ganging the boundaries*; and the week in which it was observed was called *Rogation week*; *Cross week*, because crosses were borne in the processions; and *Grass week*, because the Rogation days being fasts, vegetables formed the chief portion of diet.

At the Reformation, the ceremonies and practices deemed objectionable were abolished, and only 'the useful and harmless part of the custom retained.' Yet its observance was considered so desirable, that a homily was prepared for the occasion; and injunctions were issued requiring that for 'the perambulation of the circuits of parishes, the people should once in the year, at the time accustomed, with the rector, vicar, or curate, and the substantial men of the parish, walk about the parishes, as they were accustomed, and at their return to the church make their common prayer. And the curate, in their said common perambulations, was at certain convenient places to admonish the people to give thanks to God (while beholding of his benefits), and for the increase and abundance of his fruits upon the face of the earth, with the saying of the 103rd Psalm. At which time also the said minister was required to inculcate these, or such like sentences, Cursed be he which translateth the bounds and doles of his neighbour; or such other order of prayers as should be lawfully appointed.' (Burn's *Ecclesiastical Law*, vol. iii. 61; Grindal's *Remains*, p. 168.)

Those engaged in the processions usually had refreshments provided for them at certain parts of the parish, which, from the extent of the circuit of some parishes, was necessary; yet the cost of such refreshment was not to be defrayed by the parish, nor could such refreshment be claimed as a custom from any particular house or family. But small annuities were often bequeathed to provide such refreshments. In the parish of Edgcott, Buckinghamshire, there was about an acre of land, let at £3 a year, called 'Gang Monday Land,' which was left to the parish-officers to provide cakes and beer for those who took part in the annual perambulation of the parish.

To this day, questions of disputed boundary between parishes are invariably settled by the evidence afforded 'by these perambulations; for in such questions, immemorial custom is conclusive. And so far are they recognised in law, that the parishioners on such occasions are entitled to trespass on lands, and even to enter private houses if these stand on the boundary line. In Scotland, where the parochial principle has never been developed as in England, there seem to be few traces of a similar practice. But, as between neighbouring landowners, a brief of perambulation is the technical remedy for setting right a dispute as to boundaries or marches; and perambulating or 'riding' the bounds of boroughs is a common practice.

The necessity or determination to perambulate along the old track often occasioned curious

incidents. If a canal had been cut through the boundary of a parish, it was deemed necessary that some of the parishioners should pass through the water. Where a river formed part of the boundary line, the procession either passed along it in boats, or some of the party stripped and swam along it, or boys were thrown into it at customary places. If a house had been erected on the boundary line, the procession claimed the right to pass through it. A house in Buckinghamshire, still existing, has an oven passing over the boundary line. It was customary in the perambulations to put a boy into this recess to preserve the integrity of the boundary line.

At various parts of the parish boundaries, two or three of the village boys were 'bumped'—that is, a certain part of the person was swung against a stone wall, a tree, a post, or any other hard object which happened to be near the parish boundary. This, it will scarcely be doubted, was an effectual method of recording the boundaries in the memory of these *battering-rams*, and of those who witnessed this curious mode of registration.

The custom of perambulating parishes continued in some parts of the kingdom to a late period, but the religious portion of it was generally, if not universally, omitted. The custom has, however, of late years been revived in its integrity in many parishes.

PERCEPTION. This word refers to our reception of knowledge through the senses, an operation that to the common understanding seems simple enough, but, viewed philosophically, is attended with much difficulty. Perception, considered as a source of knowledge, refers exclusively to the outer, or the object world—the world of extended matter and its properties. The names for the act of knowing one's own mind—the feelings and thoughts of the individual—are Self-consciousness and Self-introspection. The word 'consciousness,' is sometimes improperly limited to this signification. Locke used the term 'Reflection' for the same meaning, but this is ambiguous, and is now disused. All our knowledge is thus said (by those that deny innate ideas) to spring from two sources—Perception and Self-consciousness.

Two great disputes connect themselves with Perception, both raised into their full prominence in the philosophical world by Bishop Berkeley. The first is the origin of our judgments of the Distances and real Magnitudes of visible bodies. In opposition to the common opinion on this subject, Berkeley maintained that these were learned by experience, and not known by the mere act of vision. See VISION.

The second question relates to the grounds we have for asserting the existence of an external and material world, which, in the view of Berkeley, was bound up with the other. Inasmuch as perception is a mental act, and knowledge is something contained in a mind, what reason have we for believing in the existence of objects apart from our minds? or what is the mode of existence of the so-called external world?

The following sentences shew in what manner Berkeley opened up the question: 'That neither our thoughts, nor passions, nor ideas, formed by the imagination, exist without the mind, is what everybody will allow; and it seems no less evident that the various sensations or ideas imprinted on the sense, however blended or combined together (i. e., whatever objects they compose), cannot exist otherwise than in a mind perceiving them. I think an intuitive knowledge may be obtained of this by any one that shall attend to what is meant by the term *exist* when applied to sensible things. The table !

write on, I say, exists—i. e., I see and feel it; and if I were out of my study, I should say it existed, meaning thereby that if I was in my study I might perceive it, or that some other spirit actually does perceive it. There was an odour—i. e., it was smelled; there was a sound—that is to say, it was heard; a colour or figure, and it was perceived by sight or touch. This is all I can understand by these and the like expressions. For as to what is said of the absolute existence of unthinking things, without any relation to their being perceived, that seems perfectly unintelligible. Their *esse* is *percipi*, nor is it possible they should have any existence out of the minds or thinking things which perceive them.

This doctrine of Berkeley, amounting, it was said, to a denial of the existence of a material world (which is far from a correct view of it), was followed up by Hume, who, on similar reasoning, denied the existence of mind, and resolved the universe into a mere flow of ideas and impressions without any subject to be impressed, acknowledging, nevertheless, that he felt himself unable, practically, to acquiesce in his own unanswerable arguments. There was obviously some great mistake in a mode of reasoning that brought about a dead-lock of this description; and hence it has been the work of metaphysical philosophy since that time to endeavour to put the perception of the world on an admissible footing.

Dr Reid reclaimed against Berkeley and Hume, by appealing to Common Sense, or Unreasoning Instinct, as a sufficient foundation for our belief in the existence of a world apart from our own minds. Sir W. Hamilton has expounded the same view with greater clearness and precision. He considers that our consciousness tells us at once that in the act of perceiving there is both a *perceiving subject*—self, or the mind—and an *external reality*, in relation with sense, as the *object perceived*. 'Of the existence of both these things,' he says, 'I am convinced; because I am conscious of knowing each of them, not mediately in something else, as represented, but immediately in itself, as existing. Of their mutual dependence I am no less convinced; because each is apprehended equally and at once, in the same indivisible energy, the one not preceding or determining, the other not following or determined; and because each is apprehended out of, and in direct contrast to the other.'—*Reid*, p. 747.

Much as Hamilton has laboured to elucidate this doctrine in all its bearings, it has not been universally accepted as satisfactory. Many believe that he has regarded as an ultimate fact of our constitution what admits of being still further resolved, and has mistaken an acquisition of the mature mind for a primitive or instinctive revelation.

Professor Ferrier, in his *Institutes of Metaphysics*, has gone through the question with extraordinary minuteness and elaboration. His main position is the inseparability of the subject and the object in perception (a position also maintained by Hamilton in the above extract), which is not reconcilable with the common assumption as to the independent existence of matter. Indeed, he reduces the received dogma of the existence of matter *per se* to a self-contradiction, and builds up a system in strict conformity with the correlation, or necessary connection, of the mind perceiving with the object perceived. He thus approaches nearer to Berkeley than to Hamilton or to Reid.

Those who would endeavour to shew that our notion of the outer world is a complex fact, and an acquisition, and not a simple apprehension of the uneducated mind, explain themselves to the following effect. It is in the exercise of force that we

have to look for the peculiar feeling of the externality of sensible things, or the distinction that we make between what impresses from without, and impressions not recognised as outward. Any impression that rouses a stroke of energy within us, and that varies exactly and constantly as that energy varies, we call an outward impression. Dr Johnson refuted Berkeley, as he thought, by kicking a stone. But in fact it was his own action with its consequences, and not the optical impression of a stone in the eye, that satisfied him as to the existence of something outward. The sum-total of all the occasions for putting forth active energy, or for conceiving this as possible to be put forth, is our external world.

We experience certain uniformly recurring sensations, and certain uniform changes in these, when we exert particular energies. Thus the visible picture of our dwelling is a permanent and habitual experience, and the variations of appearance that it is subject to correspond principally to our own conscious movements. As we move from one end of a room to another, we experience a change of the visible aspect at every step, and this regularly happens as often as we repeat the movement. But at times the appearance exists in another shape, to which we give the name of memory or *idea*. We draw a marked distinction between these two modes of presentation, the actual and the ideal, and we assign a superiority to the one over the other. The superiority we find connects itself with the relation to our own movements; a mere idea or mental picture remains the same whatever be our bodily position or bodily exertions; the sensation that we call the *actual* is entirely at the mercy of our movements, shifting in every possible way (but uniformly) according to the varieties of action that we go through. With a forward movement the visible impression enlarges, with a backward movement it diminishes. A certain movement of the eye shuts it out, another restores it. The raising of the head and the bending of the body are followed by an altered spectacle. We cannot but draw a broad distinction between the mental scenery that is thus shifted by all our movements, and the ideas and dreams that vary of themselves while we are still. To express the one fact, we use the terms externality, the material world, independent existence; to express the other we employ the opposite language, internality, the world of mind, &c. Even if sensation were only in ourselves, we should still have to distinguish between present sensation and remembered or revived sensation; the reference of the one to our voluntary movements, and of the other to no such modifying causes, would oblige us to note a vital difference in the two classes of facts. Such is the uniformity of connection between certain appearances and certain movements, that we come to anticipate the one through the other. We know that in some one position, as when lying in bed, certain movements of the limbs and back will bring us to the sensation of a solid contact in the feet; that another series of movements will bring on a particular view to the sight; that a third movement will give the sound of a bell in the ear, and so forth. We cannot avoid regarding those various sensible effects, brought uniformly into play by a regular series of waking voluntary actions, as totally different from our ideas, recollections, and dreams.

As our belief in the externality of the causes of our sensations means that certain actions of ours will bring the sensations into play, or modify them in a known manner, this belief is readily furnished by experience, and is no more than our experience entitles us to entertain. When we have been

repeatedly conscious that a tree becomes larger and larger to the eye in connection with a definite locomotion on our part, called the forward advance; that this movement brings on at last a sensation of touch; that this sensation of touch varies with definite movements of the arms, and so on; the repetition of all this train of experience fixes it on the mind, so that from one thing alone, as from the distant vision of the tree, we can anticipate, or as it is otherwise called, *perceive* all the other consequences. We then know, without going through the steps, that the specified movements will bring about all the sensations above described, and we know nothing else; this knowledge, however, is to us the recognition of external existence, the actual fact that is meant when a material world is spoken of. Belief in external reality is the sure anticipation of certain sensations on the performance of certain movements; everything else said to be implied in it is but a convenient hypothesis for aiding the mind in holding together those multifarious connections that our experience has established in the mind. In order to account for the fact that the conscious movement of elevating the upper eyelid is followed with the sensation of light, to us and to other minds, we suppose a luminous agency always existing even when not affecting us or any other person; we cannot know or verify this supposition—it is a generalisation founded upon particular experiences, and serving to sum up those experiences in a convenient form, but no such perennial independent substance can be absolutely proved.

PERCEVAL, SPENCER, RIGHT HON., English minister, was the second son of John, Earl of Egmont; born November 1, 1762; educated at Harrow, and at Trinity College, Cambridge. He was called to the bar, and soon obtained a reputation as a diligent lawyer. A clever pamphlet on the abatement of the impeachment of Warren Hastings, made him known to Pitt. Obtaining a seat in parliament for Northampton, he was soon conspicuous for his extreme horror of popery, and his violent advocacy of what was called by his party the 'Protestant interest.' In the Addington administration, he was made Solicitor-general in 1801, and Attorney-general in 1802. He was afterwards induced to abandon his profession, and adopt a political career. In the Portland administration of 1807, he was made Chancellor of the Exchequer, and was even then the real head of the government, his influence with George III. being obtained by the depth of his bigotry and his pertinacious opposition to the Catholic claims. On the death of the Duke of Portland in 1809, P. became Premier, uniting to his office of Chancellor of the Exchequer that of First Lord of the Treasury. He was retained in power by the Prince of Wales on his accession to the regency. On the 11th May 1812, about 5 p.m., as P. was entering the lobby of the House of Commons, a man named Bellingham fired a pistol at him, the ball pierced his heart, and he instantly expired. The assassin made no attempt to escape. He was a Liverpool broker, trading with Russia, who, having sustained some losses and injuries, which he had vainly applied to the government to redress, determined to avenge himself by taking the life of the prime minister. P.'s assassination shocked the public mind, and parliament hastened to make an ample provision for his widow and numerous family. His death was, however, rather a private than a public calamity. 'With all my respect for the virtues and excellences of the late minister,' said the Marquis of Wellesley, who had held the office of Foreign Secretary in his administration, 'I still feel it my duty to say that I did not consider him a

fit man to lead the councils of this great empire.' He was ready in debate, a placid and not ungraceful speaker, and led the House of Commons with much tact; but he was superficial and intolerant. Sydney Smith, in his *Letters of Peter Plymley*, has conferred a species of immortality upon him by his wit and sarcasm. It was the fashion, when P.'s public policy was attacked, to laud his domestic virtues. 'Peter' said, if he had to choose between public and private virtues, he should prefer that Mr P. 'owed for the veal of the preceding year, whipped his boys, and saved his country.'

PERCH (*Perca*), a genus of acanthoptercus fishes, of the family *Percidæ*, to which it gives its name, and which includes many genera and a very great number of species both of marine and fresh-water fishes. The *Percidæ*, or P. family, have the body somewhat oblong and more or less compressed; the scales rather large; the bones of the gill-covers toothed or otherwise armed; the mouth without barbels; the vomer toothed, and generally also the palate; there are sometimes two dorsals, sometimes only one. To this family belong not only the true perches, all of which are fresh-water fishes, but the Lates (q. v.) of the Nile, the Basse (q. v.) or Sea P., and their congeners the Pike Perches (q. v.), the *Serrani*, and many other fishes. The true perches (*Perca*) have two dorsal fins, distinct and

Perch (*Perca fluviatilis*).

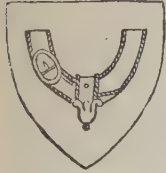

separate, the rays of the first spinous and those of the second flexible; the tongue is smooth; and the gill-covers are bony, notched, and sharply serrated. The COMMON P. (*P. fluviatilis*) is an inhabitant of the lakes, ponds, and still rivers of almost all parts of Europe. It is very common in England and Ireland, and is found in many of the waters of the south of Scotland, although in the north it is rare, and is said to exist only where it has been introduced. But it is found in Scandinavia, and even in Lapland. It is of a greenish-brown colour, passing into golden yellow on the under parts, and marked on the back with six or seven indistinct blackish cross-bands. Its height is about one-third of its length. It often attains a length of 16 or 18 inches, and a weight of 2 or 3 pounds, but perches have been taken of 8 pounds weight or more. The P. loves still waters, and is easily reared in ponds, but it is not a desirable inmate of ponds intended for other fish, because it is very voracious, and devours their fry. It is readily caught by almost any kind of bait, and sometimes takes a small artificial fly. It is much esteemed for the table. It lives a long time out of the water if kept moist, and in some countries is thus brought to market, and carried back to the pond if not sold. The female P. deposits her eggs in long strings, united by a viscid matter.—A species of P. (*P. Italica*), found in the south of Europe, differs from the Common P. in its shorter and deeper form, and want of black bands. Several species are natives of the rivers and lakes of Nor-

America, and are among the most esteemed of its fresh-water fishes.

PERCH. See ROD.

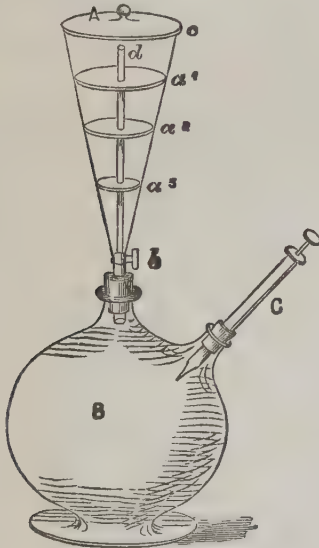

PERCLO'SE, a railing or other enclosure separating a tomb or chapel from the rest of a church.

PERCLOSE, or **DEMI-GARTER**, in Heraldry, the lower half of a garter with the buckle.

Perclose.

PERCOLATION, a process much used in Pharmacy, and in some other arts, for extracting certain soluble properties of various bodies by filtering a liquid through them. In the new British pharmacopœia, 39 tinctures and 9 extracts are ordered to be prepared by percolation. As the fluid soaks in and passes through the material acted upon, it displaces and carries with it the soluble parts, hence percolation is sometimes called the *Method of Displacement*. The forms of apparatus for percolation are very numerous, but the principle is the same in all—viz., a vessel with a porous bottom, and in the form of a truncated cone inverted, receives the material first, and over it is poured the water or other fluid which is to extract its virtues. One made by an eminent French pharmacien, M. Bejot, is very effective and complete. A is a long funnel-shaped glass, with a glass stop-cock (b) in the

Percolator.

bottom, which narrows to an inch in diameter; this fits into the neck of a large globular vessel B, both being adjusted by grinding. C is a syringe of brass fixed in the glass B as shewn, and made air-tight by a caoutchouc washer. a^1 , a^2 , a^3 are three diaphragms of porous felt, pierced by the tube d, which allows air bubbles to escape from the bottom without disturbing the fluid. The material to be acted upon, as wood, bark, root, leaves, &c., is first powdered, and is then laid on the top of the uppermost diaphragm, a^1 , so as to half fill the space between it and the glass-cover c; water, or any other required fluid, is then poured in until it is filled, the stop-cock b is opened, and the operator draws the air from the outer vessel by means of the

air-pump C, the fluid is thus rapidly drawn through the material, and displaces its soluble parts. a^1 and a^3 arrest the fine solid particles which are carried through the first diaphragm with the liquid, and form sediments which are also acted upon by the liquid which is checked at each division for a time. The fluid, when it reaches the globular glass, however dark-coloured, is beautifully bright and clear, and the preparations so made are remarkable for their good quality and uniformity of strength. In 1864, Dr Redwood, of the Pharmaceutical Institution of Great Britain, invented a new percolator of great efficacy. It consists of a tinned-copper cylinder, with a cylinder c flannel inside, in which the materials are put. The whole is filled with the fluid menstruum, and as that which is in more immediate contact with the solid materials becomes charged with the soluble matter displaced, it gives rise, as its density is increased, to an endosmotic action through the flannel walls of the inner cylinder until the whole is equalised, when it is drawn off by the tap, and fresh fluid added until it comes away colourless. The outer cylinder has a tight cover to prevent loss by evaporation.

PERCUSSION, in Medicine, is the method of eliciting sounds by tapping, or gently striking the surface of the body; its object being to determine by the nature of the sound the comparative density of the subjacent parts. This means of diagnosis was first employed by Avenbrugger in the middle of last century, and it was afterwards adopted by Corvisart in the investigation of heart diseases; but its value was not fully appreciated till Laennec made the diseases of the chest his peculiar study; and since his time, its application and various uses have been considerably extended by the labours of Piorry, Hughes Bennett, and other physicians.

Percussion is chiefly employed in the diagnosis of diseases of the lungs, heart, and abdominal organs. It may be *direct* (or, as some writers term it, *immediate*), or it may be *mediate*. In the former case, the part to be examined is struck with the ends of the three first fingers set close together on the same level, or with a small hammer tipped with India-rubber; while in the latter, which is now almost universally adopted, a flat body is placed upon the chest, or other part to be examined, and is then struck by the fingers or hammer. The flat intervening body is termed a *Pleximeter* (from the Gr. *plexis*, a blow, and *metron*, a measure). The instrument usually sold as a pleximeter is a flat oval piece of ivory, but the left index or middle finger of the physician, with its flat surface fitted accurately to the part to be examined, acts equally well. The force of the stroke on the pleximeter—whether the stroke be made with the fingers or the hammer—must vary according as it is desired to elicit the sound from a superficial or a deep-seated part. The surface to be percussed should be exposed, or, at most, only covered with one layer of clothing; and the blow should fall perpendicularly on the pleximeter. When percussion is made over a considerable cavity filled with air—as the stomach or intestines—a hollow, drum-like, or (as it is usually termed by medical writers) a *tympanitic* sound is produced. When any part of the surface of the chest is struck, below which there is a considerable depth of healthy lung-tissue, consisting of small cells filled with air, a clear sound, less loud and hollow than the tympanitic sound, and termed the *pulmonary percussion note*, depending partly on the vibrations of air in the lung-cells, and partly on the vibrations of the walls of the chest, is evolved. When the subjacent substance is solid (as the heart, liver, or spleen) or fluid (as when there is effusion into a closed sac),

the sound is *dull* in proportion to the density and want of elasticity of the part struck. The first thing that must be acquired in order to make percussion useful in the diagnosis of disease, is an accurate knowledge of the sounds elicited from the different parts in their normal condition. When, for example, the healthy pulmonary percussion note is known, increased resonance of the walls of the chest will indicate a dilatation of the air-cells (or Pulmonary Emphysema), while various degrees of dullness will afford evidence of such morbid changes as the effusion of fluid into the pleura (Hydrothorax), or inflammatory solidification of the lung-tissue (the Hepatisation of Pneumonia), or tubercular deposition. The use of percussion in relation to diagnosis is further shewn in the articles PERICARDITIS and PLEURISY.

PERCUSSION CAPS are small copper cylinders, closed at one end, for conveniently holding the detonating powder which is exploded by the act of percussion in percussion-arms. Caps were not used with the earliest percussion-arms, which the Rev. Mr Forsyth of Belhelvie, Aberdeenshire, patented in 1807; but they became tolerably general between 1820 and 1830, and were adopted for the army by 1840. The manufacture is extremely simple: A sheet of thin copper is stamped into pieces of appropriate shape, which are bent into the form of caps by stamping-apparatus closing round a mandril, the whole being done in one machine by two operations. The caps are then placed in a tray, mouths upward; and the inside of each is touched with a strongly adhesive varnish. Over this is dusted the detonating powder, all the particles which fail to adhere being blown, dusted, or shaken out. A stamper once more is forced into the cap, to fix and compress the powder, and the operation is completed. Large numbers are filled and stamped together, so that many thousands per hour may be turned out by one machine. Admirable mechanism, for the manufacture of caps, is employed in the Royal Laboratory at Woolwich.

For muskets, the caps are charged with equal parts of fulminating mercury and chlorate of potash; for cannon, with a mixture composed of two parts of chlorate of potash, two parts of native sulphuret of antimony, and one of powdered glass; the last ingredient taking no part in the chemical action, and being added merely to increase the friction. For the manner in which a cap is used, see LOCK.

PERCUSSION, CENTRE OF. See CENTRE OF PERCUSSION.

PERCY. This is the name of a noble Norman family who accompanied the Conqueror to England, and whose head, William de Percy, obtained from his sovereign thirty Knights' Fees in the north of England. The representation of the house devolved (temp. Henry I.) on Agnes, daughter of the 3d baron, who married Josceline of Lovain, brother-in-law of the king, only on condition that he adopted either the surname or the arms of P.; he chose to retain his paternal arms and to assume the P. name. The head of the family at the time was one of the chief barons who extorted Magna Charta from King John; and the 9th feudal lord (temp. Edward I.) shewed a similar spirit towards the pope, against whose demands he maintained, with others of the greater barons, the spiritual independence of the English crown. This nobleman's great-grandson was a distinguished military commander under Edward III., and acting as Marshal of England at the coronation of Richard II., was created Earl of Northumberland. He subsequently, however, took up arms against Richard, and placed the crown on

the head of Henry of Lancaster, who became Henry IV. Again dissatisfied with the government, he joined in rebellion with his son Hotspur, for the purpose of transferring the crown to Mortimer, Earl of March. The earl, with the other leaders of this rebellion, fell at Bramham Moor (1407—1408), and his titles became forfeited. These, however, were revived in favour of his grandson, who became Lord High Constable of England, and who was killed at the battle of St Alban's. This earl's son and successor (the third earl) met a like fate on Towton field, fighting in the van of the Lancastrian army. The 4th earl (who obtained a reversal of his father's attainder) was murdered by the populace in Northumberland, when ordered by the avarice of Henry VII. to enforce a subsidy. The executions of the 6th and 7th earls by Edward VI. and Elizabeth are part of the history of England. The 8th earl was committed to the Tower, on a charge of being concerned in a plot in favour of Mary Queen of Scots, and died a violent death in prison. The 10th earl fought in the civil wars against Charles I., though he took no part with the regicides, and eventually joined in the general effort to bring about the Restoration. The 11th earl left an only child, who succeeded to the ancient barony of P., and marrying Charles, Duke of Somerset, became the mother of Algernon, Duke of Somerset, who was created Earl of Northumberland, with remainder to his son-in-law, Sir Hugh Smithson, of Stanwick, in the county of York, a gentleman of respectable lineage. Sir Hugh, succeeding to the earldom, obtained in 1766 his advancement to the dukedom of Northumberland, which title is now held by Algernon George Percy, born in 1810, who succeeded to the dukedom in 1867.

PERCY, THOMAS, D.D., an eminent poetical collector, antiquary, and scholar, was born at Bridgenorth, Shropshire, in 1728; was educated at Christchurch, Oxford; and having entered the church, rose to be Bishop of Dromore, in Ireland, 1782. He died in 1811. This amiable and accomplished prelate, the friend of Johnson, Goldsmith, and other distinguished contemporaries, published translations from the Icelandic, a new version of the *Song of Solomon*, the *Northumberland Household Book*, a translation of Mallet's *Northern Antiquities*, &c. His most popular and valuable contribution to our literature was the *Reliques of Ancient English Poetry*, consisting of old heroic ballads and songs, with some modern imitations, in which the editor himself displayed the taste and feeling of a poet. This work appeared in 1765, and P. lived to see four editions of it called for by the public, and to receive the warm commendations of all poetical readers and critics. The *Reliques* were chiefly obtained from an old folio MS. that had fallen into P.'s hands, with the addition of pieces from the Pepys collection at Cambridge, the Ashmole Library at Oxford, the British Museum, and the works of our earlier poets. Certain liberties were taken with some of the ballads—softening touches, repairs, and renovations—for which the editor was severely censured by Ritson and other antiquaries; but the collection was of great value to our literature, recalling the public taste to the rude energy, picturesqueness, and passion of the old chivalrous minstrels and Elizabethan songsters. It captivated the youthful imagination of Walter Scott, and was the inspirer and model of his *Minstrelsy of the Scottish Border*. The memory of P. has been still further perpetuated by a Club Book Association, called the **PERCY SOCIETY**. See CLUB BOOKS, in SUPP., Vol. X.

PERDIDO, a bay and river of Alabama, U. S.

The bay, 20 miles long by 6 to 10 miles wide, opens by a narrow channel into the Gulf of Mexico, 18 miles west of the entrance to Pensacola Bay; the river rises in South-Western Alabama, and bay and river form the boundary between Alabama and Florida.

PEREGRINE FALCON (*Falco peregrinus*), a species of Falcon (q. v.) found in almost all parts of the world. The female is larger than the male, being about 18 inches in length from the tip of the bill to the tip of the tail, whilst the male is only about 15 inches. The female is the *Falcon* of falconers, and the male the *Tercel*. The plumage of the two sexes is very similar. The back, wings, and tail are bluish-slate or ash-gray, the feathers barred with a darker tint; the crown of the head, back of the neck, and a spot below the eye, nearly black; the front of the neck white, with dark longitudinal lines; the breast, belly, and plumage of the legs, whitish, with dark-brown transverse bars. The wings are very long, reaching almost to the tip of the tail; and, the bird is remarkable for its power of flight, being capable of maintaining for a considerable time a rate of more than 100 miles an hour, so that it is often seen far from any of its haunts or breeding-places; whence the name Peregrine, from the Latin *peregrinus*, a wanderer. Its swoop, when rushing on its quarry, is wonderful both for rapidity and force. The P. F. can easily carry through the air a bird or quadruped fully its own weight. Its ordinary prey consists of grouse, woodcocks, rabbits, &c. The woodcock in vain seeks to escape from it by threading its way among branches of trees and brushwood; the falcon follows, and exhibits at least an equal power of moving with great rapidity in the thicket without getting entangled or stayed. Sometimes the quarry soars into the air, and seeks safety by trying to keep above the falcon, till both are lost to ordinary sight; but the falcon generally gets uppermost, and 'strikes' it at last. The quantity of game destroyed by the P. F. is very great. It is supposed that a single nest of peregrine falcons will consume nearly 300 brace of grouse in a season, besides much other prey. The P. F. is a bird as remarkable for boldness as for power of flight. It has sometimes been seen to pounce on game shot by a sportsman, before it could fall to the ground; and an instance occurred in Yorkshire of a P. F. dashing through the glass of an aviary in a town, and carrying off a bird. It makes its nest on ledges of high rocks, either on the sea-coast or in inland precipices and ravines, and lays from two to four eggs. Numerous localities in Britain have long been noted as breeding-places of the P. F., and some of them were regularly visited, whilst falconry was a favourite sport, for young birds, which were not procured without danger and difficulty. The bird, caught when adult, although more difficult to train, was, however, believed to possess superior qualities. The P. F. is more docile, and becomes more gentle than the Gyr-falcon. The young female of the P. F. has been by mistake described by Pennant and others under the name of the Lanner (q. v.), a species not found in Britain. For fig. of P. F., see FALCONRY.

PEREIRA, JONATHAN, the pharmacologist, was born in the parish of Shoreditch, London, 22d May, 1804. After a distinguished career at a classical academy in Finsbury, where he remained for four years, he devoted himself to the study of medicine, and in 1823 was appointed resident medical officer of the General Dispensary in Aldersgate Street, at which institution he became, three years afterwards, lecturer on

chemistry. His attention was early attracted to the study in which he has become famous. In 1824, he published a translation of the *London Pharmacopœia*; which was followed by *A Manual for the Use of Students*; *A General Table of Atomic Numbers, with an Introduction to the Atomic Theory*; and other text-books for the use of those who were preparing for medical examinations. He contributed numerous papers to the professional journals on the properties and adulteration of drugs, and laid the foundation of those researches which issued in his great work on *Materia Medica*. In 1832, he resigned the office of lecturer for that of Professor of *Materia Medica* in the New Medical School in Aldersgate Street, and at the same time he succeeded Dr Gordon as Lecturer on Chemistry at the London Hospital. His *Elements of Materia Medica* (first published in the form of lectures contributed to the *Medical Times and Gazette*) appeared as a separate work in 1839—1840, and at once established his reputation as a pharmacologist. The treatise is remarkable for the extent of its research, the variety of its information, whether scientific, commercial, or practical, and the scrupulous exactness of its statements. In 1841, he procured the licence to practise in London from the College of Physicians; in 1845, he was elected a Fellow of that body; and on the establishment of the London University, he was appointed Examiner in *Materia Medica* and Pharmacy, a post which he filled with admirable efficiency till his death. Among his other contributions to science, the best known are his excellent treatises on *Diet* and on *Polarised Light*, both of which appeared in 1843. His death, which took place on January 20, 1853, was the result of a fall down a flight of steps in the College of Surgeons, and was deeply felt, not only by his professional brethren, but by the numerous scientific bodies, such as the Royal, the Linnæan, and the other societies of which he was a distinguished Fellow.

PEREKOP, ISTHMUS OF, in South Russia, government of Taurida, 18 miles long, 16 miles broad at its southern, and 5 miles broad at its northern extremity, connects the peninsula of the Crimea with the mainland of European Russia. It is an arid waste of mere sand, or sand combined with clay. There are, however, numerous salt lakes, and salt is extensively made. In the north of the isthmus, and forming the key to the Crimea, is the small town of Perekop. Notwithstanding its advantageous position at the convergence of the numerous roads leading from South Russia into the Crimea, P. is of little commercial importance. Pop. of town 4982.

PERE-LA-CHAISE. See LA-CHAISE.

PEREMPTORY DEFENCES, in Scotch Law, mean defences to an action or suit, which amount to an entire negative of the right of action, as distinguished from a preliminary or temporary defence.

PERENNIAL, in Botany, a term employed in contradistinction to Annual (q. v.) and Biennial (q. v.), to designate plants which subsist for a number of years. Some plants, however, which are annual in cold climates, are perennial in warmer regions. The term perennial is in general applied only to herbaceous plants, and indicates a property only of their roots, the stems of most of them dying at the end of each summer. Perennial herbaceous plants, like shrubs and trees, are capable of producing flowers and fruit time after time, in which they differ from annual and biennial plants, which are fruitful only once. Those plants which are capable of being propagated by cloves, offset bulbs, or tubers, are all perennial. Thus the potato is a perennial plant, a though the crop is planted in spring and reaped in autumn, like

that of corn, whilst all the corn plants are annuals. —There is great diversity in the duration of life of perennial plants.

PERESLAV, or PEREIASLAVLE-ZALIE'-SKY, a district town in the middle of Great Russia, in the government of Vladimir, and 70 miles north-west of the city of that name. It was founded in 1052 by George, Prince of Soudsal. It possesses upwards of 30 churches and religious institutions; but is principally noteworthy for its factories, which are nine in number, and of which the most important are cotton-mills and print-works for cotton goods. The factories yield in all an annual profit of about £1 000,000. The cotton manufactures of P. are exported to the fairs of Nijni-Novgorod and Irbit, and even to China by way of Siberia. Pop. 6783, employed in the factories and in the productive fishery of Lake Pleshtcheieff.

PEREZ, ANTONIO, minister of Philip II. of Spain, was born in Aragon in 1539. His father was Secretary of State under Charles I. and Philip II., and he himself was appointed to this office when only 25 years of age, and acquired the entire confidence of the king. Don Juan d'Austria, having sent his confidant, Juan de Escovedo, to Spain, to solicit aid against the party of Orange; and Escovedo having rendered himself an object of hatred both to the king and to P., the former resolved to put him out of the way by murder, and intrusted P. with the accomplishment of this design, which P., to gratify his own revenge, accomplished accordingly, 31st March 1578. The family of Escovedo denounced P. as the murderer, and all his enemies joined against him. The king at first sought to shield him; but in July 1581 he was arrested, and by torture forced to confess. He succeeded, however, in making his escape to Aragon, where he put himself under protection of its laws. After a long and severe inquiry into his conduct, he was found guilty of many acts of fraud and corruption, and condemned to death in Madrid; but the *Justicia Major*, or highest court of justice in Saragossa, refused to deliver him up. The king applied for aid in May 1591 to the Inquisition, and the Aragonese court delivered him up to its agents, but the people rose in tumult, and liberated him. This happened repeatedly; and at last, in September 1591, Philip II. entered Aragon with an army powerful enough to subdue all opposition, abolished the old constitutional privileges of the country, and caused a number of the principal people to be executed. P., however, made his escape, avoiding the many plots which the king laid for his assassination. He was condemned in Spain as a heretic, but was treated with great kindness in Paris and London. He spent the latter years of his life in Paris, and died there in 1611 in great poverty. P. wrote an account of his misfortunes, which was published at Paris in 1598, under the title of *Relaciones*.

PERFECTIBILITY OF CHRISTIANS, a doctrine held by the Wesleyan Methodists (see METHODISTS) of a *Christian perfection* attainable in this life. It is not a perfection of justification, but a perfection of sanctification; which John Wesley, in a sermon on Christian Perfection, from the text Heb. vi. 1, 'Let us go on to perfection,' earnestly contends for as attainable in this life by believers, by arguments founded chiefly on the commandments and promises of Scripture concerning sanctification; guarding his doctrine, however, by saying that it is neither an *angelic* nor an *Adamic* perfection, and does not exclude ignorance and error of judgment, with consequent wrong affections, such as 'needless fear or ill-grounded hope, unreasonable love, or unreasonable aversion.' He admits, also, that even in

this sense it is a rare attainment, but asserts that 'several persons have enjoyed this blessing, without interruption, for many years, several enjoy it at this day, and not a few have enjoyed it unto their death, as they have declared with their latest breath, calmly witnessing that God had saved them from all sin, till their spirit returned to God.' Concerning all which, the general belief of Protestant Christians is, that these persons were merely more self-complacent and less sensible of their own corruptions than is usual, and that the commands and promises concerning sanctification are all susceptible of an explanation consistent with remaining corruption in believers, and a need of further sanctification, or a continued going on unto perfection whilst this life endures.

That perfection is attainable in this life, is held by the Franciscans, Jesuits, and Molinists in the Church of Rome, but denied by the Dominicans and Jansenists.

PERFECTIONISTS, or BIBLE COMMUNISTS. See SUPPLEMENT in Vol. X.

PERFORMANCE OF CONTRACTS is one of the modes of satisfying the contract, which may be either by doing some specific thing, or not doing something, or by payment of money. It is a good answer to any action brought by one party against another for breach of contract, that what was contracted for has been already performed.

PERFUMERY, PERFUMES (Fr. *parfum*, from Lat. *fumus*, smoke or vapour), delicate fumes or smells. Perfumes are of three distinct classes when derived from plants, and there is a fourth class, which are of animal origin.

CLASS I.—These are the most ancient, and have been in use from the earliest period of which there is record. They consist of the various odoriferous gum-resins, which exude naturally from the trees which yield them; and to increase the produce, the plants are often purposely wounded. The most important are benzoin, olibanum, myrrh, and camphor. No less than 5000 cwt. of these together are annually imported into Britain. Gum-resins form the chief ingredients in 'Incense,' (q. v.), and in Pastilles (q. v.).

CLASS II. are those perfumes which are procured by distillation. As soon as the Greeks and the Romans learned the use of the still, which was an invention imported by them from Egypt, they quickly adapted it to the separation of the odorous principle from the numerous fragrance-bearing plants which are indigenous to Greece and Italy. An essential oil or otto thus procured from orange-flowers bears in commerce to this day the name of Neroly, supposed to be so named after the Emperor Nero. Long before that time, however, fragrant waters were in use in Arabia. Odour-bearing plants contain the fragrant principle in minute glands or sacs; these are found sometimes in the rind of the fruit, as the lemon and orange; in others, they occur in the leaves, as sage, mint, and thyme; in wood, as rosewood and sandal-wood; in the bark, as cassia and cinnamon; in seeds, as caraway and nutmeg. These glands or bags of fragrance may be plainly seen in a thin cut stratum of orange-peel; so also in a bay leaf, if it be held up to the sunlight, all the oil cells may be seen like specks. All these odour-bearing substances yield by distillation an essential oil peculiar to each; thus are procured oil of patchouly from the leaves of the patchouly plant, *Pogostemon patchouly*, a native of Burmah; oil of caraway, from the caraway seed; oil of geranium, from the leaves of the *Geranium rosa*; oil of lemon, from

lemon-peel; and a hundred others of infinite variety.

The old name for these pure odoriferous principles was Quintessence. Latterly, they have been termed Essential Oils; they are now, in modern scientific works, often termed Ottos, from the Turkish word attar, which is applied to the well-known otto or attar of roses. See OIL.

All the various essential oils or ottos are very slightly soluble in water, so that in the process of distillation the water which comes over is always fragrant. Thus, elder water, rose water, orange water, dill water are, as it were, the residue of the distillation for obtaining the several ottos. The process of Distillation (q. v.) is very simple; the fragrant part of the plant is put into the still and covered with water; and when the water is made to boil, the ottos rise along with the steam, are condensed with it in the pipe, and remain floating on the water, from which they are easily separated by decanting. In this way 100 pounds of orange, lemon, or bergamot fruit peel will yield about 10 ounces of the fragrant oil; 100 pounds of cedar wood will give about 15 ounces of oil of cedar; 100 pounds of nutmeg will yield 60 to 70 ounces of oil of nutmeg; 100 pounds of geranium leaves will yield 2 ounces of oil.

Every fragrant substance varies in yield of essential oil. The variety of essential oils is endless; but there is a certain relationship among odours, as among tints. The lemon-like odours are the most numerous, such as verberna, lemon, bergamot, orange, citron, citronella; then the almond-like odours, such as heliotrope, vanilla, violet; then spice odours, cloves, cinnamon, cassia. The whole may be classified into twelve well-defined groups. All these ottos are very soluble in alcohol, in fat, butter, and fixed oils. They also mix with soap, snuff, starch, sugar, chalk, and other bodies, to which they impart their fragrance.

The principal consumption of the various fragrant ottos is for scenting soap. Windsor soap, almond soap, rose soap, and a great variety of others, consist of various soaps made of oil and tallow, perfumed while in a melted state with the several named ottos or mixtures of them.

Though snuff is by no means so popular an article in the reign of Victoria as it was in Anne's time, yet the increased population and greater exports to the British colonies cause the production of scented snuff to be greater than it was fifty years ago, and it is especially in demand in the fur countries of Northern Canada. There is a large consumption of fragrant essential oils in the manufacture of toilet powders; under the various names of rose powder, violet powder, &c., a mixture of starch and orris, differently scented, is in general demand for drying the skin of infants after the bath.

Precipitated chalk and powdered cuttle-fish bone, being perfumed with otto of roses, powdered myrrh, and camphor, become 'Dentifrice.' The oils of peppermint, lavender, rose, and others, are extensively used in scenting sweetmeats and lozenges.

During the year ending June 30, 1870, there were imported into the U. States for consumption 5102 ounces of otto of roses, valued at \$23,305; essence of bergamot, 20,461 pounds, valued at \$62,045; orange and lemon, 60,665 pounds, valued at \$123,269; citronella, 16,202 pounds, valued at \$15,328; cassia, 14,613 pounds, valued at \$16,385, and fruit ethers, or essence of apples, pears, &c., 169 pounds, valued at \$345.

CLASS III.—These are the perfumes proper, such as are used for perfuming handkerchiefs, &c. Contrary to the general belief, nearly all the perfumes derived from flowers are not made by distillation, but by the processes of *enfleurage* and *maceration*. Although this mode of obtaining the

odours from flowers has certainly been in practice for two centuries in the valley of the Var, in the south of France, it is only by the publication of a recent work* that the method has been made generally known. The odours of flowers do not, as a general rule, exist in them as a store or in a gland, but are developed as an exhalation. While the flower breathes it yields fragrance, but kill the flower, and fragrance ceases. It has not been ascertained when the discovery was made of condensing, as it were, the breath of the flower during life; what we know now is, that if a living flower be placed near to grease, animal fat, butter, or oil, these bodies absorb the odour given off by the blossom, and in turn themselves become fragrant. If we spread fresh unsalted butter upon the bottom of two dessert-plates, and then fill one of the plates with gathered fragrant blossoms of clematis, covering them over with the second greased plate, we shall find that after 24 hours the grease has become fragrant. The blossoms, though separated from the parent stem, do not die for some time, but live and exhale odour; which is absorbed by the fat. To remove the odour from the fat, the fat must be scraped off the plates and put into alcohol; the odour then leaves the grease and enters into the spirit, which thus becomes 'scent,' and the grease again becomes odourless.

The flower farmers of the Var follow precisely this method on a very large scale, with but a little practical variation, with the following flowers—rose, orange, acacia, violet, jasmine, tuberose, and jonquil. The process is termed *enfleurage*. In the valley of the Var, there are acres of jasmine, of tuberose, of violets, and the other flowers named; in due season the air is laden with fragrance, the flower harvest is at hand. Women and children gather the blossoms, which they place in little panniers like fishermen's baskets hung over the shoulders. They are then carried to the laboratory of flowers and weighed. In the laboratory the harvest of flowers has been anticipated. During the previous winter great quantities of grease, lard, and beef-suet have been collected, melted, washed, and clarified. In each laboratory there are several thousand *châssis* (sashes), or framed glasses, upon which the grease to be scented is spread, and upon this grease the blossoms are sprinkled or laid. The *châsse en verre* is, in fact, a frame with a glass in it as near as possible like a window-sash, only that the frame is two inches thicker, so that when one *châsse* is placed on another, there is a space of four inches between every two glasses, thus allowing space for blossoms. The illustration shews the *châsse* with grease and flowers upon it (fig. 1), also a pile of the same as in use. The flower blossoms are changed every day, or every other day, as is convenient in regard to the general work of the laboratory or flowering of the plants. The same grease, however, remains in the *châsse* so long as the particular plant being used yields blossoms. Each time the fresh flowers are put on, the grease is 'worked'—that is, serrated with a knife—so as to offer a fresh surface of grease to absorb odour. The grease being *enfleurée* in this way for three weeks or more—in fact, so long as the plants produce blossoms—is at last scraped off the *châsse*, melted, strained, and poured into tin canisters, and is now fit for exportation. Fat or oil is perfumed with these same flowers by the process of maceration; that is, infusion of the flowers in oil or melted fat. For this end, purified fat is melted in a *bain marie*, or warm bath, and the fresh

* *Art of Perfumery*, by Septimus Piesse, Ph.D., 8vo 50 cuts. Longman.

blossoms are infused in it for several hours. Fresh flowers being procured, the spent blossoms are strained away, and new flowers added repeatedly, so long as they can be procured. The *bain marie* is used in order to prevent the grease becoming too

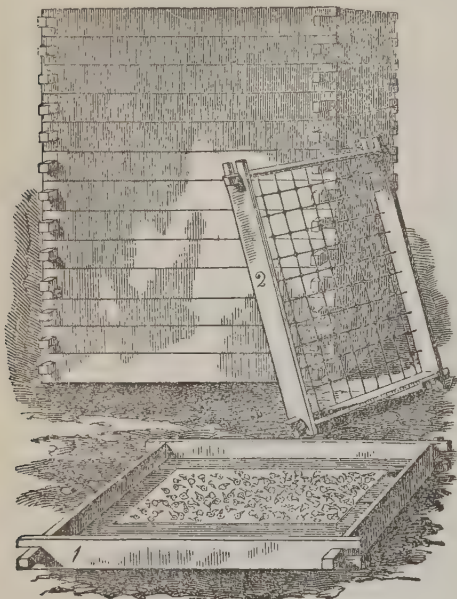

Fig. 1.

hot from exposure to the naked fire; so long as the grease is fluid, it is warm enough. Oil does not require to be warmed, but improved results are obtained when it is slightly heated.

Jasmine and tuberose produce best perfumed grease by enfleurage, but rose, orange, and acacia

maceration. In the engraving a *châsse en fer* (2, fig. 1) is shewn; this is for enfleurage of oil. In the place of glass, the space is filled with a wire net; on which is laid a *molleton*, or thick cotton fabric—moleskin, soaked with oil; on this the flowers are laid, just as with solid grease. In due time—that is, after repeated changing of the flowers—the oil becomes fragrant, and it is then pressed out of the moleskin cloth. Oil of jasmine, tuberose, &c., are prepared in this way. In order now to obtain the perfume of these flowers in the form used for scenting handkerchiefs, we have only to infuse the scented fat or oil, made by any of the above methods, in strong alcohol.

In extracting the odour from solid fat it has to be chopped up fine as suet is chopped, put into the spirit, and left to infuse for about a month. In the case of scented oil it has to be repeatedly agitated with the spirit. The result is, that the spirit extracts all the odour, becoming itself 'perfume,' while the grease again becomes odourless; thus are produced the essence of jasmine, essence of orange flowers, essence of violets, and others already named, rose, tuberose, acacia, and jonquil.

It is remarkable that these flowers yield perfumes which, either separate or mixed in various proportions, are the types of nearly all flower odours; thus, when jasmine and orange flowers are blended, the scent produced is like sweet-pea; when jasmine and tuberose are mixed, the perfume is that of the hyacinth. Violet and tuberose resemble lily of the valley. All the various bouquets and nosegays, such as 'frangipanni,' 'white roses,' 'sweet daphne,' are made upon this principle.

The commercial importance of this branch of perfumes may be indicated by the quantity of flowers annually grown in the district of the Var. Flower Harvest: orange blossoms, 1,475,000 lbs.; roses, 530,000 lbs.; jasmine, 100,000 lbs.; violets, 75,000 lbs.; acacia, 45,000 lbs.; geranium, 30,000 lbs.; tuberose, 24,000 lbs.; jonquil, 5000 lbs.

CLASS IV. Perfumes of animal origin.—The principal are Musk (q. v.), Ambergris (q. v.), Civet (q. v.), and Castor (q. v.). The aroma of musk is the most universally admired of all perfumes; it freely imparts odour to every body with which it is in contact. Its power to impart odour is such, that polished steel will become fragrant if it the metal be shut in a box where there is musk, contact not being necessary.

In perfumery manufacture, musk is mixed with other odorous bodies to give permanence to a scent. The usual statement as to the length of time that musk continues to give out odour has been called in question. If fine musk be spread in thin layers upon any surface, and fully exposed to a changing current of air, all fragrance, it is said, will be gone in from six to twelve months.

Civet is exceedingly potent as an odour, and when pure, and smelled at in the bulk of an ounce or so, is utterly insupportable from its nauseousness; in this respect it exceeds musk. When, however, civet is diluted so as to offer but minute quantities to the olfactory, then its perfume is generally admitted; this is also the case with gas-tar; but the fragrant principle is the same as that exhaled by the beautiful narcissus. Castor is in our day almost obsolete as a perfume.

The average consumption of musk in Britain for 1860—1865 was 7810 ounces, value £8545. Average importation for the years 1860—1865: otto of roses, 1117 ounces, value £13,561; vanilla, 3525 pounds, value £12,568; ambergris, 225 ounces, value £225; civet, 355 ounces, value £300; orris root, 420 hundredweight

give more satisfactory products by maceration; while violet and jonquil grease is best obtained by the joint processes—enfleurage followed by

The value of musk entering into consumption in the U. States, in 1870, was \$6935; civet, \$454; of cologne water and other alcoholic perfumery, 10,232 galls., valued at \$177,003; other perfumery, &c., not specified, valued at \$136,720. See Mad. Celnart on *Perfumery*, translated by C. Morfit, Phila.; Pradal and Malpeyne, *A Complete Treatise on Perfumery*, trans. by H. Dussance, Phila., 1864; E. Rimmell, *Book of Perfumes*, 4th ed., Lond., 1864; *A Practical Guide for the Perfumer*, by Debey, Lunel, Dussance, &c.

PERGAMUS, or **PERGAMUM**, anciently a city of Mysia in Asia Minor, on the navigable river Caicus, at the distance of 120 stadia from the sea. According to tradition, the place was of Greek origin, but its early history is quite insignificant. It first acquired prominence when Lysimachus, one of Alexander's generals, chose it as a stronghold in which to keep his treasures. Under Philetærus it became the capital of a state, 283 B.C. His successor, Eumenes I., maintained its independence against the Seleucidae, although the title of king was first assumed by Attalus I., who reigned from 241 to 197 B.C. He intimately allied himself with the Romans against Philip of Macedon, and this alliance subsisted throughout succeeding reigns, in which the kingdom increased in extent and importance, till at last Attalus III., surnamed Philometer, who died in 133 B.C., left it with all his treasures to the Romans, who successfully maintained the right thus acquired, and under whom the city continued to flourish. It was the focus of all the great military and commercial routes of Asia Minor, and Pliny describes it as *longe clarissimum Asiae Pergamum*. The Attali collected in P. a library only inferior to that of Alexandria. It was also the seat of a famous grammar-school, and it gave its name to Parchment (q. v.). P. sank under the Byzantine emperors, but the place still exists under the name *Bergamah*, and is noted for the splendour and magnificence of its ruins, which embrace temples, palaces, aqueducts, gymnasia, amphitheatres, and city walls.

PERGOLESE, GIOVANNI BATTISTA, an eminent musician of the Neapolitan school. Evidence regarding the date and place of his birth is conflicting; probably the correct account is that of the Marchese di Villarsosa, his latest biographer, who states that he was born at Jesi, near Ancona, on the 3d of January 1710. In 1717 he was admitted into the Conservatorio dei Poveri di Gesù Cristo at Naples, where he studied the violin under Domenico di Matteis, and musical composition under Gaetano Greco and Durante. Under the conviction that melody and taste were sacrificed to learning by most of the masters of his time, he abandoned the style of Scarlatti and Greco for that of Vinci and Hasse. His first great work was the oratorio of *San Guglielmo d'Aquitania*, composed in 1731. In that and the following year appeared his operas of *La Serva Padrona*, *Il Prigionier Superbo*, and *Lo Frate Innamorato*; in 1734, *Adriano in Siria*; in 1735, *Il Flaminio* and *L'Olimpiade*. In 1734, he received the appointment of *maestro di capella* of the Church of Loretto. In consequence of delicate health, he removed to Pozzuoli, where he composed the cantata of *Orfeo*, and his pathetic *Stabat Mater*. He died there of consumption in 1736. Besides the above-mentioned works, P. composed a number of pieces for the church, which were better appreciated during his lifetime than his secular compositions, also a violin concerto, and thirty trios for violin, violoncello, and harpsichord. His works are all characterised by sweetness and freedom of style.

PERI (Fairy), according to the mythical lore of the East, a being begotten by fallen spirits, which spends its life in all imaginable delights, is

immortal, but is for ever excluded from the joys of Paradise. It takes an intermediate place between angels and demons, and is either male or female. So far from there being only female Peris, as is supposed by some, and these the wives of the Devas, the Peris live, on the contrary, in constant warfare with these Devas. Otherwise, they are of the most innocuous character to mankind, and, exactly as the fairies, with whom our own popular mythology has made us familiar, are, when female, of surpassing beauty. One of the finest compliments to be paid to a Persian lady is to speak of her as *Perizadeh* (born of a Peri; Greek, *Parisatis*). They belong to the great family of *genii*, or *jin*: a belief in whom is enjoined in the Koran, and for whose conversion, as well as for that of man, Mohammed was sent (cf. Koran, chaps. lv., lxxii., and lxxiv.).

PERIAGUA, a large canoe composed of the trunks of two trees, hollowed and united into one fabric; whereas an ordinary canoe is formed of the body of one tree only. *Periaguas* are used in the Pacific, and were formerly employed among the West India Islands, whence the frequent allusion to them in *Robinson Crusoe*.

PERIANTH (Gr. *peri*, around, *anthos*, a flower), in Botany, the floral envelope (see **FLOWER**) of those plants in which the calyx and corolla are not easily distinguished. The term is convenient, as it can be applied indifferently to the calyx and corolla; thus, when there is either a calyx or corolla existing, but not both, the perianth is said to be *single*; when both are present, *double*. Both are really present in many endogenous plants, to which the use of the term perianth is confined by some botanists; the single floral envelope of exogenous plants being regarded as a calyx, and the corolla supposed to be wanting. The perianth is *regular* in some plants, *irregular* in others. It often displays great beauty, as in tulips, crocuses, lilies, &c.

PERICARDITIS, or Inflammation of the Pericardium (q. v.), is a disease of frequent occurrence; the result of a very large number of post-mortem examinations being to shew that about 1 in 23 of all who die at an adult age exhibits traces of recent or old attacks of this disorder.

For reasons which will be obvious when we come to speak of the physical signs of this disease, we shall commence with a notice of the anatomical changes which take place in the inflamed membrane. Very soon after symptoms of pericarditis begin to shew themselves there is an abnormal dryness of the serous membrane, which is speedily followed by an increased secretion of fluid. The secreted fluid is sometimes almost entirely fibrinous, in which case it coagulates, and gives rise to adhesions between the heart and the pericardium; or it may consist almost entirely of serum, which remains liquid; or it may be, and it most frequently is, a mixture of the two. When there is a large amount of liquid effusion (as, for instance, a third of a pint or more) which is not re-absorbed, death usually takes place in the course of a few days, in consequence of the interference of the fluid with the heart's actions; but when there is not much liquid effusion, or when the liquid part is absorbed, the pericardium becomes more or less adherent, and apparent recovery usually takes place.

In the cases that prove fatal when fibrinous fluid has been effused, but has not coagulated to such an extent as to cause complete adhesion of the heart to the pericardium, the partially coagulated fibrin (or lymph, as the older authors styled it) is seen to be of a yellowish-white colour, and to occur in a rugged, shaggy, or cellular form. Laennec compared the

surface on which the lymph is deposited to that which would be produced by suddenly separating two flat pieces of wood between which a thin layer of butter had been compressed. Dr Watson regards the appearance as more like the rough side of pieces of uncooked tripe than anything else; while others have compared it to lace-work, cut sponge, a honey-comb, a congeries of earthworms, &c. When the patient dies at a more advanced stage of the disease—viz., soon after the whole of the membrane has become adherent—incipient blood-vessels, in the form of red points and branching lines, are seen, indicating that organisation is commencing in the deposit, which if death had not ensued would have been finally converted into cellular or areolar tissue, and have occasioned the complete obliteration of the pericardial cavity.

The symptoms of pericarditis are pain in the situation of the heart, increased by a full inspiration, by pressure upon or between the ribs in the cardiac region, and especially by pressure upwards against the diaphragm by thrusting the fingers beneath the cartilages of the false ribs; palpitations; a dry cough and hurried respiration; discomfort or pain on lying on the left side; restlessness; great anxiety of countenance; and sometimes delirium. The pulse usually beats from 110 to 120 in a minute, and is sometimes intermittent; and febrile symptoms are always present. These symptoms are seldom collectively present in any individual case, and until the time of Louis the diagnosis of this disease was uncertain and obscure. The physical signs, dependent on the anatomical changes which have been described, are, however, generally so distinct that by their aid the disease can be readily detected. They are three in number. 1. In consequence of irritation propagated to the muscular tissue of the heart at the commencement of the inflammation of its investing membrane, the ventricles contract with increased force, rendering the sounds of the heart louder and its impulse stronger than in health, or than in the more advanced stages of the disease. 2. When much fluid is effused into the pericardium, dulness on percussion is always observable to a greater degree than in health. This sign, which is very characteristic, is seldom perceived till the disease has continued for two or three days. In relation to this increased dulness, we must premise that in the healthy condition of the heart and lungs there is an irregular roundish space with a diameter of somewhat less than two inches, extending from the sternum (or breast-bone) between the level of the fourth and fifth ribs towards the left nipple, in which a portion of the surface of the heart is not overlapped by the lungs, but lies in contact with the walls of the chest. This space should normally be dull on percussion. In pericarditis the extent of the dulness beyond the normal limit indicates the amount of effusion. In extreme cases the dulness may extend over a space whose diameter is seven inches or more. Simultaneous with the increased dulness, there is a diminution of the heart's sounds in consequence of the intervening fluid, and the impulse is often scarcely perceptible. 3. The rubbing of the inflamed and roughened surfaces upon each other gives rise to a sound which is commonly called the *friction sound*, but which has received various names. Thus Dr Watson calls it a *to and fro* sound, and observes regarding its variations that, 'like all the other morbid sounds heard within the chest, it is capable of much variety in tone and degree. Sometimes it very closely resembles the noise made by a saw in cutting through a board; sometimes it is more like that occasioned by the action of a file or of a rasp; but its essential character is that of *alternate rubbing*; it is a *to and fro*

sound.' This sound is heard early in the disease, before the surfaces of the pericardium are separated by the effusion of fluid; and it is due either to the dryness of the membrane, or to its roughness from the deposition of lymph. When the contiguous surfaces are either separated by fluid, or become adherent, the sound disappears; but when it has been lost from the first of these causes, it reappears after the fluid has been so far absorbed as to permit the surfaces again to come in contact. But here, again, its duration is brief, for the surfaces soon become adherent and cease to rub upon each other.

Pericarditis is a disease which occasionally runs a very rapid course, and terminates fatally in forty-eight hours or less. In ordinary cases, however, which terminate in apparent recovery, the disease generally begins to yield in a week or ten days, and excepting that adhesion remains, the cure appears to be complete in three weeks or less. But although these patients *apparently* recover, the pericardial adhesion commonly occasions other structural changes of the heart sooner or later to develop themselves; and in those cases that the physician has the opportunity of subsequently watching, it is observed that fatal disease of the heart, primarily due to the pericarditis, almost always supervenes. In slight cases it is probable that a true cure, without adhesion, may take place.

Pericarditis frequently arises from exposure to cold when the body is warm and perspiring. It is no uncommon result of a contaminated state of the blood, such as occurs in the exanthematous diseases, especially scarlatina, and in Bright's disease of the kidney; but beyond all comparison, it is of most frequent occurrence in association with acute Rheumatism (q. v.), of which it forms by far the most dangerous complication.

At the commencement of the disease, blood should be freely taken (if the patient is tolerably robust) from the region of the heart either by cupping or repeated leeching; and at the same time every attempt must be made to get the system under the influence of mercury to the extent of rendering the gums tender and of affecting the breath. Not only should calomel in small doses, and combined with opium with the view of preventing purging, be frequently given, but mercurial ointment should be rubbed into the arm-pits and inner sides of the thighs, and the mouth should be kept slightly sore for some time. After three or four days, if there should be much fluid effusion, a large blister should be applied over the heart; and if the patient is not already under the influence of mercury, the raw surface may be dressed with mercurial ointment. Perfect rest both of body and mind is of essential importance, and all possible causes of excitement should be excluded. The diet should be mild and chiefly farinaceous, and little or no animal food should be allowed till the beginning of convalescence. Cooling drinks are agreeable to the patient, and may be taken freely with advantage throughout the disease.

PERICARDIUM, THE, is a conical membranous sac, containing the heart and the commencement of the great vessels, to the extent of about two inches from their origin. It is placed with its apex upwards behind the sternum, and to its left side, in the interval between the pleuræ—the serous sacs in which the lungs are enclosed; while its base is attached to the diaphragm. It is a fibro-serous membrane, consisting of an external fibrous and an internal serous layer. The fibrous layer is a strong, dense, fibrous membrane; the serous layer invests the heart, and is then reflected on the inner surface of the fibrous layer. Like all serous membranes, it is a closed sac; its inner surface is smooth and

glistening, and secretes a thin fluid which serves to facilitate the natural movements of the heart. It is inflammation of this serous sac which constitutes the disease known as pericarditis.

PERICARP. See **FRUIT**.

PERICLES (Gr. **PERIKLES**), the most accomplished statesman of ancient Greece, was born of distinguished parentage in the early part of the 5th c. B.C. His father was that Xanthippus who won the victory over the Persians at Mycale, 479 B.C., and his mother, Agariste, was the niece of the great Athenian reformer Cleisthenes. P. received an elaborate education; but of all his teachers, the one whom he most revered, and from whose instructions he derived most benefit, was the philosopher Anaxagoras (q. v.). P. was conspicuous all through his career for the singular dignity of his manners, the 'Olympian' thunder of his eloquence, his sagacity, probity, and profound Athenian patriotism. When he entered on public life, Aristides had only recently died, Themistocles was an exile, and Cimon was fighting the battles of his country abroad. Although the family to which he belonged was good, it did not rank among the first in point of either wealth or influence, yet so transcendent were the abilities of P., that he rapidly rose to the highest power in the state as the leader of the dominant democracy. The sincerity of his attachment to the 'popular' party has been questioned, but without the shadow of evidence. At any rate, the measures which either personally or through his adherents he brought forward and caused to be passed, were always in favour of extending the privileges of the poorer class of the citizens. P. seems to have grasped very clearly, and to have held as firmly, the modern 'radical' idea, that as the state is supported by the taxation of the body of the citizens, it must govern with a view to general and not to *caste* interests. In 461 B.C., P., through the agency of his follower, Ephialtes, struck a great blow at the influence of the oligarchy, by causing the decree to be passed which deprived the Areopagus of its most important political powers. Shortly after, the democracy obtained another triumph in the ostracism of Cimon. During the next few years the political course pursued by P. is not very clearly discernible, but in general his attitude was hostile to the desire for foreign conquest or territorial aggrandisement, so prevalent among his ambitious fellow-citizens. In 454 B.C., or shortly after, he magnanimously proposed the measure (which was carried) for the recall of Cimon, and about the same time commenced negotiations with the other Hellenic states with the view of forming a grand Hellenic confederation, the design of which was to put an end to the mutually destructive wars of kindred peoples—to make of Greece one mighty nation, fit to front the outlying world. The idea was not less sagacious than noble. Had it been accomplished, the semi-barbarous Macedonians would have menaced the civilised Greeks in vain, and even Rome at a later period might perhaps have found the Adriatic, and not the Euphrates, the limits of her empire. But the Spartan aristocrats were utterly incapable of morally appreciating such exalted patriotism, or of understanding the political necessity for it, and by their secret intrigues brought the well-planned scheme to naught. Athens and Sparta were already, and indeed had for some time been, in that mood towards each other which rendered the future Peloponnesian war inevitable. They are always found on opposite sides. When the Spartans, in 448 B.C., restored to the Delphians the guardianship of the temple and treasures of Delphi, of which they had been

deprived by the Phocians, the Athenians immediately after marched an army thither, and reinstated the latter. Three years later, an insurrection broke out in the territories tributary to Athens, Megara, Eubœa, &c., and the Spartans again appeared in the field as the allies of the insurgents. The position of Athens was critical. P. wisely declined to fight against all his enemies at once. A bribe of ten talents sent the Spartans home, and the insurgents were then rapidly and thoroughly crushed.

Cimon was now dead, and was succeeded in the leadership of the aristocratical party by Thucydides, son of Milesias, who in 444 B.C. made a strong effort to overthrow the supremacy of P. by attacking him in the popular assembly for squandering the public money on buildings, and in festivals and amusements. Thucydides made an effective speech; but P. immediately rose and offered to execute the buildings at his own expense, if the citizens would allow him to put his own name upon them instead of theirs. The sarcasm was successful, and P. was empowered to do as he pleased in the matter. But P. did not mean to be simply sarcastic; he wished to point out to the Athenians in a delicate way the spirit and aim of his policy, which was to make Athens, as a city, worthy of being the head and crown of Hellas. His victory in the assembly was followed by the ostracism of Thucydides; and during the rest of his career 'there was,' says the historian Thucydides, 'in name a democracy, but in reality a government in the hands of the first man.' The same author, however, informs us that he never did anything unworthy of his high position; that he did not flatter the people, or oppress his adversaries; and that with all his unlimited command of the public purse, he was personally incorruptible. Soon after this the Samian war broke out, in which P. acquired high renown as a naval commander. This war originated in a quarrel between the Milesians and Samians, in which Athens was led to take a part with the former. The Samians, after an obstinate struggle, were beaten, and a peace was concluded in 440 B.C. The position in which Athens then stood towards many of the Greek states was peculiar. Since the time of the Persian invasion she had been the leader of the confederacy formed to resist the attacks of the powerful enemy, and the guardian of the confederate treasury kept in the isle of Delos. P. got the treasury removed to Athens, and, commuting the contingents of the allies for money—Athens, of course, herself undertaking to protect the confederacy—enormously increased the contributions to the 'patriotic fund.' The grand charge against P. is, that he applied the money thus obtained to other purposes than those for which it was designed; that, in short, he adorned and enriched Athens with the spoils of the allied states. But the objection is more plausible than solid, for, in point of fact, Athens kept up in admirable discipline a great fleet and a fine army, and P. made the Greek name more respected in his time than it had ever been before. It may be that his conduct is open to criticism in some respects, but a broad and just view of the motives which impelled him to act as he did, and a fair consideration of the political exigencies of the time will, in the main, justify his procedure. It is unnecessary to give a detailed account of all that he did to make his native city the most glorious in the ancient world. Greek architecture and sculpture, under his patronage, reached perfection. To P., Athens owed the Parthenon, the Propylæa, the Odeum, and numberless other public and sacred edifices; he also liberally encouraged music and the drama;

and, during his rule, industry and commerce were in so flourishing a condition, that prosperity was universal in Attica.

At length, in 431 B.C., the long-foreseen and inevitable 'Peloponnesian war' broke out between Athens and Sparta. With the circumstances that led to it we have not here to do, but as it terminated most disastrously for Athens, it is but right to say that P. is not to blame for the result. Had the policy which he recommended been pursued, one can hardly doubt that Athens, with her immense resources, would have been the victor, and not the vanquished, in the struggle. P. himself died in the autumn of 429 B.C., after a lingering sickness. His character has been sufficiently delineated in the outline of his life which we have given. His connection with the brilliant Aspasia (q. v.) is noticed elsewhere.

PERIER, CASIMIR, a celebrated French statesman, was born at Grenoble, in the department of Isère, France, 21st October 1777. His father had enriched himself by mercantile and industrial pursuits, into which he initiated his two elder sons; but Casimir was still studying at the college of the Oratory at Lyon when the revolution broke out. He immediately went to Paris, and there associated himself with his father and elder brother Antoine-Scipion in their endeavours to found a banking company. It is sufficient to notice here that the banking company was firmly established, and became the Bank of France. Casimir was drafted into the army in 1798, and served in an engineering corps till 1801, when he returned to Paris, and resumed the position of coadjutor to his brother. The house of P. prospered greatly under the empire; the peace which followed the events of 1815 aided the development of their plans, and gave a wider scope to their enterprises; and the public regarded with special favour men such as these two brothers, who devoted their abilities and fortunes to foster the growth of public, as well as their own, prosperity. In 1817, P. published three tracts, in which he condemned the financial policy of the ministry. These papers made a lively impression on the public, and led to the return of the author to the Chamber of Deputies by the electors of Paris. P., in his political principles, was essentially a Constitutionalist, equally far removed from absolutism on the one hand, and extreme democracy on the other. The elections of 1824, conducted under government influence, resulted in the ousting of the greater portion of the Constitutionals. P., however, and a few others of the chiefs of the party retained their seats; but their opposition to the ministerial measures, though constant and unwearying, was quite ineffective; it, however, raised them greatly in public opinion, and secured their re-election in 1827. In this year, P. had the honour of being elected as representative by both the departments of the Seine and Aube. He defended the loyal and sagacious administration of M. de Martignac, whose representations to the king, Charles X., seemed to have the effect of reconciling the royal party to government in conformity with the charter; but the subsequent rule of the Prince de Polignac reduced this hopeful state of affairs to its former critical condition. The revolution (of July 1830), which P., from his experience of that of 1789, had made every endeavour to prevent, now followed, and it only remained for him to render it as bloodless as possible. In this he was successful, through his great influence with the people of Paris. On August 3, he was elected President of the Chamber of Deputies, but resigned this office on the 11th of the same month to become a member of the ministry. When Laffitte became

President of the Council (November 2), P., fearing that the tendencies of the ministry were too revolutionary, resigned office, and resumed the presidency of the Chamber of Deputies. On 13th March 1831, he succeeded Laffitte as minister, and gave his whole attention to the repression of revolution, the maintenance of order at home and of peace abroad, originating the political system known as the *juste-milieu* (q. v.). His foreign policy was very successful; he greatly contributed to the maintenance of Belgian independence, the suppression of the Miguelite insurrection in Portugal, the counterbalancing of Austrian influence in Italy, and, in general, to the spread and progress of constitutional liberty both at home and abroad; but the rapid growth of extreme liberalism in France, partly owing to previous encouragement unwittingly afforded by himself, was a source of great annoyance to him. On the outbreak of cholera in Paris, March 1832, P. made the most extraordinary exertions for the enforcement of the necessary sanitary measures; but he was attacked by the disease, and his system being already exhausted by over-exertion, he died, 16th May 1832. No public man in France was ever so generally and sincerely lamented, and a monument to his memory was erected by public subscription in the cemetery of Père-la-Chaise.

PERIGEE (Gr. *peri*, near; *gē*, earth), that point in the moon's orbit which is nearest to the earth. The opposite point is the Apogee (q. v.). See Moon.

PÉRIGUEUX, a town of France, capital of the department of Dordogne, and situated on the right bank of the Isle, 68 miles east-north-east of Bordeaux. It consists of the ancient city of P. Proper—which is gloomy in aspect, and has narrow streets, but large and solidly-built houses—and the *Puy St Front*, which, until the year 1240, was a separate and a rival town. In the old town, there are many curious remains of Gothic architecture. The old ramparts have been demolished, and replaced by beautiful and spacious boulevards. The cathedral of St Front is a majestic edifice, restored at the end of the 15th century. Quarries of building-stone are worked in the vicinity, and many hands are employed in cutting and polishing marble. Paper, woollen cloths, cutlery, and hosiery are manufactured. The celebrated *Pâtés de Périgueux*, made of partridges and truffles, are largely made and exported. Pop. 19,140.

P., a town of the highest antiquity, is the *Vesunna* mentioned by Cæsar. In ancient times, it was a city of much importance. It stood at the junction of five Roman roads, and contained a number of splendid edifices. Close to the modern town are still to be seen the remains of a vast amphitheatre, oval in form, and larger in its dimensions than the ancient amphitheatre of Nîmes. There are also remains of ancient aqueducts, baths, and temples. The *Tour de Vésonne* is the most remarkable fragment of Roman architecture. It is still 67 feet high, and appears to have been much higher; is 200 feet in circumference, and has walls 6 feet thick. It has neither doors nor windows. Its purpose is not known.

PERIHELION (Gr. *peri*, and *hēlios*, the sun), that point in its orbit at which a planet is nearest the sun. The point of the orbit opposite to it is called the Aphelion (q. v.). The position of the perihelion, i. e., its longitude east or west of the equinox, is one of the seven elements of a planet's orbit.

PERIM, a small island belonging to Great Britain, situated in the strait of Bab-el-Mandeb, at the entrance to the Red Sea. Lat. of southern

point $12^{\circ} 38' N.$, long. $43^{\circ} 12' E.$ It is $3\frac{1}{2}$ miles long by $2\frac{1}{2}$ broad; is about a mile distant from the Arabian, and about 13 miles from the African coast. On both sides of this island, the navigation is easy; the Little Strait, between the island and Arabia, is the passage most generally taken by vessels. The island is bare, destitute of fresh water, and ill-furnished with provisions, which are brought for the most part from Aden. P. owes its importance wholly to its commanding position at the entrance of the Red Sea. On its south-west side is an excellent harbour, $1\frac{1}{2}$ miles in length, and from a half to three-quarters of a mile in breadth. It is easy of access, 7 to 8 fathoms in depth, and is capable of accommodating forty men-of-war. Fortifications have been erected on the island since 1857, and the guns command the strait on both sides. It was first occupied by the English in 1799, and held by them as a check upon the designs of the French, who were then in Egypt. It was abandoned in 1801, but was reoccupied by Great Britain, February 1, 1857, with a view to the protection of her Indian possessions, which were thought to be exposed to some chance of danger from the opening of the Suez Canal (q. v.).

PERIMETER (Gr. *peri*, around, *metron*, a measure) and **PERIPHERY** (Gr. *phero*, I carry) are terms denoting the boundary, or the length of the boundary, of any closed plane figure; though the term 'perimeter' is generally confined to those figures which are bounded by straight lines.

PERIOD, a term used in Chronology in the same sense as Cycle (q. v.), to denote an interval of time after which the astronomical phenomena to which it refers recur in the same order. It is also employed to signify a cycle of cycles. Various periods have been invented by astronomers, but we can only notice a few of the most important.

The Chaldeans invented the *Chaldeic Period*, or *Period of Eclipses*, from observing that, after a certain number of revolutions of the moon round the earth, her eclipses recurred in the same order and of the same magnitude. This period consists of 223 lunations, or 6798.23 days, and corresponds almost exactly to a complete revolution of the moon's node. The Egyptians made use of the *Dog-star*, *Siriaca*, or *Sothric Period*, as it is variously called, to compare their civil year of 365 days with the true or Julian year of $365\frac{1}{4}$ days. The period consequently consisted of 1460 Julian years, corresponding to 1461 Egyptian years, after the lapse of which the dates in both reckonings coincided. By comparing the solar and lunar years, Meton, an Athenian, invented (432 B. C.) a lunar period of 6940 days, called from him the *Metonic Cycle* (q. v.), also the *Lunar Cycle*. About a century afterwards, the cycle of Meton was discovered to be an insufficient approximation to the truth, and as he had made the solar year too long by about $\frac{1}{8}$ th of a day, at the end of 4 Metonic cycles the solar reckoning was in advance of the lunar by about 1 day 6 hours. To remedy this, a new period, called the *Calippic Period*, was invented by Calippus, and consisted of 4 Metonic cycles less by 1 day, or 27,759 days. But as this period still gave a difference of 6 hours between the solar and lunar reckonings, it was improved by Hipparchus, who invented the *Hipparchic Period* of 4 Calippic periods less by 1 day, or 111,035 days, or about 304 Julian years, which is an exceedingly close approximation, being only $6\frac{1}{2}$ minutes too long, when measured by the tropical year; and too short but by an almost inappreciable quantity, when measured by the *Synodic Month* (see MONTH). The *period of the Heliacal or Solar Cycle*, after which the same

day of the month falls upon the same day of the week, consists of 28 Julian years. If the year had regularly consisted of 365 days, that is, one day more than an exact number of weeks, it is evident that, at the end of seven years, the days of the month and week would again correspond; but the introduction of an intercalary day into every fourth year causes this coincidence to recur at irregular periods of 6, 11, 6, and 5 years successively. However, by choosing a period such as will preserve the leap-years in the same relative position to the other years, and at the same time consist of an exact number of weeks (both of which objects are effected by using the number 28, which is the least common multiple of 4 and 7), we insure the *regular* recurrence of the coincidence between the days of the week and of the month. The solar cycle is supposed to have been invented about the time of the Council of Nice (325 A. D.), but it is arranged so that the first year of the first cycle corresponds to 9 B. C. In calculating the position of any year in the solar cycle, care must be taken to allow for the omission of the intercalary day at the beginning of each century, and its insertion in the first year of every fourth century. See LEAP-YEAR. The *Julian Period* is a cycle of cycles, and consists of $7980 (= 28 \times 19 \times 15)$ years, after the lapse of which the solar cycle, lunar cycle, and the Indiction (q. v.) commence together. The period of its commencement has been arranged so that it will expire at the same time as the other three periods from which it has been derived. The year 4713 B. C. is taken as the first year of the first period, consequently, 1 A. D. was the 4714th of it, and the year 1871 the 6584th.

PERIODICAL, a publication which appears continuously at regular intervals, and whose contents may be devoted to criticism, politics, religion, literature, science, arts, amusement, or general and miscellaneous subjects. Those periodicals which consist of a collection of critical essays are called *Reviews*.

The earliest periodical in Great Britain seems to have been the *Philosophical Transactions of the Royal Society*, which first appeared in 1665, and contained notices of books as well as original papers. Periodicals professing to notice the books that were being published appeared soon after from time to time under the name of *All the Works of the Learned*; and in 1692 appeared the *Gentlemen's Journal*, or *Monthly Miscellany*, properly speaking, the first English magazine. The *Gentleman's Magazine* was founded in 1731 by Cave the printer, a periodical which secured a fortune for its proprietor, and, after surviving all its competitors, still continues to flourish. The periodical literature of Scotland was long represented by the *Scots Magazine*, founded in 1739. The first English periodical that attempted anything like criticism was the *Monthly Review*, begun in 1749. It was followed in 1756 by the *Critical Review*, founded by Smollett; and these two were long the leading periodicals of their class, though their criticism was but meagre and unsatisfactory, according to our present notions. Another critical journal, called the *Anti-Jacobin*, was established in 1798. In 1802, a new era in criticism was inaugurated by the establishment in Scotland of the *Edinburgh Review* (q. v.); which was followed in London by the *Quarterly Review*, of about equal merit and opposite politics, supported by Sir Walter Scott, Southey, S. T. Coleridge, Heber, and at a later period by Hartley Coleridge, Lord Mahon, and Gladstone. Another very important periodical, *Blackwood's Magazine*, sprang up in Edinburgh in 1817, under the auspices of John Wilson and Lockhart, as much above the literary mark of former magazines, as the

Edinburgh and Quarterly were above the mark of preceding reviews, strongly devoted to the interests of conservatism, and, in its early years, somewhat violent in its politics. The review, in the course of time, became the favourite medium for all parties to disseminate their views on political, literary, or theological subjects. Among the most important periodicals of this class, besides the *Edinburgh and Quarterly*, are the *Westminster Review*, established 1824, characterised by freedom in handling philosophical and theological topics, and containing essays by J. S. Mill, Carlyle, Grote, John Sterling, and Lord Houghton; the *Dublin Review*, Roman Catholic, founded in 1836; the *North British Review*, which appeared in Edinburgh in 1844, and ceased in Jan. 1871; *British Q. Rev.*, begun 1845, organ of English non-conformity, and edited for 21 years by R. Vaughan; the *National Review*, in 1855; and the *Home and Foreign Review*, in 1862—1864. Most of these periodicals appear four times in the year. A few reviews have of late appeared monthly or even weekly: of this last class, the most widely-circulated and influential are the *Athenæum*, established in 1828, the *Saturday Review*, in 1856, the *Contemporary Review*, and the *Fortnightly Review*. The management of a review is placed in the hands of an editor. Each article has at its head the title of a work or works, which either are directly the subject of the reviewer's criticism, or at least indicate the general subject of the article.

The greater part of magazines or periodicals of a more miscellaneous character appear monthly, and their system of management is somewhat similar to that of reviews; but the articles are generally shorter, the subjects more varied, consisting often of tales and novels, which appear there as serials, continued from number to number. Some of the most popular novels of the present day have first been published in magazines. *Blackwood* was the precursor of various monthly magazines of repute, the most important being *Fraser's Magazine*, established in 1830, which still preserves a high literary character. The usual price of these periodicals is 2s. 6d.; but in 1859 and 1860, several new magazines, *Mcmillan's Magazine*, the *Cornhill*, *Temple Bar*, *London Society*, and the *St James's Magazine*, were started at the cheaper price of a shilling, under favourable auspices. In Great Britain there are now many weekly periodicals, chiefly of an instructive and amusing kind, price from a penny to three-pence each. This class of publications received an impetus and proper direction by the issue of *Chambers's Journal* and the *Penny Magazine* of the 'Society for the Diffusion of Useful Knowledge' in 1832. To the first mentioned, which still exists, have since been added *All the Year Round*, conducted by Charles Dickens, and various others enjoying a high degree of popularity. It is customary for the publishers of these weekly sheets to issue them accumulatively in parts monthly under a cover, wherefore they largely answer the purpose of monthly magazines. The rate of payment for writing in the higher class reviews is usually £10, 10s. per sheet of 16 demy 8vo pages; in the weekly periodicals, half a guinea to a guinea per column is ordinarily paid, but in some instances the price paid is very much greater; such particularly is the case as regards novels or stories, given chapter by chapter, through a series of numbers; for some tales in this form the payment amounts to hundreds, if not thousands of pounds—a striking proof of the eager demand for sensational fiction.

In 1868, there were in the United Kingdom 74 quarterly periodicals, of which hardly more than 16 come under the common idea of a review; many are devoted

to special departments, literary, scientific, commercial, or theological; and some consist of an account of the transactions of particular societies, literary or scientific. In 1868 there were 367 monthly magazines of all descriptions, having an average sale of 2000 copies.

France possessed as far back as 1665 a critical review called the *Journal des Savants*, which, after a lengthened interruption, began again in 1816, and holds a respectable position as a scientific journal. A number of literary and scientific journals sprang up in last century, as the *Nouveau Journal des Savants*, *Journal Littéraire*, *Journal Encyclopédique*, &c. Among the best was the *Magasin Encyclopédique*, begun in 1795, and from 1819 to 1835, combined with the *Revue Encyclopédique*. One of the most noted critical journals in Europe is published in Paris, the *Revue des Deux Mondes*, which began in 1829, and has, since 1831, appeared fortnightly. In it and the other French periodicals of the same kind, the review form is not so completely preserved as with us: a proportion of tales, poetry, &c., is admitted, and the names of the contributors are required to be attached to their articles. The *Revue des Deux Mondes* has had many short-lived imitators, more or less identified with different political parties. The principal French reviews of more recent date are the *Revue Contemporaine*, *Athenæum Français*, and *Revue d'Europe*.

In Germany, reviews have taken even a deeper root than in England. The *Göttinger Gelehrte Anzeige*, which is the oldest publication of the kind, still preserves a high character. German criticism can, however, hardly be said to have begun before the time of Lessing, who, in conjunction with Nicolai of Berlin, established, in 1757, the *Bibliothek der schönen Wissenschaften*, and afterwards various other journals, characterised by an independence of thought unknown before. The *Allgemeine Literaturzeitung*, founded at Jena in 1785, was a periodical of a still higher character, having for contributors the most eminent literary men of the period. When transferred from Jena to Halle, another journal, called the *Jenaische Allgemeine Literaturzeitung*, sprung up at the former place, under the auspices of the celebrated literary circle at Weimar, of whom Goethe was the centre. These two periodicals existed till 1848. Of modern German reviews, the *Literarische Centralblatt*, founded in 1850, is one of the best and most comprehensive. Among periodicals which do not come under the class of reviews, may be mentioned *Das Deutsche Museum* (1851), and *Das Weimarsche Jahrbuch für Deutsche Sprache, Literatur und Kunst*, may be favourably named.

Italy possessed a critical journal, *Giornale dei Letterati*, as far back as 1710, conducted by Apostolo Zeno, which continued for 23 years. A new journal of the same name, founded at Pisa in 1771, attained considerable repute. From 1826 to 1830, the *Biblioteca Italiana* and *Antologia di Firenze*, were reviews of considerable ability. The scientific periodicals of Italy are generally creditable. In the dominions of Victor Emmanuel, there were in 1864, 31 literary and scientific, and 10 miscellaneous periodicals.

The United States of America possess a large variety of periodicals, quarterly and monthly, and in a less degree weekly, issuing chiefly from the presses of Boston, New York, and Philadelphia. The most noted critical journal is the *North American Review*, established in 1815. Several sectarian journals, entitled reviews, have been issued of late years, among which are the *Presbyterian and Theological Review*, *Baptist Quarterly*, *Methodist Quarterly*, *Church Review*, &c. The more important literary monthlies are the *Atlantic Monthly*, *The Galaxy*, *Harper's Monthly*, *Lippincott's Magazine*, *The Overland*, and com-

pilations from periodicals of British, French, and German origin. For a list of periodicals in the U. States, see NEWSPAPERS. Latterly, as is well known, many of the periodicals, both of Europe and America, have acquired an interest by the introduction of wood-engravings, on the preparation of which large sums are expended. See WOOD-ENGRAVING.

PERIODICITY (in Physiology and Pathology). The tendency manifested by various phenomena occurring in living animals to recur, after equal, or nearly equal intervals of time, is so marked, that Bichat, the great French anatomist and physiologist, described it under the title of the *Loi d'Intermittence*. The alternation of sleep and waking, the phenomena of menstruation, and the punctual return of hunger, are some of the most obvious instances of periodicity that can be suggested as occurring in the healthy subject; while less obvious examples are afforded by the apparently regular variations that have been observed in the excretion of carbonic acid from the lungs, and in the number of the pulsations of the heart at different periods of the 24 hours. As is well known by experience, periodicity may be usefully cultivated and fixed in daily habits. This is well exemplified in the case of sleep, but in a more special degree by the daily relieving of the bowels at a particular hour, a habit in which it is important that all young persons should be carefully instructed with a view to health and convenience.

In certain forms of disease, the law of periodicity or intermission is very distinctly seen. The regular periodic recurrence of the paroxysms of intermittent fever (or ague), is universally known, although the cause of the periodicity has hitherto baffled all inquiry. Amongst those who have tried to solve this question may be mentioned Willis, Reil, Bailly, Roche, Cullen (who ascribes periodicity to 'a diurnal revolution affecting the animal economy'), and more recently, Laycock, who refers it to the diurnal atmospheric changes in relation to pressure, electricity, &c.

Ague often gives rise to periodic diseases which present no close analogy to that disease. Thus it—or, at all events, malaria—is a frequent cause of tic douloureux, recurring at regular intervals; cases are recorded in which periodical vomiting, occurring weekly, or, in one case, at an interval of ten days, seemed to be due to it; and Mr Moore, surgeon to the Middlesex Hospital, has recently published the case of a woman who experienced a periodical inflammatory swelling of the right knee, as a sequence of that disorder. Epilepsy is a disease in which the intervals (especially in women) tend to a regular period. Sir Henry Holland (*Medical Notes and Reflections*, 2d ed., page 341) records a case in which 'six attacks occurred, with intervals of sixteen or eighteen minutes between; so exactly recurring, as noted by the watch, that it was impossible to suppose it a mere casualty;' and another, 'where a spasmodic seizure, more of tetanic than epileptic character, occurred twice a day for many weeks successively, and almost exactly at the same hours each day.' For many other examples of periodic or intermittent morbid action, the reader is referred to a memoir by Henle, 'On the Course and Periodicity of Disease,' in his *Pathologische Untersuchungen*; and to Sir Henry Holland's essay (to which we have already referred) in his *Medical Notes and Reflections*. The most important practical fact in relation to this class of diseases is, that they almost invariably yield to the action of certain medicines, especially bark and arsenic.

Exercising a beneficial or mischievous influence, as the case may be, the habit of periodicity is to be sedulously shunned in every instance likely to prove morally or physically prejudicial. No more marked

example of the injudicious cultivation of periodicity could be given, than in the evil practice of periodical blood-letting, which once prevailed all over Europe, and was only abandoned in recent times as not only useless, but in all respects injurious.

PERI'ECI (Gr. *Periœkoi*, literally, 'dwellers round about,' i.e., round about 'some particular locality or city') was the name given, in ancient Greece, to the original Achaian inhabitants of Laconia by their Dorian conquerors. The P. were not slaves, like the Helots (q. v.); they were merely a vassal population, personally free, cultivating their own ground, and carrying on most of the home and foreign trade of Laconia, but possessing no political rights, incapable of intermarrying with the Dorians of Sparta, or of holding important state-offices, and subjected to a land-tax in token of their dependent condition. They have been—as regards their political position—compared to the Saxons of England after the Norman conquest, and seldom has a historical parallel been so sound. The P. must have been very numerous, for they occupied at one time upwards of 100 cities, several of which were on the coast, whence the whole seaboard of Laconia bore the name of the *Periœkis*, and they produced capital sailors, which doubtless accounts for the anomalous fact of P. being occasionally invested with the command of the Spartan fleet. They also formed a part of the Spartan army. At the battle of Platea (479 B.C.), there were 10,000 P. present. These dependent Achæians were not, however, all on a dead level of vassalage; they lived in regularly organised communities, where the social distinctions of rank, refinement, and wealth were as marked as elsewhere. Xenophon speaks of 'accomplished and well-born gentlemen' (*kaloî k'agathoi*) among the P. serving as volunteers in the Spartan army; and such artists and men of culture as Lacedæmon produced, in all probability belonged to this class. P. also existed in the other Dorian communities of the Peloponnesus.

PERIO'STEUM (Gr. *peri*, around, and *osteon*, bone), a tough fibrous membrane which surrounds the various bones. It is highly vascular, and is the means by which the outer layers of the shafts and the greater part of the spongy portions of the bones are supplied with blood. 'From the internal surface of the periosteum also is produced a layer of soft blastema (or plastic fluid in which cells are developed), by means of which, additions are made to the exterior of the growing bones. The process of ossification going on in the inner part of this blastema, contributes to the thickness of the bone, while a fresh supply is continually being added to the exterior of the blastema, through the medium of the vessels of the periosteum.'—Humphry *On the Human Skeleton*, page 19. In young bones, this membrane is thick, and in consequence of the intervening blastema is very easily detached from the bone; but in the bones of the adult it is less thick and vascular, while its connection with the bone becomes closer, in consequence of the blastema being less; while in aged persons it is very thin, its vessels are scanty, and there is no blastema. Numerous experiments shew that the formation of bone is essentially due to the action of this membrane; and that, by transplanting detached portions of periosteum into muscular or other tissues, bony tissue is generated in those parts. In most cases in which this membrane has become detached in consequence of a wound or of disease, the exposed bone (except in the instance of the skull, which derives most of its nutrient matter from the dura mater) perishes; but this is

not invariably the case. Amongst its other offices, it serves, by isolating the bone from the surrounding tissues, to prevent the spread of disease from them to it. The shin-bone or tibia is thus indebted to the periosteum for its ordinary immunity, in cases of ulcer in that region. In those parts in which the bone is not so completely isolated from the surrounding tissues, as at the ends of the bones of the fingers and toes, inflammation of the soft parts not infrequently extends to the bony structure.

PERIOSTITIS, or **INFLAMMATION OF THE PERIOSTEUM**, generally occurs on the surface of thinly-covered bones, such as the tibia, clavicles, and cranial bones. Its chief causes are (1) a *sphilitic taint*, in which oval swellings, called *Nodes* (c. v.), are produced; (2) *rheumatism*; and (3) *scrofula*. In the two latter cases, there is a periosteal swelling around the whole circumference or surface of the bone. The affection, especially when due to the first or second of the above causes, is usually accompanied with considerable nocturnal pain. If the disease occurs in an acute form, it must be treated with leeches, fomentations, and the other ordinary antiphlogistic (or lowering) remedies. When it becomes chronic, the treatment must be mainly directed to the cause which has originated it. In almost all cases, the nocturnal pains are best relieved by somewhat large doses (five to ten grains) of iodide of potassium, taken three times a day on an empty stomach.

PERIPATE'TIC PHILOSOPHY, a designation of the philosophy of Aristotle (q. v.) and of his followers. It is of doubtful origin, being supposed to have been derived either from his custom of occasionally walking about (*peripatein*) during the delivery of his lectures, or from the place in which they were delivered having been a shaded walk of the Lyceum.

PERIPNEUMONIA, an inflammation of the membrane which invests the lungs, accompanied with general disturbance of the whole system; remarkably prevalent among horses in South Africa, in a zone from 20° to 27° S. lat. It is very fatal; and to its prevalence and virulence, Dr Livingstone is disposed to ascribe the fact that horses, although so abundant in the more northern parts of Africa, were unknown in the south till introduced by Europeans; this invisible barrier being more insurmountable than mountain ranges, deserts, or rivers. The season during which peripneumonia prevails is from December to April. Zebras, antelopes and oxen are liable to its attacks, but no kind of quadruped suffers so much from it as the horse. The flesh of animals which die of peripneumonia is unwholesome, and produces a malignant carbuncle in persons who eat it.

PERIPTERAL (Gr. *peri*, and *pteron*, a wing), a term applied to temples or like buildings having columns all round the cella.

PERISTALTIC MOTION. The terms *peristaltic* (Gr. *clasp* and *compress*) and *vermicular* (for worm-like) are applied to the peculiar motion or action of the muscular coat of the intestines, by which the substances contained within it are regularly moved onward.

This action of the intestines is readily seen on opening an animal (a dog, cat, or rabbit, for example) immediately after it has been killed; and in these circumstances, it is perhaps exaggerated, from the stimulating action of the cold air; and it may be shewn in an abnormally active state, although not altered in character, by subjecting the exposed intestines to the influence of the electro-magnetic machine.

It appears, from the observations made by Brinton,

Todd and Bowman, and others on recently killed animals, that the peristaltic motion commences at the pyloric third of the stomach (see **DIGESTION, ORGANS OF**), whence successive waves of contraction and relaxation are propagated downwards throughout the whole length of the intestinal canal. 'In examining a portion of intestine at the moment of its contraction, we perceive a dilatation above it as well as below it; the latter being produced by the protrusion into it of the contents of the now contracted portion of intestine; the former by the relaxation of a previously contracted portion. The rapid succession of these contractions and relaxations gives to the movements of the intestines the appearance of the writhings of a worm, whence they are distinguished by the appellation *vermicular*.'—Todd and Bowman's *Physical Anatomy of Man*, vol. ii. p. 236. These movements can occasionally be observed during life in the human subject, indirectly, in cases of extreme attenuation of the abdominal walls, and directly in wounds of the abdomen, and during certain surgical operations. There are differences of opinion as to the cause of the peristaltic action; thus, Todd and Bowman assert that 'the intestinal movements are partly due to the influence of the stimulus of distention upon the muscular tissue, and partly to the reflex action of the ganglia of the intestinal portion of the sympathetic, stimulated by the contact of the intestinal contents with the mucous membrane;' while Carpenter maintains that 'the intestinal tube from the stomach to the rectum is not dependent upon the nervous centres either for its contractility or for its power of exercising it, but is enabled to propel its contents by its own inherent powers.'

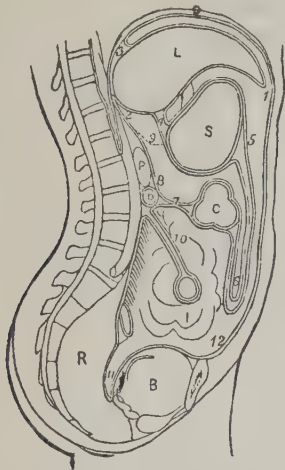

Numerous observations tend to shew that this motion has a nearly definite velocity in each individual. Most commonly the act of defecation takes place with perfect regularity every 24 or (more rarely) every 12 hours, the quantity discharged being almost constant, if the mode of living does not vary. Heberden (*Commentarii*, p. 14) mentions a person who regularly had a motion once a month, and (by way of contrast) another who had twelve motions every day during thirty years, and then seven every day for seven years, and rather grew fat than otherwise. Ponteau (*Œuvres Posthumes*, tome i. p. 27) records the case of a young lady who had no stool for upwards of eight years, although during the last year she ate abundantly of fruit, and drank coffee, milk, and tea, and broth with yolk of eggs; but she had copious greasy sweats. Such a case as this is possible, but far from probable.

That the influence of *expectant attention* on the muscular movements of the intestine (and especially of its lower portion) is very great, is shewn in various ways. It is, for the most part, thus that *habit* operates in producing a readiness for defecation at one special hour in the day, and that bread-pills and other equally inert substances act on the bowels, if the patient believes them to be purgatives. Dr Carpenter, in his remarks on 'the influence of expectant attention on muscular movements,' in the chapter of his *Human Physiology* treating 'Of Muscular Movements,' mentions two very striking cases of the kind which have fallen within his own knowledge.

PERISTYLE, a colonnade around the interior of a courtyard or other building.

PERITONEUM (Gr. *periteinein*, to extend around), a serous membrane, and like all membranes of this class, a shut sac, which, however, in the female, is not completely closed, as the Fallopian tubes communicate with it by their free extremities. The peritoneum more or less completely invests all the viscera lying in the abdominal and

pelvic cavities, and is then reflected upon the walls of the abdomen, so that there is a visceral and a parietal layer. Numerous folds are formed by the visceral layer as it passes from one organ to another. They serve to hold the parts in position, and at the same time enclose vessels and nerves. Some of these folds are termed *Ligaments*, from their serving to support the organs. Thus, we have ligaments of the liver, spleen, bladder, and uterus formed by peritoneal folds. Others are termed *Mesenteries* (from the Gr. *meson*, the middle, and *enteron*, the intestine), and connect the intestines with the vertebral column. They are the Mesentery proper (q. v.), which has been already described, the ascending,

The Reflections of the Peritoneum :

1, the diaphragm; S, the stomach; C, the transverse colon; D, the duodenum; P, the pancreas; I, the small intestine; R, the rectum; B, the urinary bladder; 1, the anterior, and 2, the posterior layer of peritoneum; 4, the lesser omentum; 5 and 6, the greater omentum; 7, the transverse mesocolon; 10, the mesentery encircling the small intestine; 11, the recto-vesical fold; 12, the anterior layer traced upwards upon the internal surface of the abdominal walls to the point (1) with which the examination commenced.—From Wilson's *Anatomist's Vade-mecum*.

transverse, and descending meso-colon, and the mesorectum. (The mesentery and transverse meso-colon are shewn in the figure.) Lastly, there are folds called *Omenta*, which proceed from one viscus to another. They are three in number—viz., the *Lesser* or *Gastro-hepatic Omentum*, which extends from the under-surface of the liver to the lesser curvature of the stomach (No. 4 in fig.); the *Gastro-splenic Omentum*; and the *Great* (or *Gastro-colic*) *Omentum* (Nos. 5 and 6 in fig.), which consists of four layers of peritoneum, the two which descend from the stomach, and the same two returning upon themselves, and ascending as high as the transverse colon, where they separate, and enclose that organ. These separate layers may be easily seen in the young subject, but in the adult they are more or less blended. The great omentum always contains some adipose tissue, which, in persons inclined to corpulency, often accumulates to an enormous extent. Its use appears to be (1) to protect the intestines from cold by covering them anteriorly as with an apron, and (2) to facilitate their movement upon each other during their vermicular action.

Like all the serous membranes, the peritoneum readily takes on inflammation from various exciting causes. This inflammation is termed *Peritonitis* (q. v.).

PERITONITIS, or INFLAMMATION OF THE PERITONEUM, may be either an acute or a chronic disease.

Acute Peritonitis generally presents well-marked symptoms. It sometimes commences with a chill, but severe pain in the abdomen is usually the first symptom. The pain is at first sometimes confined to particular spots (usually in the lower part of the abdomen), but it soon extends over the whole abdominal region. It is increased, on pressure, to such an extent that the patient cannot even bear the weight of the bedclothes; and to avoid, as far as possible, internal pressure upon the peritoneum, he lies perfectly still, on his back, with the legs drawn up, and breathes by means of the ribs, in consequence of the pain occasioned by the descent of the diaphragm in inspiration. The breathing is naturally shallow in these cases, and less air being admitted at each movement of respiration, the number of those movements is increased. There are perhaps forty or even sixty respirations executed in a minute, instead of eighteen or twenty. The pulse is usually very frequent, often 120 or more in the minute, and small and tense, though occasionally strong and full at the commencement of the attack. After the disease has continued for a certain time, the belly becomes tense and swollen; the enlargement being caused at first by flatus, and afterwards also by the effusion of fluid, as may be ascertained by percussion and auscultation.

The progress of the disease is in general rapid. In fatal cases, death usually takes place within a week, and often sooner. The symptoms indicating that the disease is advancing towards a fatal termination are great distention of the abdomen, a very frequent and feeble pulse, a pinched and extremely anxious appearance of the face, and cold sweats.

Peritonitis may arise from any of the ordinary causes of inflammation, such as sudden change of temperature (especially the combined effects of cold and wet on the surface of the body), excessive use of stimulating fluids, the suppression of long-standing discharges, translation of gout and rheumatism, &c. It is frequently the result of local violence, and of wounds penetrating the peritoneal sac, including various surgical operations. Besides the above causes, there are two which give rise to special varieties of peritonitis, viz., contagion or infection, which often prevails epidemically, and produces great mortality amongst women after childbirth, giving rise to puerperal peritonitis, one of the most perilous accompaniments of the awful disorder known as Puerperal Fever (q. v.); and perforation of the stomach, bowels, gall bladder, urinary bladder, &c., by which their contents are allowed to escape into the peritoneal cavity, where they excite the most violent inflammation. *Peritonitis* from *perforation* is characterised by the suddenness of the attack; intense pain, incapable of mitigation by medicine, all at once arising in some part of the abdomen, the whole of which soon becomes tender in every part. This form of the disease is generally fatal, death usually ensuing within two days, and sometimes within a few hours. Perforation of the small intestine, in consequence of ulceration of its glands, is of not uncommon occurrence in continued (typhoid) fever, and sometimes occurs in phthisis. That apparently useless structure, the vermiform appendage of the cæcum, is a comparatively frequent seat of perforation. Sometimes it is the stomach which is perforated, and in these cases the patients are usually unmarried women (especially domestic servants), who had previously appeared in good health, or at most had complained of slight dyspepsia.

The only disease with which peritonitis is likely

to be confounded by the well-educated practitioner is a peculiar form of hysteria; but the age and sex of the patient, the presence of hysteria in other forms, and the general history of the patient and of her symptoms, will almost always lead to a correct diagnosis of the disease.

The treatment, in an ordinary case of peritonitis (not arising from mechanical injury, or perforation from disease, or occurring in connection with puerperal fever), consists, if the patient is moderately robust, in bleeding from the arm, till a decided impression has been made on the circulation; after which the abdomen should be covered with twenty or thirty leeches, and the bleeding from their bites should be encouraged by fomenting the belly with flannels wrung out of hot water, or, if the patient can bear its weight, by the application of a light poultice. The system must, at the same time, be got as speedily as possible under the influence of mercury, by the means described in the treatment of Pericarditis (q. v.). Opium may be given freely, not merely to guard against the purgative action of the calomel, but with the view of securing sleep to the patient, and quiet to the inflamed membrane. The patient must be kept on low diet, unless indications of sinking appear. In peritonitis from perforation, the only remedy is opium, which must be given in large and repeated doses, so as to keep the bowels perfectly at rest, in order to promote the formation of adhesion, by which alone the patient can be possibly saved. For the same reason, perfect rest must also be insisted on, and even drinks forbidden, thirst being allayed by the application of ice to the tongue.

Chronic Peritonitis occurs in two forms, which differ in their origin and degree of fatality, but are very similar in their symptoms. In the first, the inflammation is of the ordinary character, and although the disease sometimes originates spontaneously, it is more frequently the sequel of an imperfectly cured acute attack; in the second, it depends upon granules (supposed by Louis and most writers to be tubercles) lying in countless numbers in the serous membrane, and serving as a constant source of irritation. The second form is confined almost, if not entirely, to persons of a scrofulous constitution.

The symptoms of chronic peritonitis are more obscure than those of the acute form. There is abdominal pain, often slight, and not always constant, which is increased by pressure, or sometimes is felt only when pressure is made. The patient complains of a sensation of fulness and tension of the belly, although its size is not visibly increased; of a loss of appetite; and of nausea and vomiting; and the bowels are usually more or less out of order. After a time, the abdomen enlarges, and becomes tympanitic, or more or less filled with fluid; and death gradually ensues from debility and emaciation, unless the fatal issue is accelerated by an acute inflammatory attack.

It is not always easy to determine, during life, whether the disease belongs to the first or second form. When its origin cannot be traced to a preceding acute attack, to local abdominal injury, or to chronic affections of the abdominal viscera, there is strong reason to believe it to be of the granular, or, as it is commonly called, the tubercular form, especially if the general constitution and the hereditary tendencies of the patient point in the same direction.

Little can be done in the way of treatment, especially in the tubercular form, further than mitigating the most distressing symptoms, and possibly retarding the final issue. The frequent application of a few leeches to the abdomen, followed

by warm poultices, occasional blisters, attention to the bowels, which, if costive, should be acted upon by gentle laxatives, and a mild, nourishing, but unstimulating diet, are more likely to be of service than remedies of a more energetic nature.

PERIWINKLE (*Littorina*), a genus of gasteropodous molluscs of the order *Pectinibranchiata* and family *Littorinidae*, having a proboscis-shaped head, a foot of moderate size, a single gill, and a rudimentary siphonal canal; the shell turbinated, thick, with few whorls, and no nacreous lining; the operculum of few whorls. A very well-known species is the COMMON P. (*L. littorea*), a snail-like mollusc most abundant on rocky parts of the British coasts, living in the lowest zone of sea-weeds between tide-marks, and feeding on fuci, &c. It is oviparous. No mollusc is more generally collected and used for food. Children are generally employed in collecting it. It is boiled in the shell, and so sold, often on the streets, and chiefly to the poorer classes, although few molluscs are more pleasant. It is calculated that 1900 tons, value £15,000, are annually consumed in London alone. It is called *Wilk*, *Wulk*, or *Whulk* in Scotland, but is quite different from the *Whelk* (q. v.) of the English, notwithstanding the sameness of name. Other species, *L. neritoides* and *L. rudis*, are common on all rocky parts of the British coasts, but are less esteemed. *L. rudis* is viviparous, and the shells of the young within the mantle of the parent often make it gritty and unpleasant to eat.

PERIWINKLE (*Vinca*), a genus of plants of the natural order *Apocynaceae*, having a 5-cleft calyx, and a salver-shaped corolla bearded at the throat, with five obliquely truncated segments. The leaves are opposite and evergreen; the flowers grow singly or in pairs from the axils of the leaves. The LESSER P. (*V. minor*), a native of many parts of Europe, and of the southern parts of Britain, growing in woods and thickets, is a half-shrubby plant with trailing stems, rooting at their extremities, ovato-lanceolate leaves, and pale-blue—sometimes white or reddish-purple—salver-shaped flowers. The GREATER P. (*V. major*), which has much larger flowers and ovato-cordate ciliated leaves, is a native of the south of Europe, and is found in a few places in the south of England. Both of these species are very commonly planted in shrubberies and gardens, rapidly cover unsightly objects with pleasing green foliage, and produce their beautiful flowers at almost all seasons of the year, even in winter when the weather is mild. The HERBACEOUS P. (*V. herbacea*), a Hungarian species, is remarkable for the abundance of its flowers. The YELLOW P. (*V. lutea*) is a native of the southern parts of North America. The ROSE-COLOURED P. (*V. rosea*), a native of Madagascar, is a favourite greenhouse plant.—The name P. was formerly *Perwinké*. Chaucer speaks of the 'fresh perwinké rich of hue.' It is probably from the French *pervence*, and that from the Latin *vinca*.

PERJURY is the crime committed by one who, when giving evidence on oath as a witness in a court of justice, or before some constituted authority of the same kind, gives evidence which he knows to be false. But in order to make the giving of the false evidence liable to criminal punishment, it must have been not only false to the knowledge of the witness, but the matter must have been material to the issue raised. If the falsehood occurred as to some trifling or immaterial fact, no crime is committed. Moreover, it is necessary, in proving the crime, that at least two persons should be able to testify to the falsehood of the matter, so that there might be a majority of oaths on the matter—there being then two oaths to one. But this rule is satisfied, though

both witnesses do not testify to one point. The perjury must also have taken place before some court or tribunal which had power to administer the oath. See OATH. Though in some courts affirmations are allowed instead of oaths, yet the punishment for false affirmation is made precisely the same as for false swearing. The punishment for perjury was, before the Conquest, sometimes death or cutting out the tongue; but latterly, it was confined to fine and imprisonment, and at present the latter is the only punishment, with the addition of hard labour. The crime of Subornation of Perjury—i. e., the persuading or procuring a person to give false evidence, is also punishable as a distinct offence.

PERKIN WARBECK. See HENRY VII.

PERM, the most eastern government of European Russia, is bounded on the E. by Siberia, and on the N., W., and S. by the governments of Vologda, Viatka, and Orenburg respectively. Area, 128,623 square miles—more than twice the area of England and Wales. Population, 2,173,501. It is divided by the Ural Mountains into two unequal parts, of which the smaller portion is on the eastern or Siberian side of the mountains, although, for administrative purposes, it is reckoned as a part of European Russia. About three-fourths of the government are occupied by the Ural range, which in some places reaches the height of 4000 feet; but which slope so gradually toward the plain, that the traveller reaches their summit before he is aware that he has made any unusual ascent. About two-thirds of the entire surface, comprising all the northern districts, are covered with forests, one-tenth of the area is in meadows, and about the same extent is under cultivation. The more important rivers belong to the systems of the Volga and the Obi. The Kama, together with the Tshousovaia and other affluents from the Ural Mountains, flow south-west, join the Volga, and thus form an important means of communication between the mining districts of P. and Europe. The Tura, the Sosva, and the Losva communicate with the Obi; and access is opened up to the White Sea and the Arctic Ocean by the rivers Dwina and Petchora. The climate is healthy, though somewhat rigorous. At the end of July, the nights are cold; in the middle of September, falls the first snow. In November, when the whole face of nature is covered with snow, the transport of goods by sledges is busily carried on everywhere. In January, the cold is so great that quicksilver sometimes freezes. At the end of March, the snow begins to melt, and before the middle of May, although the cold is still great, the country is clothed in the green of early spring. The chief products are gold, copper, magnetic iron ore, rock-crystal, jasper, agate, topaz, porphyry, malachite, porcelain clay, salt (obtained from salt springs), coal, alabaster, marble, &c., and diamonds in small quantities. The inhabitants are chiefly Russians, but there are also numbers of Tartars, Bashkirs, and Finns. The agricultural produce of the government, consisting chiefly of corn, vegetables, flax, and hemp, is more than sufficient for local consumption, and is exported to some extent to the neighbouring governments. The immense forests of the country yield wood for fuel, and timber for the construction of the barges which, during summer, are floated down the rivers, freighted with the products of the mines. In 1861, the number of works and manufactories in the government amounted to 1383, and employed 100,000 hands. Their produce amounted to £6,000,000 in value, of which the value of the iron was £2,000,000, and that of copper and gold was £200,000 each. Here, also, is a platina mine, said on good authority

to be the richest in the world. The iron of P. is famous over Europe. The commerce of the government is important. The fair of Irbit (q. v.) is, after that of Nijni-Novgorod, the most important in the Russian empire. The transit trade, however, is much more considerable than the local trade. The great highway from Siberia to European Russia passes through P., and the government communicates by means of the Volga, Petchora, and the Obi, with the Baltic, White, and Caspian Seas. The central administration of mines has its seat in Ekaterinburg.

The government of P. once formed a portion of the ancient Biarmia, inhabited in the earliest historical times by Finnish tribes, and even then famous for the commerce which it carried on, especially with Asia. In the 11th c., it became connected commercially with the principality of Novgorod, which, little by little, conquered and took possession of the country. At the close of the 15th c., both it and Novgorod were annexed to the territories of the Prince of Moscow, and about the same time the Christian religion was introduced.

PERM, a town of European Russia, capital of the government of the same name, on the Kama, 1357 miles east-south-east of St Petersburg. It was founded in 1729, under the name of the Egotinsky copper-work, and was the first colony in the government from which it derives its name. It is not in itself important for its commerce, but it is the seat of a most extensive transit trade. Here goods floated down the Tshousovaia from the Ural Mountains, are transferred to larger vessels, and forwarded by the Kama and Volga past Nijni-Novgorod and Rybinsk, and thence to St Petersburg. Goods from the sources of the Kama, metals, corn, tallow, and leathers, as well as articles of the Siberian and China trade, are also sent from P. to the Russian interior, and to Europe generally. A large steel foundry has been built here by the government. Pop. 28,859.

PERMIAN, MAGNESIAN LIMESTONE, or DIAS group, is the lower division of the New Red Sandstone rocks, which were separated, chiefly on palæontological grounds from the upper portion, and being, in 1841, without a collective name, were called Permian by Murchison, because he found them largely developed in that portion of Russia which composed the ancient kingdom of Permia, or Biarmia. The name Magnesian limestone is given to them because of the predominant deposit; and Dias has been proposed by some German geologists, to correspond with Trias, the name universally accepted for the upper section of the New Red Sandstone series.

The Permian strata occupy in Russia an area twice the size of France, and contain an abundant and varied suite of fossils. They are also largely developed in Germany, and as they have been there carefully studied, and described by numerous geologists, the rocks of that country may be considered as the types of the group. They have been thus grouped. 1. Bunterschiefer. 2. Zechstein. 3. Kupferschiefer or Mergel. 4. Rothe-todtlegende.

The Bunterschiefer consists of red and mottled marl and sandstone, which have been separated from the Triassic Bunter Sandstone, because of the occurrence in them of fossils which have a palæozoic facies. The Zechstein is chiefly a compact limestone with beds of coloured clays, and cellular magnesian limestone. The well-known Stinkstein belongs to this series; it is a dark-coloured and highly bituminous limestone, which gives out an offensive odour when struck or rubbed. The name Zechstein (literally, minestone) was given to these

beds, because they must be mined or cut through to reach the Kupferschiefer below. This latter is a marl slate, richly impregnated with copper pyrites, for which it was extensively wrought. It contains numerous beautifully preserved fossil fish belonging to the genera *Palæniscus*, *Cœlacanthus*, *Platysorus*, &c. The strange name of *Rothe-todtliegende* (red dead-layers) was given to a large deposit of red sandstone and conglomerate, by the miners, because the copper obtained from the beds above died out when they reached these red rocks.

The succession of rocks given by Murchison as occurring in Permian, are easily co-related with those of Germany. They are (1), conglomerates and sandstones, containing the remains of plants; (2), red sandstones and shales, with copper ore and vegetable remains; and (3), sandstones, grits, and fossiliferous limestones, with interstratified beds of marl and gypsum, the marls occasionally containing plants, and also seams of impure coal.

In England, the Permian rocks are somewhat extensively developed in Durham, where they have been described by Sedgwick and King. From this county, they continue in a narrow strip bordering the Carboniferous beds down the centre of England, until they are lost near Nottingham. In Cheshire, Shropshire, Stafford, and Warwick, they underlie the salt-bearing triassic rocks. The Durham strata are grouped as follow :

- | | |
|------------------------------------------------------|-------------------------|
| 1. Concretionary and amorphous limestone, . . . | } = Bunterschiefer. |
| 2. Brecciated and pseudo-brecciated limestone, . . . | |
| 3. Fossiliferous limestone, . . . | } = Zechstein. |
| 4. Compact limestone, . . . | |
| 5. Marl slate, . . . | } = Kupferschiefer. |
| 6. Inferior various-coloured sandstone, . . . | |
| | } = Rothe-todtliegende. |

The fractured bones and teeth of saurians found in the basement bed of the sixth group are the earliest evidence of the existence of reptiles. They belong to the *Rhynchocephalia*, an order which has one living representative in New Zealand.

The known organic remains of this period are neither remarkable nor abundant. Many palæozoic forms became extinct within this period; among them are the remarkable *Sigillaria* and the *Neuropteris* of the coal-beds, the well-known brachiopod, *Producta*, and several genera of heterocerat-tailed fish. Some new forms appear, the most important of which are the labyrinthodont reptiles, which, though beginning in the upper Carboniferous beds, increase in number in the Permian, and reach their maximum development in the succeeding Triassic group.

PERMUTATIONS AND COMBINATIONS.

A combination, in Mathematics, is a selection of a number of objects from a given set of objects, without any regard to the order in which they are placed. The objects are called elements, and the combinations are divided into classes, according to the number of elements in each. Let the given elements be the four letters *a, b, c, d*; the binary combinations, or selections of two, are *ab, ac, ad, bc, bd, cd*—six in all; the combinations of three are *abc, abd, acd, bcd*—four in all; while there is only one combination of four, namely, *abcd*.

Permutation, again, has reference to the order of arrangement; thus, the two elements, *a* and *b*, may stand *ab* or *ba*, so that every combination of two gives two permutations; the three elements, *a, b, c*, may stand *abc, acb, bac, bca, cab, cba*, one combination of three thus affording six permutations. The combinations of any order with all their permutations are called the *Variations*. Formulas are given in works of algebra for calculating the

number of permutations or combinations in any given case. Suppose seven lottery-tickets marked 1, 2, 3, to 7, and that two are to be drawn; if it is asked, how many possible pairs of numbers there are, this is a question of the number of combinations of seven elements, two together, which is found to be 21. *If we want to know how many times the same seven persons could sit down to table together with a different arrangement each time, this is to ask how many permutations seven objects admit of, and the formula gives, $7 \times 6 \times 5 \times 4 \times 3 \times 2 = 5040$. The theory of probabilities is founded on the laws of combination. Thus, in the case of drawing two tickets out of seven, since there are 21 possible pairs, the chance or probability of drawing any particular pair is 1 in 21, or $\frac{1}{21}$. In working out questions in 'combinations,' advantage is often taken of the fact that whatever number of elements be taken from a group to form a combination, the number left gives the same number of combinations; thus the number of combinations of 10 elements three together, is the same as that of 10 elements seven together, &c.

PERN. See HONEY BUZZARD.

PERNAMBUCO, the most eastern seaport of Brazil, stands at the mouths of the Biberibe and Capeberibe, in lat. 8° 4' S., long. 34° 52' W., 80 miles south of Parahiba. It is the greatest sugar-mart in Brazil, and is the third in commercial importance of the cities of the empire. It consists of three portions, connected by roads and bridges—*Recife*, the chief seat of commerce, on a peninsula; *S. Antonio*, the middle district, on an island between the peninsula and the mainland; and *Boa Vista*, on the mainland. The inner harbour, which has a depth of from 10 to 30 feet, is formed by a reef which extends along the coast at a distance of from a quarter to half a mile from the coast. This reef serves the purposes of a breakwater. Opposite the northern extremity of the city, there is an opening in the reef, resembling an artificial cut, and forming a passage of sufficient width to admit of the entrance of vessels drawing 16 feet of water. No port is more easily accessible than the outer harbour of Pernambuco. There is a light-house in the harbour, and it is defended by several forts. Formerly, the city was extremely dirty, the streets unpaved, and much inconvenience was suffered from want of a proper supply of water. Of late years, however, many improvements have been introduced; water-works have been erected, extensive and spacious quays formed along the margins of the rivers, and the streets have, in most instances, been paved and lighted. Numerous *collegios* and other educational institutions have been established, and the growing wealth and commercial prosperity of the city have been accompanied by an increasing degree of comfort and refinement. The principal exports are sugar, cotton, rum, hides, and dye-woods. In 1870—1871, 1,164,655 tons of sugar were exported. The imports are woollen and cotton cloths, hardware, silks, wines, and flour. Pop. about 120,000.

PERNAMBUCO, a maritime province of Brazil, is bounded on the south-east by Bahia and Alagoas, and on the north-west by Piauí, Ceará, and Parahiba. It contains 61,068 square miles, and has a population of 1,220,000. The coast is flat and fringed with coral reefs, which render navigation dangerous. The chief river is the San Francisco, which forms the southern boundary, and includes the greater portion of the area of the province in its basin. The banks of this river comprise many rich, expansive meadows, and here the cattle are reared, which, in the form of beef and hides, form an important article of export at the

seaport of Pernambuco. Much of the cotton and sugar brought to the market of the capital is harvested about 300 miles inland, in regions fertilised by streams that rise at the base of the Santa Barbaretta Hills, the first hill-range in this district that arrests the trade-wind from the Atlantic, laden with rain. The Recife and San Francisco railway, an English enterprise, is a single line $77\frac{1}{2}$ miles long, to be extended 400 miles through a district covered with valuable sugar-plantations. The province comprises immense tracts of rich and fertile soil, productive in sugar-cane, cotton, maize, fruits, vegetables, and medicinal herbs. From the forests, balsams, gums, and dye-woods are obtained.

PERNAMBUCO WOOD. See **BRAZIL WOOD.**

PERNO'W (Germ. *Pernau*), a seaport of the Baltic Provinces, Russia, in the government of Livonia, stands on a sandy heath at the mouth of a river of the same name, on the Gulf of Riga, 102 miles north of the port of Riga, and 350 miles west-south-west of St Petersburg by sea. The mouth of the river is so shallow that large vessels are obliged to anchor in the roads. The exports are chiefly flax, linseed, corn, and timber; the principal imports are salt and herrings. In 1866, 124 vessels, of which 44 were English and 24 Prussian, entered the port. Pop. 9527.

PERPENDICULAR. A straight line standing on another straight line is said to be perpendicular to that other when the angles it makes on both sides are equal (see **ANGLE**). A line is said to be perpendicular to a plane when it is at right angles to any line in that plane meeting it. Planes are said to be perpendicular to each other when any line in the one plane perpendicular to their common line of intersection is also perpendicular to all lines meeting it in the other plane.

The word 'perpendicular,' in common usage, refers to a direction at right angles to the surface of still water, and is synonymous with vertical.

PERPENDICULAR, the name given to the style of Gothic architecture in England which succeeded the Decorated Style. It prevailed from about the end of the 14th c. to the middle of the 16th c., and was thus contemporary with the Flamboyant Style in France. These styles have much in common, but they derive their names from the features peculiar to each. Thus, the Flamboyant (q. v.) is distinguished by the flowing lines of its tracery; whilst the Perpendicular is remarkable for its stiff and rectilinear lines. The lines of the window-tracery are chiefly vertical, and the mullions are frequently crossed by horizontal bars. The mouldings are usually thin and hard. The same feeling pervades the other features of the style; the buttresses, piers, towers, &c., are all drawn up and attenuated, and present in their shallow recesses and meagre lines a great contrast to the deep shadows and bold mouldings of the earlier styles. The art of masonry was well understood during the Perpendicular period, and the vaulting was admirably built. Fan-tracery Vaulting (q. v.) belongs to this style. The depressed or four-centre arch is another of its peculiar features. This arch, over doorways, has the mouldings generally arranged in a square form over the arch, with spandrels containing shields, quatrefoils, &c. Panelling was also much used, the walls being frequently almost entirely covered with it, as in Henry VII.'s Chapel at Westminster. There are many well-known buildings of this style. Most of the colleges at Oxford and Cambridge belong to it, and in almost every cathedral and church of importance, there are some specimens of it. Open timber-roofs are

very common in the Perpendicular Style, and are amongst the peculiar and beautiful features of the

Nave of Winchester Cathedral.

architecture of England. The roof of Westminster Hall, built by Richard II., is the largest example ever erected.

PERPENDICULAR FORTIFICATION owes its origin to the Marquis de Montalembert, a distinguished French general, who published his work upon the subject in 1776. Vauban had, it was admitted, rendered the art of attack superior to that of defence. Montalembert strove to reverse this relation, and, in his endeavours, rejected entirely the bastion system of the older engineers. Instead of the occasional bastions, with intervening curtains (see **FORTIFICATION**), with which they surrounded their *enceinte*, he broke the whole polygon into salient and re-entering angles, the latter being generally right angles. Before the connected redans thus formed were counterguards of low elevation and ravelins, to which the approaches were through casemated *caponnières*. In the salient angle of each redan, he built a brick tower, 40 feet in diameter, twelve-sided, and four stories high. The second and third tiers were built for heavy guns, and the upper loopholed for musketry. In the centre of the tower was a circular *réduit*, intended as a last refuge for the garrison. Montalembert maintained that from

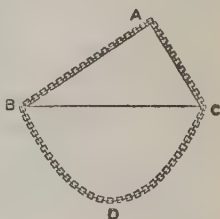

these towers every possible approach could be commanded, which to a great extent is true; but it must be also remembered that the greater space a gun commands, by so much the more is it raised above the plain, and rendered visible. These towers would have little chance against the rifled ordnance of the present day. Montalembert's system was violently attacked by the French engineers, but Carnot subsequently adopted it, with some modifications, and it enters largely into the modern German defensive works. The system has never, however, found favour with British engineers.

PERPETUAL CURE, a form of ecclesiastical beneficence which grew out of the abuse of lay Impropriation (q. v.), the impropriator appointing a clergyman to discharge the spiritual functions of which he himself was not capable. The substituted clergyman, in ordinary cases, is appointed by the bishop, and called a vicar; but when no provision is made for a vicar, the impropriator appoints the clergyman, who is called a perpetual curate. The perpetual curate enters on his office without induction or institution, and requires only the bishop's licence. Perpetual cures are also created by the erection and endowment of a chapel subject to the principal church of a parish. Such cures, however, are not benefices, unless endowed out of the fund called Queen Anne's Bounty. Churches so endowed are, by 2 and 3 Vict. c. 49, recognised as benefices. The district churches which have been erected under several recent acts are made perpetual cures, and their incumbents are corporations.

PERPETUAL MOTION, THE. According to Newton's First Law (see MOTION, LAWS OF), all unresisted motion continues for ever unchanged. Thus, if friction could be avoided, a top or a gyroscope spinning in vacuo is an instance of motion which would be unchanged for ever, and which, therefore, might be called perpetual. The motion of the sun in space, the earth's rotation about its axis, and numerous other common motions, are in this popular sense perpetual. [It is necessary to remark here, that even these motions are subject to retardation; for instance, those of the bodies of the solar system, by the resistance of the luminiferous medium, which we know to be matter, and which fills all space. This was remarked by Newton himself, for he says, 'the larger bodies, planets and comets, preserve their motions longer (than terrestrial objects), because they move in less resisting media.' The same cause influences the motion of the gyroscope, but in its case there is another retarding influence at work, due to the production of electric currents by the magnetism of the earth.] But this is not what is technically understood by the title *The Perpetual Motion*. It means an engine which, without any supply of power from without, can not only maintain its own motion for ever, or as long as its materials last, but can also be applied to drive machinery, and therefore to do external work. In other words, it means a device for creating power or energy without corresponding expenditure. This is now known to be absolutely impossible, no matter what physical forces be employed. In fact, the modern physical axiom, the Conservation of Energy, (see FORCE), founded on experimental bases as certain as those which convince us of the truth of the Laws of Motion, may be expressed, in the negative, thus: *The perpetual motion is impossible*. Helmholtz's beautiful investigations regarding Conservation of Energy (referred to in FORCE), are founded on this axiom. So is the recent application, by Clausius, of Carnot's remarkable investigation of the 'Motive-power of Fire' to the true Theory of Heat. Other instances will be mentioned at the end of the article.

The complete statement of the impossibility of procuring the perpetual motion with the ordinary mechanical arrangements, in which it was most commonly sought, is to be found in the *Principia* (q. v.), as a deduction from Newton's Third Law of Motion. The equivalent principle of Conservation of Energy is there stated in a manner which leaves nothing to be desired; although not given in anything like the modern phraseology. Yet it is usually said, in works on the Perpetual Motion, that De La Hire (in 1678) gave the first proof of its impossibility in ordinary mechanics. This proof, published long after Newton's, is by no means so complete, as it exposes only some of the more patent absurdities which had been propounded for the solution of the problem. It is certain, and worthy of particular notice, that Newton was far in advance of the greatest of his contemporaries and their immediate successors, in even the fundamental notions of mechanics. Thus, we find John Bernoulli seriously propounding a form of the perpetual motion, depending upon the alternate mixture, and separation by a filter, of two liquids of different densities; an arrangement which is as preposterous as the very common suggestion of a water-wheel which should pump up its own supply of water; and whose absurdity must be evident to any one acquainted with Newton's chapter on the Laws of Motion.

It is curious that, long before Newton's time, the physical axiom, that the perpetual motion is impossible, was assumed by Stevinus as a foundation for the science of Statics. This is particularly interesting when we compare it with the magnificent discoveries which have been evolved in our own day from the same principle applied to the physical forces generally, and not to gravitation alone, as contemplated by Stevinus. His process is as follows: Let an endless chain of uniform weight be passed round a smooth triangular prism ABC, of which the face BC is horizontal. The free portion of the chain BDC will hang in a symmetrical curve (CATENARY, q. v.), and its tension will therefore be the same at B and at C. Hence the other portion BAC of the chain will be free to move, unless the resolved part of the weight of AB, acting down the inclined plane AB, just balance that of the corresponding portion of the chain down AC. If these balance, the parallelogram of forces is proved; if not, one side will preponderate, and we shall evidently obtain the perpetual motion.

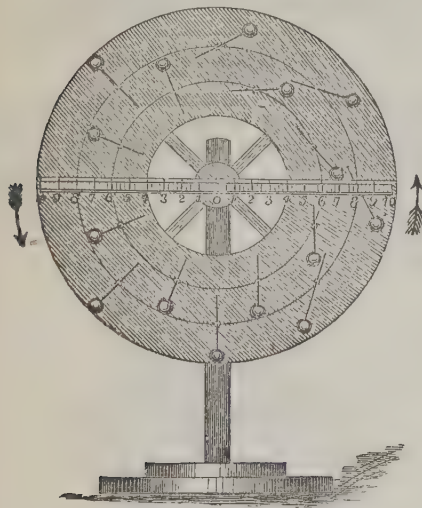

We will briefly sketch the history of the simpler part of the problem, where mechanical and hydrostatical arrangements alone are contemplated, and where the impossibility of procuring the perpetual motion had been completely shewn by Newton.

The leading features of the various devices suggested as self-moving engines are three: 1. The machine being a combination of mechanical powers driven by weights, was to be constructed so as constantly to wind up those weights as they fell, and therefore to be constantly in the same circumstances as to power in each successive complete revolution. The ideal of this, in its simplest form, is that of a wheel moving about a horizontal axis, and so adjusting certain heavy sliding pieces on its surface, as to have always a preponderance on one particular side. 2. The type of the second class differs from that of the first only in the substitution of liquids for the weights in the first class, and the consequent introduction (often in most extravagant forms) of

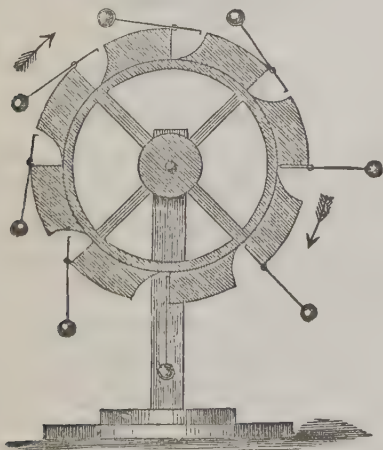

hydrostatical laws, which the inventors seem to have considered less certain and more pliable than the stern facts of common mechanics. 3. The machine depends on some natural power, such as rain, change of temperature, wind, fluctuations of the barometer, tides, &c. The consideration of this third class is very interesting, but we will defer it for a little.

Of the first class, the only machines that seem ever to have succeeded in permanently deceiving any but their inventors are those of the Marquis of Worcester and of Councillor Orffyreus. Contemporary with the former was Bishop Wilkins, who candidly and ingeniously points out the fallacies of various devices of his own, depending severally on weights, on magnets, and on Archimedes's screw. His first attempt seems to have been closely allied to that of the Marquis of Worcester, of whose engine we have no drawing, and only a very vague description. The following figures give us, however, some

Bishop Wilkins's First Form.

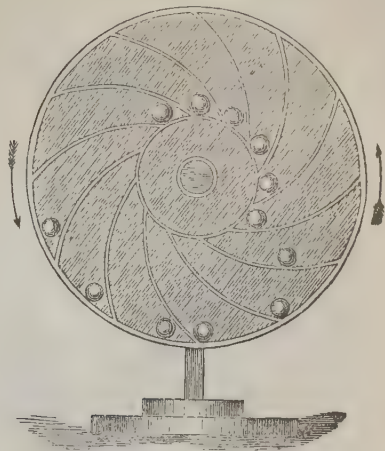

notion of its probable nature. The first is one of Wilkins's, the second that of Jackson, the third that

Jackson's Perpetual Motion.

of Merlin. Their construction is evident from the figures.

In all three, the attempt is by the sliding of the balls in their cells, or by the turning of the levers, to give the preponderance to the descending side of

Merlin's Perpetual Motion.

the wheel. But even the cuts shew that though the weights on the descending side are on the whole further from the axis of the wheel than those on the ascending side, yet there are more balls on the latter than on the former side; and a careful examination, like that made by Wilkins, shews that their moments in opposite directions about the axis balance each other. With reference to the invention of the Marquis of Worcester—who is otherwise well known as one of the first to foresee, and even in part to realise experimentally, the advantage of steam as a motive-power—we find the following in his *Century of Inventions*: ‘*An Advantageous Change of Centers.*—To provide and make that all y^e weights of y^e descending syde of a wheele shal be perpetually further from y^e center, then those of y^e mounting syde, and yett equal in number and heft of y^e one syde as y^e other. A most incredible thing if not seene, butt tryed before y^e late King of happy and glorious memorye in y^e Tower by my directions, two Extraordinary Embassadors accompanying his Ma^{tie} and y^e D. of Richmond, D. Hamilton, and most part of y^e Court attending him. The wheele was 14 foote ouer, and 40 weights of 50 p^d apiece; S^r Wm. Belford, then Lieu^t of y^e Tower, and yett living can justify it with seuerall others; They all saw that noe sooner these great weights passed y^e Diameter Line of y^e vpper syde but they hung a foote further from y^e center, nor no sooner passed the Diameter Line of the lower syde, butt they hung a foote nearer; bee pleased to judge y^e consequence.’

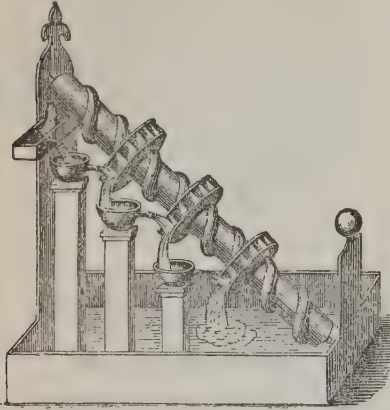

The machine of Orffyreus, by which 'S Gravesande was completely taken in, so much so that he wrote to Newton expressing his belief that the perpetual motion was really found, consisted of a large wheel or drum covered with canvas, to prevent the interior from being seen, and rotating about a thick horizontal axle. This machine, when set agoing in either direction, moved with accelerated speed till it reached a rate of twenty-five turns in a minute; and on one occasion was sealed up by the Elector of Cassel for two months, and at the expiration of that time found to be moving as rapidly as ever. This, like the celebrated automaton chess-player, was evidently a case of clever imposition; and but for its strange effect

* See Harleian MS., No. 2428, in the British Museum.

PERPETUAL MOTION.

on S Gravesande, would probably have been forgotten long ago. Tricks of this kind, more or less ingenious, such as that of Spence of Linlithgow (1818), which many of our readers may recollect, are still common, especially in America.

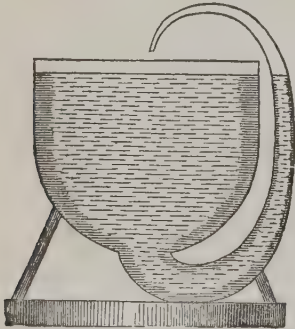

Bishop Wilkins's third form is a good example of the second class of contrivances above mentioned. Its construction will be readily understood

Bishop Wilkins's Third Form.

from the annexed cut. The water-wheels, driven by the descending water, are intended to turn the Archimedean screw, so as constantly to replenish the tank above. Wilkins's calm investigation of the reasons why his device will not succeed, is very interesting and creditable.

As a contrast, let us take a case of special absurdity, that of Norwood. In the figure, it is supposed that, as the weight of the water or

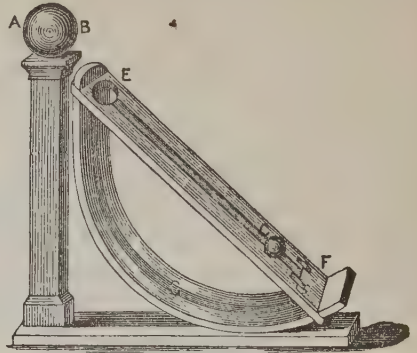

Norwood's Perpetual Motion.

mercury in the large vessel immensely exceeds that in the neck, it will preponderate, and drive the liquid through the spout into the vessel again; thereby furnishing, not only an admirable perpetual motion, but a conclusive disproof of one of the fundamental laws of Hydrostatics.

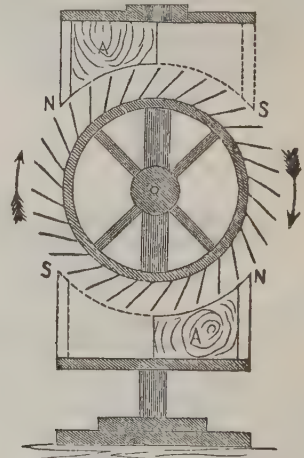

The second of Wilkins's cases is an instructive one. It depends on magnetism, and will be readily understood from the cut. AB is a loadstone, which draws the iron ball C up the inclined plane to E, where there is a hole through which the ball falls down the curved incline, pushes open a trap at F, and is dragged again up the plane by the loadstone. The error of this is the neglect of the action of the loadstone on the falling ball. There would be an admirable case of the perpetual motion if we could

remove or annihilate (without expenditure of work) the action of the loadstone during the descent. Unfortunately, the law of magnetic attraction is the

Bishop Wilkins's Second Form.

same as that of gravitation, and what is impossible with the one, must be equally so with the other. A good illustration of this is Addeley's Perpetual Motion, represented in the annexed sketch. The spokes projecting from the wheel are magnets, whose south poles are all turned from the centre. These are attracted by the north poles (N), and

Addeley's Perpetual Motion.

repelled by the south poles (S) of four fixed magnets; and blocks of wood (A) are interposed, to prevent magnetic action where it would tend to stop the machine! If it were possible to find a substance which would deal with gravitation or magnetism as an opaque body does with light (casting a shadow), the perpetual motion would be obtained with the greatest ease.

It would be tedious and unprofitable to go through the various physical forces, shewing how a misconception of their laws has led to hundreds of patented schemes for the production of perpetual motion. We may merely hint at magneto-electric machines turned by electro-magnetic engines, to which they supply the electric currents; electric machines, driven by a gas-engine, the fuel for which is supplied by the decomposition of water by the electricity produced, &c.; the absurdity of all of which may be imagined from the perfectly analogous case of a steam-engine to which heat might be supposed to

be supplied by the friction of bodies driven by the engine itself. An excellent example of this absurdity is furnished by the writings of one of our ablest geologists. He considers that the internal heat of the earth may be due to chemical combination, that the heat so produced may develop thermo-electric currents, and that these in their turn may decompose the compounds formed, so that the process may go on indefinitely.

But the third class of attempts above described merits a few words. It certainly does *not* give the perpetual motion, but it is capable of furnishing prime-movers which will work uninterruptedly for perhaps hundreds of thousands of years. This is done, however, as we should expect, at the expense of other stores of energy in the universe. Thus, the tide-wheel, or tidal engine, a little-used but most effective source of power, derives its energy entirely from the earth's diurnal rotation. Engines driven by collected rain-water, such as mill-wheels, &c., and others driven by power stored up from winds, &c., depend upon energy radiated from the sun, mainly in the form of heat. None of these can, therefore, in strictness be called the perpetual motion, since the energy of the earth's rotation, or of the sun's heat, is drawn upon in their production.

But the complete proof of the impossibility of procuring the perpetual motion by any arrangement whatever, involving any known forces, was arrived at mainly by the experiments of Joule (q. v.), who shewed that the principle of the Conservation of Energy extends, not alone to the forces for which it was enunciated by Newton, but to every known form of physical action. The date 1840—1845 may thus be said to have finally settled this long-disputed question; at all events, until new forms of physical forces may happen to be discovered; and we are now in a position to do generally, what was wisely done by the French Academy in 1775 for ordinary mechanical contrivances alone—viz., refuse to consider any scheme whatever which pretends to give work without corresponding and equivalent expenditure. The language in which this decision of the French Academy is recorded (*Histoire de l'Académie*, 1775) is well worthy of being quoted, for its calm scientific clearness and brevity, and for its present applicability to physical science in general: 'The construction of a perpetual motion is impossible. Even if the effect of the motive-power were not in the long run destroyed by friction and the resistance of the medium [in which the motion takes place], this power could produce merely an effect equivalent to itself. In order, therefore, to produce a perpetual effect from a finite cause, that effect must be infinitely small in any finite time. Neglecting friction and resistance, a body to which motion has been given will retain it for ever; but only on condition of its not acting on other bodies, and the only perpetual motion possible, on this hypothesis (which, besides, cannot occur in nature), would be useless for the object which the devisers of perpetual motions have in view. This species of research has the inconvenience of being costly; it has ruined many a family; and numerous mechanics, who might have done great service, have wasted on it their means, their time, and their talents.

'These are the principal motives which have led the Academy to its decision. In resolving that it will no longer notice such speculations, it simply declares its opinion of the uselessness of the labours of those who are devoted to them.'

It has been asserted that the infatuation of the perpetual motionists, who (as may be seen by a glance at the specifications of patents in Britain, France, Belgium, America, &c.) are perhaps more numerous now than ever, is due to two causes—

one, the idea that the perpetual motion is a lost, but recoverable invention; the other, that some immense government reward has been for years laid aside for the successful discoverer. But, unhappily, these ideas are as fallacious as the grand delusion itself; and any one who, in the present state of science, allows himself to be carried away by this fascinating inquiry, loses his time and wastes his talents, more hopelessly than even a 'squarer of the circle.'

In conclusion, we may mention a few of the cases already hinted at, in which the impossibility of the perpetual motion formed the basis of an investigation. These will shew the great use which may be made of even a negative proposition. Helmholtz has shewn from it that the ultimate particles of matter must exert upon each other forces, whose direction is that of the line joining each pair of particles, and whose magnitude depends solely on their distance. J. Thomson employed it to shew that the freezing-point of water is lowered by pressure, as otherwise work might be created by the freezing of ice-cold water. W. Thomson has employed it to shew that a diamagnetic (see DIAMAGNETISM) body does *not* take the opposite magnetism to iron, when in similar circumstances; for if it did, and if, like iron, it took time for the full development of the action, a perpetual motion might be produced.

The literature of this subject is very extensive, but scattered mainly through Patent Records and ephemeral pamphlets. The *Journal des Savants*, and Montucla's *Histoire des Mathématiques* may be consulted; but especially we would refer the curious reader to a recent work by Mr Dircks (of Patent-Ghost notoriety) entitled *Perpetuum Mobile* (Spon, London, 1861); to which we have been indebted for some of our historical notices. The tenor of the work is such that we cannot easily discover whether the author is a perpetual-motionist or not; but, however this may be, it is extremely complete and interesting as a history.

PERPETUITIES, LAW AGAINST, consists in a rule adopted in England to the effect that property cannot be tied up for a period longer than the lives of some parties already in existence, and 21 years more. Those who have the power of disposing of their property have often attempted to regulate the succession of their estate at distant periods. Such was the object of the original practice of entailing property, and so enforcing the devolution of property on a certain series of heirs to the remotest generations. This power of testators was always looked upon with jealousy, as tending to embarrass future dealings with the property, and frustrate the purposes for which property is established. So early as the reign of Edward IV., a decision was come to by the courts in Taltarum's case, which had the effect of allowing the first tenant in tail in remainder, on arriving at majority to disentail the estate at discretion. Hence, in England, there has been ever since no mode of settling property in any way so as to tie it up beyond the life of the first who takes an estate of freehold, and the nonage of the tenant in tail next in remainder—i. e., the lives of persons in existence, and 21 years more. This principle applies not only to land, but to personal property. As to the accumulation of the income of property, an attempt was made by the late Mr Thellusson to create an immense fortune by directing the income of his property to be accumulated during the lives of all his children, grandchildren, and great-grandchildren, who were living at the time of his death, for the benefit of some future descendants, to be living at the death of the survivor. The probable amount of the accumulated fund was expected to be 19 millions. The will was in great measure

defeated by the existing law, but in consequence of so conspicuous an attempt, an act of parliament was passed, called the Thellusson Act (39 and 40 Geo. III. c. 98), which in future forbids the accumulation of income for any longer time than the life of the grantor or settler, or 21 years from his death. In Scotland, so far from the above doctrines having been early adopted, the contrary doctrine was established. See *ENTAIL*.

PERPIGNAN, a town of France, and a fortress of the first rank, capital of the department of Pyrénées-Orientales, on the right bank of the river Tet, 5 miles from the Mediterranean, and 40 miles by railway south of Narbonne. It commands the passage by the Eastern Pyrenees from Spain into France, and is defended on the south by a citadel and by ramparts flanked with bastions, and protected by raised works. The works underwent a thorough repair in 1823, and P. now ranks as one of the first strongholds in France. Its appearance is exceedingly picturesque. From a distance, its houses are seen in the midst of a forest of orchards; and a closer examination shews a collection of narrow streets, covered with awnings; houses of semi-Moresque construction, with wooden balconies and courts, and other evidences of Spanish influence. The cathedral, a massive building, begun in 1324; the belfry of St Jacques and the Castiller (now used as a military prison), with its battlements and machicolations, give character to the town. P. contains barracks for 5000 men, a council-house, palace of justice, mint, a college, numerous schools, museums, and scientific societies. Good *vin ordinaire* (red) is grown in the vicinity; woollen cloths, playing-cards, leather, &c., are manufactured, and there is a good trade in wine, brandy, wool, and silk. Pop. 23,462.

P., as capital of the former county of Roussillon, remained long in the hands of the kings of Aragon, and in 1349, King Pedro founded a university here. In 1642, it was taken by Louis XIII.; and since that time, the town itself, together with the county of Roussillon, has remained in the possession of the French.

PERRAULT, CHARLES, a French writer, born at Paris, 12th January 1628, was the son of an advocate, and received a good education. In 1651, he became a member of the Paris bar, and obtained a considerable measure of success as a pleader; but having made the acquaintance of the minister Colbert, he was ere long diverted from the practice of his profession by receiving the appointment of Controller-general of the Royal Buildings. In 1671, the influence of Colbert procured for him an entrance into the French Academy, into which learned body he introduced several important reforms. What first made his name well known was his famous controversy with Boileau regarding the comparative merits of the ancients and moderns, which originated in a poem of P.'s, entitled *Le Siècle de Louis le Grand*, read before his confrères of the Academy, and intended to prove that modern authors were superior to Homer, Herodotus, Plato, Aristotle, Virgil, &c. It was followed up by an elaborate and methodically written *Parallèle des Anciens et des Modernes* (4 vols. 1688—1698), which, though an able and learned performance, is a complete failure in its logic. Boileau was his keenest opponent, and fiercely, not to say rudely, assailed him in his *Réflexions sur Longin*, to which P. replied with equal acrimony, but not with equal wit, in his *Apologie des Femmes* (1694). One good effect of this quarrel was to turn P.'s attention still more closely and critically to his contemporaries, the result of which was an admirable work, *Hommes*

Illustres du Siècle de Louis XIV., containing 200 critical biographies. But the work that has far more than any other preserved his name is his *Contes des Fées*, or Fairy Tales. See *NOVELS*. The grace, liveliness, and ingenious child-like fancy displayed in these charming compositions, are beyond all praise, and when we remember that their author was far advanced in years when he wrote them, the feat seems miraculous. 'Second childhood' is not always so like the 'first,' as that of P. seems to have been. P. died 16th May 1703.

PERRY, an agreeable beverage made by fermenting the juice of pears. It is extensively made in Worcestershire, Gloucestershire, Herefordshire, and Devonshire, and forms, with cider, the chief drink of those districts. It contains from five to nine per cent. of alcohol. The best pears for making perry are those which from their rough taste are least agreeable for eating.

PERSEA. See *AVOCADO PEAR*.

PERSECUTIONS, *THE TEN*, of the Christian Church, is the name by which are known in ecclesiastical history certain periods of special severity exercised towards the rising community of Christians, for the purpose of compelling them to renounce their new creed, and to conform to the established religion of the empire. The Christian community were at all times regarded with suspicion and dislike in the Roman empire—the constitution of Rome not only being essentially intolerant of those new religions which, like the Christian, were directly aggressive against the established religion of the state, but being particularly hostile to private associations and private assemblages for worship, such as those which every Christian congregation by its very nature presented; and thus there are very few periods, during the first three centuries, in which it can be said that the church enjoyed everywhere a complete immunity from persecution. But the name is given particularly to certain periods when either new enactments were passed against Christianity, or the existing ones were enforced with unusual rigour. The notion of *ten* such periods is commonly accepted almost as an historical axiom; and it is not generally known that this precise determination of the number is comparatively recent. In the 4th c., no settled theory of the number of persecutions seems to have been adopted. Lactantius reckons up but six; Eusebius does not state what the number was, but his narrative supplies data for nine. Sulpicius Severus, in the 5th c., is the first who expressly states the number at *ten*; but he only enumerates nine in detail, and in completing the number to ten, he adds the general persecution which, at the coming of Antichrist, is to precede the end of the world. The fixing of ten as the number seems to have originated in a mystic allusion to the ten horns of the beast in the Apocalypse (xvii. 12).

It need hardly be said, however, that this is only a question of words, the diversity of enumeration arising from the different notions attached by the several historians to the designation *general*. If taken quite strictly to comprise the entire Roman empire, the number must fall below ten; if used more loosely of local persecutions, the number might be very largely increased. The ten persecutions commonly regarded as general are the following: the persecution under Nero, 64 A.D.; under Domitian, 95 A.D.; under Trajan, 107 A.D.; under Hadrian, 125 A.D.; under Marcus Aurelius, 165 A.D.; under Septimius Severus, 202 A.D.; under Maximinus, 235 A.D.; under Decius, 249 A.D.; under Valerianus, 257 A.D.; under Diocletian, 303 A.D. The extent and the duration of some of these have been the subject of

considerable controversy, and indeed an animated discussion was maintained for a long period as to the probable total number of victims in the pagan persecutions of the church. Such controversies are beyond the scope of this publication. It is quite certain that there have been exaggerations on the Christian as well as on the adverse side; but it has been shewn beyond the possibility of doubt, and the most recent explorations have confirmed the arguments, that the data on which the estimates of Dodwell and Gibbon, the most prominent advocates of the theory of the small number, were founded, were uncertain, and even fallacious; and that, not to speak of the many victims of the constantly recurring local violences, the number who fell in each of the above-named persecutions was both large in itself, and spread, in most cases, over a considerable extent of the Roman empire. The most violent, as well as the most widely-spread of these persecutions, were those under Nero, Trajan, Maximinus, Decius, and Diocletian. The last-named, though called by Diocletian's name, was in reality far less the work of that emperor than of his colleague Galerius; but it was extremely cruel, and, with occasional interruptions, continued from the year 303 down to the victory of Constantine over Maxentius—a period of nearly ten years.

PERSEPOLIS (Persian City), the Greek translation of the lost name of the capital of ancient Persia (*Parsa-Karta?*), was situated on the river Araxes (Bendemir), to the east of the river Medus (Polwat, or River of Murghab), in the plain of Merdusht, about 35 miles to the north-east of

Shiraz, on the road to Ispahan. A certain number of most remarkable ruins is all that now remains of that city, with which, according to ancient writers, 'no other city could be compared either in beauty or in wealth,' and which was generally designated 'The Glory of the East.' Darius Hystaspes, Xerxes, Artaxerxes, and other Achæmenides, each in his turn contributed towards its aggrandisement. Alexander the Great, in his march of conquest, is said to have destroyed P. completely; but this must probably only be understood to apply to some of the chief palaces. It may also be presumed that after the fall of the Achæmenides, that extension of the original town (afterwards known, and important in history up to within a recent period, as Istakhar), on which were situated the royal edifices and temples used as the royal treasuries up to the time of Epiphanes, gradually fell into decay. The situation of these structures, overlooking the vast luxuriant plain of Merdusht, is described in terms of rapturous enthusiasm by every traveller from Chardin to our own day. Three groups are chiefly distinguishable in the vast ruins existing on the spot. First, the Chehel Minâr (Forty Pillars), with the Mountain of the Tombs (Rachmed), also called Takht-i-Jamshid or the structure of Jamshid, after some fabulous ancient king, popularly supposed to be the founder of Persepolis. The next in order is Naksh-i-Rustam, to the north-west, with its tombs; and the last, the building called the Haram of Jamshid. The most important is the first group, situated on a vast terrace of cyclopean masonry at the foot of a lofty mountain-range. The extent of this terrace

Ruins of Persepolis.

(Copied from Fergusson's *Palaces of Nineveh and Persepolis Restored*.)

is about 1500 feet north-by-south, and about 800 east-by-west, and it was, according to Diodorus Siculus, once surrounded by a triple wall of 16, 32, and 60 cubits respectively in height, for the triple purpose of giving strength, inspiring awe, and defence. The whole internal area is further divided into three terraces—the lowest towards the south; the central being 800 feet square, and rising 45 feet above the plain; and the third, the northern, about 550 feet long, and 35 feet high. No traces of structures are to be found on the lowest platform; on the northern, only the so-called 'Propylæa' of Xerxes; but the central platform seems to have been occupied by the foremost structures, which again, however, do not all appear to have stood on the same level. There are distinguished here the so-called 'Great Hall of Xerxes' (called Chehel Minâr, by way of eminence), the Palace of Xerxes, and the Palace of Darius, towering one above the other in successive elevation from the ground. The stone used for the buildings

is dark-gray marble, cut into gigantic square blocks, and in many cases exquisitely polished. The ascent from the plain to the great northern platform is formed by two double flights, the steps of which are nearly 22 feet wide, 3½ inches high, and 15 inches in the tread, so that several travellers have been able to ascend them on horseback. What are called the Propylæa of Xerxes on this platform are two masses of stone-work, which probably formed an entrance-gateway for foot-passengers, paved with gigantic slabs of polished marble. Portals, still standing, bear figures of animals 15 feet high, closely resembling the Assyrian bulls of Nineveh. The building itself, conjectured to have been a hall 82 feet square, is, according to the cuneiform inscriptions, as interpreted by Rawlinson, the work of Xerxes, and reads as follows:

'The great god Auramazda, he it is who has given this world, and who has given life to mankind, who has made Xerxes king, both king and

at?

lawgiver of the people. I am Xerxes the king, the great king, the king of kings, the king of the many-peopled countries, the supporter also of the great world, the son of King Darius, the Achæmean.

'Says Xerxes the king, by the grace of Auramajda, I have made this gate of entrance; there is many another nobler work besides this Persepolis which I have executed, and which my father has executed;' &c.

An expanse of 162 feet divides this platform from the central one, which still bears many of those columns of the Hall of Xerxes from which the ruins have taken their name. The staircase leading up to the Chehel Minâr, or Forty Pillars, is, if possible, still more magnificent than the first; and the walls are more superbly decorated with sculptures, representing colossal warriors with spears, gigantic bulls, combats with wild beasts, processions and the like; while broken capitals, shafts, pillars, and countless fragments of buildings, with cuneiform inscriptions, cover the whole vast space of this platform, 350 feet from north to south, and 330 from east to west. The Great Hall of Xerxes, perhaps the largest and most magnificent structure the world has ever seen, is computed to have been a rectangle of about 300—350 feet, and to have consequently covered 105,000 square feet, or 2½ acres. The pillars were arranged in four divisions, consisting of a centre group six deep every way, and an advanced body of twelve in two ranks, the same number flanking the centre. Fifteen columns are all that now remain of the number. Their form is very beautiful. Their height is 60 feet, the circumference of the shaft 16, the length from the capital to the torus, 44 feet. The shaft is finely fluted in 52 divisions; at its lower extremity begin a cincture and a torus, the first, two inches in depth, and the latter, one foot, from whence devolves the pedestal, shaped like the cup and leaves of the pendent lotus, the capitals having been surmounted by the double semi-bull. Behind the Hall of Xerxes was the so-called Hall of Hundred Columns, to the south of which are indications of another structure, which Fergusson terms the Central Edifice. Next along the west front stood the Palace of Darius, and to the south the Palace of Xerxes, measuring about 86 feet square, similarly decorated, and of similar grand proportions. —For a further and more minute description, we refer to the travels of Niebuhr, Ker Porter, Rich, and other travellers; to Fergusson's *Palaces of Nineveh and Persepolis Restored*, and to Vaux's *Nineveh and Persepolis*. See also the articles CYRUS, DARIUS, XERXES, CUNEIFORM, and PERSIAN ARCHITECTURE.

PERSEUS, also PERSES, the last king of Macedonia, was the eldest son of Philip V., and was born in the latter part of the 3d c. B.C. He was trained to a military life from his earliest years, and after bringing about the death of his younger brother, Demetrius, who was a favourite both with the Macedonians and the Romans, he succeeded his father on the throne 179 B.C. Philip had long foreseen that a contest between Rome and Macedonia was inevitable, and he had carefully prepared for it, so that P., on his accession, found himself fore-armed. Meanwhile, he governed Macedonia with great prudence and moderation, and became decidedly popular with his subjects and neighbours. Seleucus IV. (Philopator) gave him his daughter Laodice in marriage; Prusias, the Bithynian king, married his sister; the Greek states looked favourably on his projects, and his envoys were well received even at Carthage. The Romans took the alarm, and—after some delusive negotiations—sent an army into Thessaly (171 B.C.). The war lasted four years; in the first three, the advantages were so little on the side of the Romans, that there was a widespread feeling in P.'s favour in the countries bordering on

the Levant and the Archipelago. In the beginning of the fourth campaign (168 B.C.), L. Æmilius Paulus arrived, and took command of the Roman forces. A great battle was fought at Pydna (June 22), in which the army of P. was utterly routed. The king himself was soon afterwards forced to surrender, and conveyed to Rome, where he adorned the triumph of the conqueror. He died in captivity at Alba, a few years later.

PERSEUS, in Grecian Mythology, the son of Zeus and Danaë (q. v.), and grandson of Acrisius. He was brought up at Seriphos, one of the Cyclades, where Polydectes reigned, who, wishing to get rid of him for private reasons, sent him, when yet a youth, to bring the head of the Gorgon Medusa, on the pretence that he wanted to present it as a bridal gift to Hippodamia. P. set forth under the protection of Athene and Hermes, the former of whom gave him a mirror, by which he could see the monster without looking at her (for that would have changed him into stone); the latter, a sickle; while the nymphs provided him with winged sandals, and a helmet of Hades, or invisible cap. After numerous wonderful adventures, he reached the abode of Medusa, who dwelt near Tartessus, on the coast of the ocean, and succeeded in cutting off her head, which he put into a bag, and carried off. On his return, he visited Ethiopia, where he liberated and married Andromeda, by whom he subsequently had a numerous family, and arrived at Seriphos in time to rescue his mother from the annoyance of the too ardent addresses of Polydectes, whom, along with some of his companions, he changed into stone. After this, he went to Argos, from which Acrisius fled to Thessaly, and P. assumed the vacant throne. But this, like many other details of the myth, is differently narrated. P. was worshipped as a hero in various parts of Greece, and, according to Herodotus, in Egypt too. In ancient works of art, the figure of P. much resembles that of Hermes.

PERSEVERANCE OF SAINTS, a doctrine necessarily resulting from the most essential parts of the Calvinistic system, and therefore held by almost all who adopt the Calvinistic or Augustinian doctrines. It is advocated not only by arguments from other doctrines, as those of election, atonement, the intercession and mediatorial dominion of Christ, imputed righteousness, and regeneration, but also from many texts of Scripture, as those which declare *eternal life* to be always connected with believing, and those which encourage the believer to depend on the faithfulness, love, and omnipotence of God. To an objection very commonly urged against it, that it tends to make men careless concerning virtue and holiness, its advocates reply, that this objection is only valid against a doctrine very different from theirs, the true doctrine of Perseverance of Saints being one of perseverance in holiness, and giving no encouragement to a confidence of final salvation which is not connected with a present and even an increasing holiness.

PERSHORE, a market-town in the county of Worcester, and 9 miles south-east of the city of that name, on the Avon. It contains two churches—that of St Andrew's, small and ancient; and the church of the Holy Cross, in Norman and Early English, with a lofty square tower. This church is the only remaining portion of the ancient abbey-church of the same name. Pop. about 3000, who are employed in wool-stapling, in manufacturing agricultural implements, and in raising fruits and vegetables for the markets of the large manufacturing towns in the vicinity.

PER'SIA, called by the natives IRAN (see ARYAN RACE), the most extensive and powerful

native kingdom of Western Asia, is bounded on the N. by the great plain of Khiva, the Caspian Sea, and the Trans-Caucasian provinces of Russia; on the E. by Bokhara, Afghanistan, and Beluchistan; on the S. by the Strait of Ormuz and the Persian Gulf; and on the W. by the Shat-el-Arab and Asiatic Turkey. It contains about 648,000 English square miles, and consists for the most part of a great tableland or elevated plateau, which in the centre and on the east side is almost a dead level; but on the north, west, and south, is covered with a broad belt of mountain-region, here and there interspersed with tracts of desert and small fertile plains. The mountain-system of P. has its root in the north-west corner of the kingdom, and is a continuation of the Taurus, Armenian, and Caucasian chains. The Taurus chain enters P. a little to the north-east of Lake Van (q. v.), and then turns in a south-easterly direction, ramifying into numerous parallel chains, which traverse the west and south of the country, covering it for a width of from 100 to 330 miles. At its south-eastern extremity, this chain joins the Jebel-Abad, which runs eastward through the centre of the province of Kerman, and forms the southern boundary of the plateau. The range is generally limestone, and like all other mountains of the same character, presents many caves and grottoes. The province of Azerbaijan, in the north-west, is almost wholly mountainous. On the east side of Azerbaijan, a spur of the Caucasus, separated from it, however, by the valley of the Kur and Araxes, runs southwards at some little distance from, and parallel to, the shore of the Caspian, at the south-west corner of which it becomes more elevated, and as the majestic range of the Elburz takes an easterly direction, following the line of the Caspian coast at a distance varying from 12 to 60 miles. On reaching Astrabad, it divides into three great parallel ranges of somewhat inferior elevation, which pursue first an east, and then a south-east direction, joining the Paropamisus in Afghanistan. Many of the hills in the Elburz are covered with perpetual snow; and the highest peak, Mount Demavend, is more than 20,000 feet above the sea. The Persian mountains are mostly of a primitive character; granite, porphyry, felspar, and mountain limestone enter largely into their composition; they also, in great part, exhibit indications of volcanic action—Demavend itself being evidently an extinct volcano; and the destructive earthquakes which are still of frequent occurrence in the north and north-west of P., indicate the presence of subterranean fires. The Elburz on the north, the Zagros on the west, the Kerman Mountains on the south, and Afghanistan on the east, are the boundaries of the Persian plateau, which ranges from 2000 to 5000 feet above sea-level, the lowest portion being the Great Salt Desert, in the north-west of Khorassan, which has 2000 feet of elevation above the sea; while the average elevation of the whole plateau above the sea is about 3700 feet. The lower level, out of which the upland rises, is called the *Dushtistan*, or 'Level Country,' and stretches along the coast of the Persian Gulf and Gulf of Ormuz, south of the Bakhtiyari and Kerman ranges, and also along the Caspian Sea, between it and the Elburz. The aspect of the plateau, diversified as it is for the most part with hills and valleys, mountain and plain, is, contrary to what might naturally be expected, dreary and forbidding. The interior mountains are everywhere bare and arid, unrelieved by trees or shrubs, and present the appearance of huge masses of gray rock piled one on the other, or starting in abrupt ridges from the level plain. The plains are equally unattractive; and those which are not deserts,

consist either of gravel which has been washed down from the mountain slopes or accumulated into deep and extensive beds during some former revolution of nature, or of a hard dry clay. To render such a country fertile, requires the presence of abundant water; but unfortunately for P., nature has been remarkably sparing in this respect. The whole of the east and centre of the country is entirely destitute of rivers; the country south of the Kerman Mountains is very meagrely supplied, the rivers, such as they are, being almost wholly confined to the western and the Caspian provinces.

Almost the whole of Khorassan (q. v.), the north half of Kerman (q. v.), the east of Irak-Ajemi (q. v.), which form the great central plain, and detached portions of all the other provinces, with the exception of those on the Caspian Sea, forming more than three-fourths of the surface of P., are desert. In some parts of this waste, the surface is dry, and produces a scanty herbage of saline plants; in other parts, it is covered with salt marshes, or with a dry, hard, salt crust, sometimes of considerable thickness, which glitters and flashes in the sunlight, forcing the traveller on these inhospitable wastes to wear a shade to protect his eyes; but by far the greater portion of this region consists of sand, sometimes so light and impalpable as to be shifted hither and thither by the slightest breeze. This great central desert contains a few oases, but none of great extent. The largest of the salt deserts of P. is the 'Dasht Beyad,' commonly known as the Great Salt Desert of Khorassan, which lies in the north-west of that province, and is 400 miles in length, by 250 miles in breadth.

Some parts of P., however, are of exceeding fertility and beauty; the immense valleys, some of them 100 miles in length, between the various ranges of the Kerman Mountains, abound with the rarest and most valuable vegetable productions; great portions of the provinces of Fars, Khuzistan, Ardelan, and Azerbaijan, have been lavishly endowed by nature with the most luxuriant vegetation; while the Caspian provinces, and the southern slopes of the Elburz, are as beautiful as wood, water, and a fine climate can make them—the mountain-sides being clothed with trees and shrubs, and the plains studded with nature's choicest products.

Rivers.—P. has hardly one river that can properly be termed navigable, though some of them are several hundred miles in length, and of great width and volume of water; the few that are of sufficient importance to deserve mention are—the Karun, which rises in the mountains to the south of Ispahan, flows first west, and then south-south-west, receiving many tributaries in its course, and falls into the Shat-el-Arab (q. v.), near Mohammerah; the Kerkhah (or Karasu of the Turks), nearly equal to the Karun in size, and rising in the same range, which flows first westward, and then south-south-east, watering the west side of Luristan and Khuzistan, and joins the Tigris a little above its junction with the Euphrates; the Kizil-Uzun, or Sefid-Rud ('White River'), which springs from the Sahund range, and flows in an easterly direction, falling into the Caspian Sea a little to the east of Resht. The Aras, or Araxes (q. v.), is by far the largest river in P.; but it can scarcely be considered a Persian river, as it never enters the country, but merely forms, for some distance, the northern boundary towards Russia. The rivers which flow to the southwards receive, in the latter part of their course, few tributaries, and fertilise only a narrow strip of land on each side of them, except when their waters are applied, by means of canals or other works, to the artificial irrigation of the soil. This mode of increasing and extending the

productive powers of the country was much employed in ancient times; but the constant change of masters, and the never-ending disturbances under which P. has so long suffered, led to the neglect of the practice, and most of these specimens of the architectural skill and laborious industry of the ancient Persians are now in a ruinous condition. The Caspian provinces abound in rivers, but the greater number of them, from the proximity of the Elburz Mountains to the Caspian, are mere mountain torrents, which become dry in summer.

Lakes.—P., as a natural consequence of the nature and situation of its surface, abounds with saline lakes, and there are nearly thirty of them having no visible outlets. The chief lake is Lake Urumiah (q. v.), in Azerbaijan. Lake Bakhtegan, in the east of Fars, the receptacle for the drainage of the northern half of that province, is about 60 English miles in length, by 9 in breadth. Lake Shiraz (q. v.) is much smaller.

Climate and Products.—The climate is necessarily very varied. What the Younger Cyrus is reported to have said to Xenophon regarding the climate, 'that people perish with cold at the one extremity, while they are suffocated with heat at the other,' is literally true. P. may be considered to possess three climates—that of the southern Dushtistan, of the elevated plateau, and of the Caspian provinces. In the Dushtistan, the autumnal heats are excessive, those of summer more tolerable, while in winter and spring the climate is delightful. The cold is never intense, and snow seldom falls on the southern slope of the Kerman range. The rains are not heavy, and occur in winter and spring. The district is extremely unhealthy. On the plateau, the climate of Fars is temperate, and as we proceed northwards, the climate improves, attaining its greatest perfection about Ispahan. Here the winters and summers are equally mild, and the regularity of the seasons appears remarkable to a stranger. To the north and north-west of this, the winters are severe; and in Kurdistan, the greater part of Azerbaijan, and the region of the Elburz, the climate is quite alpine. The desert region of the centre and east, and the country on its border, endure most oppressive heat during summer, and piercing cold in winter. The Caspian provinces, from their general depression below the sea-level, are exposed to a degree of heat in summer almost equal to that of the West Indies, and their winters are mild. Rains, however, are frequent and heavy, and many tracts of low country are marshy and extremely unhealthy. With the exception of the Caspian provinces, the atmosphere of P. is remarkable above that of all other countries for its dryness and purity, a fact frequently proved by exposing pieces of polished iron to the action of the air, and finding whether or not they rust.

The cultivated portions of P., when supplied with moisture, are very fertile, producing an immense variety of crops. The chief cultivated products are wheat (the best in the world), barley, and other cereals, cotton (of which, according to the statement of the Persian ambassador at London in 1861, enough could be grown in the southern provinces to supply the manufactories of Western Europe), sugar, rice, and tobacco. The vine flourishes in several provinces, and the wines of Shiraz are celebrated in Eastern poetry. Mulberries are also largely cultivated, and silk is one of the most important products of the kingdom. The forests on the slopes of the Elburz abound with wild animals, as wolves, tigers, jackals, boars, buffaloes, foxes, and the Caspian cat. Lions and leopards also abound in Mazanderan. Among domestic animals, the horse and camel hold the first place. The horses have always been celebrated as the finest

in the East. They are larger and more handsome, but less fleet than the Arabian horses. Immense herds of sheep and goats feed upon the mountain slopes of the southern provinces, and yield their owners a rich product in wool and goat-hair of the very finest quality. The wool of the goats is spun into various fabrics, which, in softness and beauty, almost vie with those of Cashmere. The Caspian rivers abound with fish, especially sturgeon, great quantities of which are cured and exported to Russia. The mineral products of P. are insignificant, with the sole exception of salt. None of the precious metals are found. Iron is abundant in Azerbaijan, but is little worked; copper occurs in considerable quantity in the mountains of Mazanderan and Kerman; and lead, antimony, sulphur, and naphtha also abound. But the most celebrated mineral product of P. is the turquoise, which is found in the Fironz Koh, one of the Elburz Mountains, and in a hill 40 miles west-north-west of Nishapur. The former mine is not now worked, but the mines in the latter place still yield these gems in abundance; and if they were properly worked, the yield might be greatly increased. The gems, however, are generally defaced by flaws, and do not possess a high mercantile value. Marble of different kinds, coal, freestone, and slate, are found in various places. At Dalki, in Fars, are two fountains of bitumen or black naphtha.

Inhabitants.—The population of P. is naturally divisible into two classes, the settled and the nomad. The settled population are chiefly Tajiks, the descendants of the ancient Persian race, with an intermixture of foreign blood—Turkish, Tartar, Arab, Armenian, or Georgian. To this class belong the agriculturists, merchants, artisans, &c. From having long been a subject race, they have to a large extent lost their natural independence and manliness of character, and acquired, instead, habits of dishonesty, servility, and cunning. The Tajiks are Mohammedans of the Shiite sect, with the exception of the few remaining Parsees or Guebres (q. v.), who are found in Kerman and Fars, and still retain their purity of race and religious faith. The nomad or pastoral tribes, or *eylats* (*eyl*, a clan), are of four distinct races—Turkomans, Kurds, Lûrs, and Arabs. Their organisation is very similar to that which formerly subsisted among the Highland clans of Scotland, with the exception that the former are nomad, while the latter inhabited a fixed locality. Each tribe is ruled by its hereditary chief (*ujak*), and under him by the heads of the cadet branches (*tirehs*) of his family. Of the four races, the Turkoman is by far the most numerous, and forms at the present day the ruling race in Persia. The Kurds are few in number, the greater part of their country and race being under the sway of Turkey. The Arabs are also few in number, and at the present day can hardly be distinguished from the Persians, having adopted both their manners and language. The Lûrs are of nearly pure Persian blood. The nomad races, especially the Turkomans, profess the Sunni creed; they are distinguished from the Tajiks by their courage, manliness, and independence of character; but they are inveterate robbers, and since their entrance into the country in the 10th c., it has been continually distracted by civil wars and revolutions. According to a careful estimate, May, 1868, the pop. was 4,400,000, of whom 1,700,000 are nomads. Hitherto the pop. has been estimated at 17 millions, and classed according to their religious belief: 7,500,000 Shiites; 500,000 Shiites not orthodox; 1,500,000 Sunnites. The remaining 500,000 includes Christians of several denominations to the number of 74,000, of whom 26,000 are Armenians, 25,000 Nestorians, 16,000 Jews, and 7000 Guebres.

Notwithstanding its ancient civilisation, almost the same barbarism now prevails in P. as in other Mohammedan countries, and few traces remain of the intellectual culture which in ancient times distinguished the country. The insecurity of property has prevented the improvement of land, the extension of trade, and public works of every kind. The roads are utterly neglected. The houses, those of the wealthiest people not excepted, appear contemptible, being generally built of earth or mud, and are grouped together, even in the principal towns, with little attention to either uniformity or order in their arrangement. They scarcely ever exceed one story in height, and they are surrounded by high blank walls. The public buildings, such as mosques, colleges, and caravansaries, are of similar appearance to the ordinary houses, and built of the same materials. The interior, however, of the houses of the rich are sometimes perfect paradises of luxury and elegance; and however much dwellings constructed of mud may offend a European eye, it is questionable whether, with all its disadvantages, mud is not a better building material than wood or stone in a country possessing such a climate as Persia. The miserable look of the towns is, however, greatly improved by the beauty of the gardens which surround them. These gardens are planted with forest and fruit trees, and some of them, especially in Irak and Kerman, are of rare beauty.

Manufactures and Trade.—The trade of P. is comparatively of little importance. Silk is the great staple, and is produced in every province, but chiefly in those of the north; cotton and woollen fabrics, shawls, carpets, and felts are largely manufactured for use and export in Khorassan. The silk goods, which consist of satin, sarcenet, brocades, velvet, &c., and are made exceedingly strong and durable, are of inferior quality, and are chiefly exported to Turkey and Russia. Trade is carried on by caravans with the interior of Asia and the chief towns of P., such as Tebriz, Abu-Shehr, Ispahan, Shiraz, Teheran, and Kazbin. These caravans exchange the products of P. for muslin, leather, skins, nankeen, china, glass, hardware, gums, dye-stuffs, and spices. The trade of the Caspian Sea is monopolised by the Russians, who visit periodically the three ports of Enzelli, Balfurustsh, and Astrabad. Bushire, Bassorah, and Gombroon are the ports in the Persian Gulf through which trade with India and the other countries on the shores of the Indian Ocean is carried on. The exports consist of raw silk, cotton, tobacco, drugs, &c.; and the imports from India and Europe, of broad-cloths, cotton goods, jewellery, arms, cutlery, watches, earthen, glass, and metal wares, &c. The greater part of the European commerce with P. is now carried on over the northern frontier through Tauris. In 1867 the imports and exports over this frontier were £1,776,694 and £475,678 respectively. The entire external commerce of P. may be valued at £4,000,000.

Government, Taxation, Education, &c.—The government of P. is a pure despotism, limited only by domestic intrigues, dread of private vengeance, and an occasional insurrection. The last-named is the principal check against unjust government on the part of the monarch, while the two former operate as powerful restraints on his ministers. The monarch, who has the title of 'Shah' and 'Padishah,' possesses absolute authority over the lives and property of his subjects; and his deputies, the governors of provinces and districts, possess similar authority over those under them; their actions are, however, liable to revision by the Shah, who may summarily inflict any punishment upon them for real or alleged misgovernment. Oppression of the working and mercantile classes is

almost a necessity of such a form of government. The capitalists of the country, a numerous class, dare not exhibit their wealth, much less invest it in any mercantile transactions, lest they should thereby excite the cupidity of some rapacious governor. The central government consists of the *Sadri-Azem*, or Grand Vizier, who is inferior in authority to the Shah alone; the *Ilimadod-Dowlet*, or Minister for Foreign Affairs; the *Eminet-Dowlet*, or Minister of Finance; the *Nizamed-Dowlet*, or Minister of the Interior; the *Leshker-nourvis*, or War Minister; and various superintendents of the administration of justice, of commerce, agriculture, industry, and public works, the commander-in-chief, and the master of the ceremonies. The law, which in civil cases is administered by Mollahs (q. v.), in criminal cases by a state court, is founded on the Koran and on tradition. The punishments commonly inflicted are fines, flogging (the *bastinado*), and death, either by decapitation, stabbing, or torture. The governors of provinces, who are always chosen from the governing race, the Turkomans, and are generally of the blood-royal, though they oppress to the utmost the poor Tajiks, are seldom able to protect their provinces from the ravages of the predatory *eylat* hordes, who, though nominally subject to the Shah, are governed by their own khans, and are really independent. The revenue is derived from a tax on the gross produce of land, which varies from 10 to 20 per cent. on the whole; from the crown-lands (which are being constantly increased by confiscations); from the church-lands—which since the time of Nadir Shah (q. v.) have been in the hands of the Shah; from a tax on cattle, flocks, and even bees, and many other imposts. There is also a heavy property and income tax; and the various duties which are levied on imports *in transitu* are almost numberless. Besides all these, capitation and door-taxes are levied specially on Armenians, Jews, and Guebres. The revenue derived from these exactions is greatly increased by presents, which all those who are in any way dependent on court-favour are bound to make to the Shah on certain days, and which amount annually to nearly £1,000,000. The revenue is divided into two portions, one of which goes into the 'Spiritual Treasury,' or *Beit-ul-Mâl*, and is expended on mosques, payment of judges and clergy, assistance of poor Moslems, public works and institutions, such as roads, bridges, schools, &c., subsidies to pilgrims to holy places, and to the Prophet's descendants, &c.; the other, which is by far the larger, goes into the crown treasury, which is charged with the maintenance of the Shah, his family, servants, and court, and the defraying of all public expenses, salaries, &c., unconnected with religion. The receipts, in 1868, were calculated to amount to £1,744,664, in money, besides payment in barley, rice, wheat, and silk, valued at £220,336, making a total revenue equal to £1,965. In Persia there is no public debt, and all extra expenses are at once met by extra taxation. The proportion of the revenue which is applied to the support of schools for public instruction, is small, and education is thus necessarily in a very low state. The sciences of astronomy, metaphysics, physics, and mathematics, are nominally studied; but the astronomy consists of the Ptolemaic system, largely intermixed with astrology, and the other sciences as taught are similarly composed of the debris of effete systems and ancient superstitions.

Political Divisions, &c.—From the earliest times down to the present century, P. was divided into seven or eight great divisions; but about the time when it was attempted to introduce European

civilisation into the country, and discipline into the army, the country was anew divided into 25 provinces—viz., the three Caspian provinces of Chilan, Mazanderan, and Astrabad, in the north; Azerbaijan, Ardelan or Persian Kurdistan, Luristan, and Khuzistan, in the west; Fars, Laristan, and Kerman with Mogistan, in the south; while the great province of Irak-Ajemi in the centre was divided into Khamsah, Kasbin, Teheran, Hamadan, Kdm, and Ispahan; and that of Khorassan in the east into Yezd, Tabas, Ghayn and Birjun, Turshiz, Meshid, Damghan, Semnun, and the Dasht Beyad, or the Great Salt Desert. The western and northern provinces are well sprinkled with towns and large villages, but the most of the others consist of little more than the chief town and its suburbs, the rest being either desert, or in the hands of the wild pastoral tribes. There are many interesting ruins of ancient, populous, and celebrated cities in Persia, for example, Persepolis (q. v.), Rhages or Rhé, Shahpur, Istakhar, Tûs, Merv, Shushan, Hamadan, &c.; and the monuments and inscriptions found at some of these places form a highly-interesting study to the historian and the antiquary. See BEHISTUN. In modern times, Tabriz or Tauris, Kazbin, Ispahan, and Shiraz, have been in succession the seats of royalty, and at present Teheran is the favoured city.

Army.—The army consists (1868) of 105,500, of which 70,000 are regular infantry, 30,500 cavalry, regular and irregular, and 5000 artillerymen; of these but one-third are regularly employed, and are contributed by the nomad tribes, being almost their sole acknowledgment of subjection to the Shah. This irregular cavalry, which forms the bravest portion of the Persian army, is equal to the Cossacks in the Russian army, and much superior to the Turkish Sultan's Bashi-Bazouks. Abbas Pasha, the grandfather of the present Shah, attempted to organise a portion of the army according to European tactics, but he was unsuccessful.

History.—According to the *Shah Nameh* of Firdusi (q. v.), the history of P. begins some thousands of years before the Christian era. Little has yet been done towards extracting the grains of historical truth that may be contained in the mass of fable that constitutes the native Persian annals; although hopes are cherished that by aid of the many inscriptions and monuments that are being daily discovered, light may yet be thrown upon many points. In the meantime, we must rest contented with the accounts derived from Greek writers. The north-western part of Iran, anciently called Media (q. v.), was, at the earliest period known to the Greeks, a part of the Assyrian empire, but the Medes revolted, and (708 B.C.), under Dejoces, established an empire which subdued both that of Assyria and their own kindred tribes of Persis. See MEDIA. About 537 B.C., the Persians under CYRUS (q. v.)—the Kai-Khusrd of the Persians—(559—529 B.C.) rebelled, subdued their former masters, the Medes (who from this time became amalgamated with them), and established a mighty empire, which included, besides P., as far as the Oxus and Indus, Asia Minor, Syria, Palestine, and Mesopotamia. His son, CAMBYSES, a most ferocious and blood-thirsty tyrant (529—522 B.C.), subdued Tyre, Cyprus, and Egypt. After the brief rule of the usurper SMERDIS (522—521 B.C.), DARIUS I. (q. v.), surnamed HYSTASPES—the Gushtasp of the Persians—(521—485 B.C.), mounted the throne. He was a politic and energetic prince, and succeeded in firmly establishing his dynasty, and adding Thrace and Macedonia to his empire; but his two attempts to subdue Greece were completely foiled, the first by the Thracians, and the second by the Athenians at

Marathon (490 B.C.). His son, XERXES I. (485—465 B.C.)—the Isfunder of the Persians—renewed the attempt to subdue the Greek states, and though at first successful, the defeats of Salamis and Plataea compelled him to limit himself to a defensive warfare, which exhausted the resources of his kingdom. His son, ARTAXERXES I. (465—425 B.C.), surnamed LONGIMANUS (the Bahman of the Persians, better known as Ardeshir Dirazdust), was a valiant prince, but he was unable to stay the decadence of P., which had now commenced. He, however, crushed a formidable rebellion in Egypt, though his wars with the Greeks and Ionians were unsuccessful. The empire now became a prey to intestine dissensions, which continued during the reigns of his successors, Xerxes II., Sogdianus, Darius II., Artaxerxes II., and Artaxerxes III. DARIUS III. CODOMANNUS (336—329) (the Darab II. of the Persians), the last of the dynasty, was compelled to yield his throne to Alexander (q. v.) the Great, king of Macedon (known as Secunder by the Persians), who reconquered all the former provinces of P., and founded a vast empire, which, at his death in 324 B.C., was divided into four parts, P. along with Syria falling to the share of the Seleucidæ (q. v.), and its old dependency, Egypt, to the Ptolemies (q. v.). The Seleucidæ soon lost Bactria (now Balkh), which became independent under a series of Greek sovereigns; and about 246 B.C., Parthia (q. v.)—now Northern Khorassan—also rebelled under ARSACES I. (the Ashk of the Persian writers), who founded the dynasty of the Arsacidæ, under whom the greater part of P. was wrested from the Greeks, and maintained against both the Greeks and Romans. The Greek empire of Bactria, which is said to have included a great part of Hindustan, was overthrown by an influx of nomad tribes from Turkestan, and these invaders having been driven out by the Parthians, Bactria was added to their empire. But the dynasty of the Arsacidæ was brought to an end by a Persian named Ardeshir Babegan, who managed to gain possession of Fars, Kerman, and nearly the whole of Irak, before Arduan, the Parthian king, took the field against him. At last, a great battle was fought (218 A.D.) on the plain of Hormuz, in which the Persians were completely victorious. Babegan was now hailed as Ardeshir, king of P., and 'Shahan Shah,' or king of kings. The history of this dynasty will be found under the head of SASSANIDÆ. The Sassanian kings raised P. to a height of power and prosperity such as it never before attained, and more than once perilled the existence of the Eastern Empire. The last king was driven from the throne by the Arabs (636 A.D.), who now began to extend their dominion in all directions; and from this period may be dated the gradual change of character in the native Persian race, for they have been from this time constantly subject to the domination of alien races. During the reigns of Omar (the first of the Arab rulers of P.), Othman, Ali, and the Omniades (634—750), P. was regarded as an outlying province of the empire, and was ruled by deputy governors; but after the accession of the Abbasside dynasty (750 A.D.), Bagdad became the capital, and Khorassan the favourite province of the early and more energetic rulers of this race, and P. consequently came to be considered as the centre and nucleus of the califate. But the rule of the califs soon became merely nominal, and ambitious governors, or other aspiring individuals, established independent principalities in various parts of the country. Many of these dynasties were transitory, others lasted for centuries, and created extensive and powerful empires. The chief were the TAHERITES

(820—872), a Turkish dynasty in Khorassan; the SOFFARIDES (Persian, 869—903), in Seistan, Fars, Irak, and Mazanderan; the SAMANI, in Transoxiana, Khorassan, and Seistan; the DILEMI (Persian, 933—1056), in Western Persia; and the GHIZNEVIDES (q. v.), in Eastern Persia. These dynasties supplanted each other, and were finally rooted out by the Seljuks (q. v.), whose dominion extended from the Hellespont to Afghanistan. A branch of this dynasty, which ruled in Khaurezm (now Khiva, q. v.) gradually acquired the greater part of Persia, driving out the Ghiznevides and their successors, the GHURIDES (q. v.); but they, along with the numerous petty dynasties which had established themselves in the south-western provinces, were all swept away by the Mongols (q. v.) under GENGHIS-KHAN (q. v.) and his grandson, Hulaku-khan, the latter of whom founded a new dynasty, the PERSO-MONGOL (1253—1335). This race becoming effeminate, was supplanted by the EYLKHAHIANs in 1335, but an irruption of the Tartars of Turkestan under TIMŪR (q. v.) again freed P. from the petty dynasties which misruled it. After the death of TimŪr's son and successor, Shah Rokh, the Turkomans took possession of the western part of the country, which, however, they rather preyed upon than governed; while the eastern portion was divided and subdivided among TimŪr's descendants, till, at the close of the 15th c., they were swept away by the Uzbeks (q. v.), who joined the whole of Eastern P. to their newly-founded khanate of Khiva. A new dynasty now arose (1500) in Western P., the first prince of which (Ismail, the descendant of a long line of devotees and saints, the objects of the highest reverence throughout Western P.), having become the leader of a number of Turkish tribes who were attached by strong ties of gratitude to his family, overthrew the power of the Turkomans, and seized Azerbaijan, which was the seat of their power. Ismail rapidly subdued the western provinces, and in 1511 took Khorassan and Balkh from the Uzbeks; but in 1514, he had to encounter a much more formidable enemy—to wit, the mighty Selim (q. v.), the Sultan of Turkey, whose zeal for conquest was further inflamed by religious animosity against the Shiites, or 'Sec-tar-ies,' as the followers of Ismail were termed. The Persians were totally defeated in a battle on the frontiers; but Selim reaped no benefit from his victory, and after his retreat, Ismail attacked and subdued Georgia. The Persians dwell with rapture on the character of this monarch, whom they deem not only to be the restorer of P. to a prosperous condition, and the founder of a great dynasty, but the establisher of the faith in which they glory as the national religion. His son Tamasp (1523—1576), a prudent and spirited ruler, repeatedly drove out the predatory Uzbeks from Khorassan, sustained without loss a war with the Turks, and assisted Homayun, the son of Baber, to regain the throne of Delhi. After a considerable period of internal revolution, during which the Turks and Uzbeks attacked the empire without hindrance, Shah Abbas I. the Great (1585—1628), ascended the throne, restored internal tranquillity, and repelled the invasions of the Uzbeks and Turks. In 1605, he inflicted on the Turks such a terrible defeat as kept them quiet during the rest of his reign, and enabled him to recover the whole of Kurdistan, Mosul, and Diarbekir, which had for a long time been separated from P.; and in the east, Candahar was taken from the Great Mogul. Abbas's government was strict, but just and equitable; roads, bridges, caravansaries, and other conveniences for trade, were constructed at immense expense, and the improvement and ornamentation of the towns

were not neglected. Ispahan more than doubled its population during his reign. His tolerance was remarkable, considering both the opinions of his ancestors and subjects; for he encouraged the Armenian Christians to settle in the country, well knowing that their peaceable and industrious habits would help to advance the prosperity of his kingdom. His successors, Shah Sufi (1628—1641), Shah Abbas II. (1641—1666), and Shah Soliman (1666—1694), were undistinguished by any remarkable talents, but the former two were sensible and judicious rulers, and advanced the prosperity of their subjects. During the reign of Sultan Hussein (1694—1722), a weak and bigoted fool, priests and slaves were elevated to the most important and responsible offices of the empire, and all who rejected the tenets of the Shiites were persecuted. The consequence was a general discontent, of which the Afghans (q. v.) took advantage by declaring their independence, and seizing Candahar (1709). Their able leader, Meer Vais, died in 1715; but his successors were worthy of him, and one of them, Mahmud, invaded P. (1722), defeated Hussein's armies, and besieged the king in Ispahan, till the inhabitants were reduced to the extremity of distress. Hussein then abdicated the throne in favour of his conqueror, who, on his accession, immediately devoted his energies to alleviate the distresses and gain the confidence of his new subjects, in both of which objects he thoroughly succeeded. Becoming insane, he was deposed in 1725 by his brother Ashraf (1725—1729); but the atrocious tyranny of the latter was speedily put an end to by the celebrated Nadir Shah (q. v.), who first raised Tamasp (1729—1732) and his son, Abbas II. (1732—1736), of the Suffavean race, to the throne, and then, on some frivolous pretext, deposed him, and seized the sceptre (1736—1747). But on his death, anarchy again returned; the country was horribly devastated by the rival claimants for the throne; Afghanistan (q. v.) and Beloochistan (q. v.) finally separated from P., and the country was split up into a number of small independent states till 1755, when a Kurd, named Kerim Khan (1755—1779), abolished this state of affairs, re-established peace and unity in Western Persia, and by his wisdom, justice, and warlike talents, acquired the esteem of his subjects, and the respect of neighbouring states. After the usual contests for the succession, accompanied with the usual barbarities and devastations, Kerim was succeeded in 1784 by Ali-Murad, Jaafar, and Luft-Ali, during whose reigns Mazanderan became independent under Aga-Mohammed, a Turkoman eunuch of the Kajar race, who repeatedly defeated the royal armies, and ended by depriving Luft-Ali of his crown (1795). The great eunuch-king (as he is frequently called), who founded the present dynasty, on his accession announced his intention of restoring the kingdom as it had been established by Kerim Khan, and accordingly invaded Khorassan and Georgia, subduing the former country almost without effort. The Georgians besought the aid of Russia; but the Persian monarch, with terrible promptitude, poured his army like a torrent into the country, and devastated it with fire and sword; his conquest was, however, hardly completed, when he was assassinated, May 14, 1797. His nephew, Futeh-Ali (1797—1834), after numerous conflicts, fully established his authority, and completely subdued the rebellious tribes in Khorassan, but the great commotions in Western Europe produced for him bitter fruits. He was dragged into a war with Russia soon after his accession, and by a treaty, concluded in 1797, surrendered to that power Derbend and several districts on the Kur. In 1802, Georgia was declared

to be a Russian province. War with Russia was recommenced by P., at the instigation of France; and, after two years of conflicts disastrous to the Persians, the treaty of Gulistan (October 12, 1813) gave to Russia all the Persian possessions to the north of Armenia, and the right of navigation in the Caspian Sea. In 1826, a third war, equally unfortunate for P., was commenced with the same power, and cost P. the remainder of its possessions in Armenia, with Erivan, and a sum of 18,000,000 rubles for the expenses of the war. The severity exercised in procuring this sum by taxation, so exasperated the people, that they rose in insurrection (October 12, 1829), and murdered the Russian ambassador, his wife, and almost all who belonged to, or were connected with the Russian legation. The most humiliating concessions to Russia, and the punishment by mutilation of 1500 of the rioters, alone averted war. The death of the crown-prince, Abbas-Mirza (q. v.), in 1833, seemed to give the final blow to the declining fortunes of P., for he was the only man who seriously attempted to raise his country from the state of abasement into which it had fallen. By the assistance of Russia and Britain, Mohammed Shah (1834—1848), the son of Abbas-Mirza, obtained the crown, but the rebellions of his uncles, and the rivalry of Russia and Britain (the former being generally successful) at the Persian court, hastened the demoralisation of the country. Mohammed was compelled to grant (1846) to Russia the privilege of building ships of war at Resht and Astrabad, and to agree to surrender all Russian deserters, and P. became thus more and more dependent on its powerful neighbour. Nassr-ed Din succeeded to the throne on his father's death in 1848; and the new government announced energetic reforms, reduction of imposts, &c., but limited itself to these fine promises, and on the contrary, augmented the taxes, suffered the roads, bridges, and other public works to go to ruin, squandered the public money, and summarily disposed of all who protested against their acts. In October 1856, the Persians took Herat (q. v.), a town for the permanent possession of which they had striven for a long series of years; and having thus violated the terms of a treaty with Britain, war was declared against them, and a British army was landed on the coast of the Gulf, which, under Generals Outram and Havelock, repeatedly defeated the Persians, and compelled them to restore Herat (July 1857). Since this time, treaties of commerce have been concluded with the leading European powers; and Russia, Great Britain, Turkey, France, and Italy, have consuls in the chief towns, and, with the exception of Italy, are represented by ministers at the court of Teheran.

PERSIAN ARCHITECTURE.

The architecture of Persia is of considerable interest, both on its own account, and as supplementary to and explanatory of that of Assyria, which, together with the similar edifices in Egypt, is the earliest architecture of which we have any knowledge. The buildings of Persia and Assyria closely resemble one another, and, owing to the mode and the materials in which they were constructed, their remains serve to illustrate and complete each other's history. In Assyria, where no solid building-materials exist, the walls are composed of masses of sun-dried brickwork, lined on the inside, to a certain height from the floor, with large sculptured slabs of alabaster. These have been preserved to us by the falling in of the heavy earthen roofs, with

which, as the later Persian buildings explain to us, the Assyrian palaces were covered. The explorations of Layard and Botta, and the specimens brought home by the former, and now in the British Museum, have made these sculptures familiar to us. The subjects usually are large bulls with human or lions' heads; priests with human bodies, and eagles' or lions' heads, performing religious service before the 'sacred tree.' The Assyrian remains are all of palace-temples, buildings somewhat resembling the Egyptian temples (which were also palaces); and many of the sculptures represent the exploits of the king in war and in peace. The palaces are always raised on lofty artificial mounds, and approached by magnificent flights of steps.

The buildings of Assyria extend over a very long period, the oldest at Nimroud being from 1300 to 800 B.C., and the more recent at Khorsabad and Koyunjik from 800 to 600 B.C. To these succeeded Babylon in the reign of Nebuchadnezzar, and the Birs Nimroud; but these are mere masses of decomposed brickwork, without any sculptures of harder material.

After Babylon came Pasargadæ—where the splendid palaces of Cyrus and Cambyses still exist in ruins—and Persepolis, the capital of Darius and Xerxes (560—523 B.C.), and some remains are still to be found at Susa, Ecbatana, and Teheran. At Persepolis, we find the very parts preserved which at Nimroud and Khorsabad are wanting; for here there is abundance of stone, and the pillars, walls, doorways, &c. (which, in the early examples, were no doubt of wood, and have decayed), being of stone, are still preserved. This has enabled Mr Fergusson to 'restore' these buildings, and to produce most interesting designs, shewing not only how the palaces of Persia were constructed and lighted, but from them to suggest how the arrangements of all the ancient architecture of Egypt and Syria must have been designed.

The halls at Persepolis were square in plan, having an equal number of pillars in each direction for the support of the roof, which was flat. In the centre, a portion was left open for the admission of light, and sheltered by another roof raised upon pillars. The accompanying section (fig. 1) of the Great Hall of Xerxes (from Fergusson's *Handbook of*

Fig. 1.—Section of Hall of Xerxes at Persepolis.

Architecture) will explain this arrangement. This hall is the most splendid building whose remains exist in this part of the world. The remains of the 72 columns with which it was adorned are still extant (fig. 2). The hall had 36 columns, six on each side, and on three sides had an external portico, each with two rows of six columns. These columns had capitals, composed of bulls' heads and shoulders (fig. 3), between which the beams of the roof rested; while others were ornamented with scrolls like the Ionic order (fig. 4). The bases also are suggestive of the origin of that Greek style. This hall was 350

met by 300, and covered more ground than any similar buildings of antiquity, or any mediæval cathedral except that of Milan. The palaces of

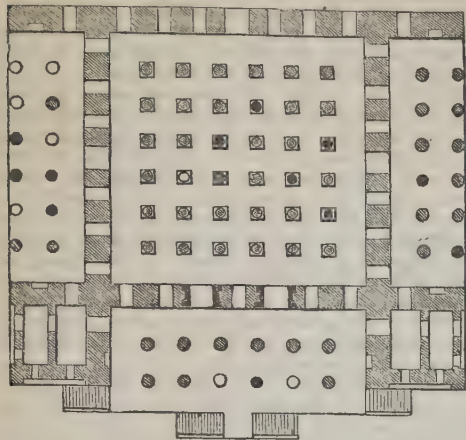

Fig. 2—Plan of Great Hall of Xerxes at Persepolis.

Persepolis stand on lofty platforms, built with walls of Cyclopean masonry, and approached by magnificent flights of stairs, adorned, like the palaces, with

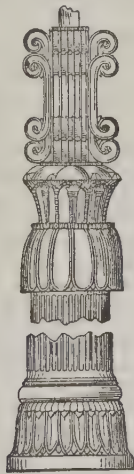

Fig. 4.

Details of Persian Architecture.

sculptures somewhat similar to those of Assyria. The interiors were ornamented with paintings. The use of the arch was known in Assyria, as has been shewn by the subterranean arched conduits discovered by Layard, and the gates of Khorsabad discovered by M. Place. The arches of the latter spring from the backs of sculptured bulls, and are beautifully ornamented with enamelled bricks.

PERSIAN GULF, an arm of the Indian Ocean which penetrates between Arabia and Persia to the extent of 650 English miles in a general north-westerly direction. Its breadth varies from 55 miles at the mouth to 250 miles, and the area is estimated at 117,300 square miles, from which about 1930 square miles must be subtracted for the islands, which are scattered over the western half, or lie close inshore along the eastern side. The chief

of these islands are Ormuz (q. v.), at the mouth; Kishm, 810 square miles in extent; and the Bahreir Islands (q. v.), chief of which is Samak. The Great Pearl Bank stretches along the western side from Ras Hassan to nearly half-way up the gulf. The coast is mostly formed of calcareous rocks. On the Arabian side, it is low and sandy, occasionally broken by mountains and cliffs; while, on the Persian side, it is higher and abrupt, with deep water close inshore, owing to the mountain-ranges of Fars and Laristan running close to the water's edge. The islands are partly of limestone and partly of ironstone, and are generally destitute of springs, barren, desolate, and presenting numerous traces of volcanic eruptions. With the exception of the Shat-el-Arab (q. v.), the P. G. receives only insignificant streams. Its eastern side presents abundance of good anchorage, either in the numerous bays or in the lee of islands. The greater portion of its shores now belongs to the Imaum of Muscat. The coasts of the gulf have been explored by successive British expeditions, the last of which, in 1821–1825, made a complete trigonometric survey of the Arabian shore. The order of the periodic currents in this gulf is precisely the reverse of that of the Red Sea (q. v.) currents, as they ascend from May to October, and descend from October to May.

Oriental geographers give to this gulf the name of the 'Green Sea,' from a remarkable strip of water, of a green colour, which lies along the Arabian coast. It is strange that from the time of Nearchus, the admiral of Alexander the Great, who was the first to make the P. G. known to Europeans, the Persians have never ruled supreme over its surface.

PERSIAN LANGUAGE AND LITERATURE.

The ancient and modern idioms of Persia, which are in general designated as Iranian or West Aryan, belong to the great class of the Indo-Germanic languages; but the term Persian itself applies more particularly to the language as it is now spoken, with a few exceptions, throughout Persia, and in a few other places, formerly under Persian dominion, like Bokhara, &c. The more important and better-known of the ancient idioms are (1) the *Zend* (the East Iranian or Bactrian language, in two dialects—the 'Gātha idiom,' and the 'ancient' or 'classical *Zend*'), which died out in the 3d c. B. C.—one of the most highly-developed idioms, rich in inflections, in the verbs as well as in the nouns, and in the former almost completely agreeing with Vedic Sanscrit; yet such as we find it in the small remains which have survived, it is no longer in the full vigour of life, but almost decaying, and grammatically somewhat neglected; it is in fact held by a great authority on the subject (Haug), that the grammar was never fixed in any way by rules. To increase the difficulty still more, the texts—the Zoroastrian books—never seem to have been copied with proper care, or by men who had any correct knowledge of the language; so that the critical restoration of the literary remains is matter of extreme difficulty, and *Zend* studies in general may be said to be in their infancy yet. Geographically, this idiom may be placed in Northern Persia. Its alphabet is of Semitic origin, and the writing goes from right to left (see *ZEND*, *ZEND-AVESTA*). (2) *Ancient Persian*, the chief remnants of which are found in the cuneiform inscriptions of the time of the Achæmenides, discovered in the ruins of Persepolis, on the rock of Behistun, and some other places of Persia (see *CUNEIFORM*). Some relics, chiefly consisting of proper names for gods and men, and terms for vessels and garments, have survived in the writings of the classical period, and in the Bible, chiefly in Daniel. This idiom is much

nearer to Zend and Sanscrit than to modern Persian. It has still the structure of an ancient organic Indo-Germanic language, with the distinct peculiarities of an Iranic tongue. (3) *Pehlevi* (q. v.) (West Iranian, Median, and Persian), in use during the period of the Sassanides (3d to 7th c. A. D.), an idiom largely mixed with Semitic words, and poorer in inflections and terminations than Zend. Its remnants consist of a certain number of books relating to the Zoroastrian religion, of coins and inscriptions; and the language is not quite the same in all cases—according to the larger or smaller infusion of foreign words. The non-Iranian element is known as *Huzvareh*, and is simply Chaldee; while the Iranian element is but little different from modern Persian. There are three distinct idioms to be distinguished in *Pehlevi*, and the writing varies accordingly, yet it is not certain whether the difference arises from their belonging to different districts or periods. When, however, *Pehlevi* ceased to be a living language, and the restoration of the pure Iranian had begun, people, not daring to change the writings, chiefly of a sacred nature, as they had descended to them from the Sassanian times, began to substitute, in reading, the Persian equivalents to the *Huzvareh* words. At last a new form of commentaries to the sacred writings sprang up, in which more distinct and clear Zend characters were used, where each sign has but one phonetical value, and where all the foreign *Huzvareh* words were replaced by pure Persian ones; and this new form was called (4) *Pâzend*. The transition from the ancient to the modern Persian is formed by the *Parsee*, or, as the Arabs call it, *Farsi*, in use from 700 to 1100 A. D., once the language purely of the south-western provinces, and distinguished chiefly by a peculiarity of style, rigid exclusion of Semitic words, and certain now obsolete forms and words retained in liturgic formulas. It is the Persian once written by the *Parsees* or fire-worshippers, and is in other respects very similar to the present or *modern Persian*, the language of *Jâmi*, *Nizâmi*, and *Hâfiz*—from 1100 to the present time—with its numerous dialects. The purest dialect is said to be that spoken in Shiraz and Ispahan and their neighbourhood. In general, the language is pronounced by universal consent to be the richest and most elegant of those spoken in modern Asia. It is the most sonorous and muscular, while at the same time it is the most elegant and most flexible of idioms; and it is not to be wondered at, that, throughout the Moslem and Hindu realm, it should have become the court language, and that of the educated world in general; holding a position somewhat similar to that which the French language held up to within a recent period in Europe. Its chief characteristic, however, is the enormous intermixture of Arabic words, which, indeed, almost make up half its vocabulary. Respecting its analytical and grammatical structure, it exhibits traces only of that of the ancient dialects of Zend and Achæmenian, of which it is a direct descendant. The elaborate system of forms and inflections characteristic of those dialects has been utterly abandoned for combinations of auxiliary words, which form independent connective links, and which impart fulness and an incredible ease to speech and composition, but which, at the same time, correspond as little to the classical notion of inflection. The grammar of the Persian language has been called 'regular;' but the fact is, that there is hardly any grammar worth mentioning—at all events, no grammar the rules of which could not be mastered in the briefest possible period. To begin with: there is no gender

distinguished in declension; the plural is always formed in the same manner, the only distinction consists in animate beings receiving the affix *ân*, while the inanimate are terminated in *hâ*; further, that instead of the inflection in the different cases found in the ancient languages, either a *mar* (hitherto unexplained) is prefixed, or a *râ* (*râh* = way, by reason of, *Pehlevi*, *Parsi*) is affixed. Between the genitive and the word which governs it, also between a noun and its following adjective, an *i* is inserted. This is the whole declension, not only of the noun, but also of the adjective and pronoun. The comparative is formed, as in the mother-tongues, by the addition of *ter*; the superlative adds *terin*, which is New-Persian exclusively. Not even the pronouns have a gender of their own; the distinction between masculine and feminine must be expressed by a special word, denoting male or female. There is no article, either definite or indefinite. Singularity of a noun is expressed by an appended *ê*, a remnant of *âeva*, one. The flexion of the verb is equally simple. There is a set of personal terminations for all tenses:—*am*, *i*, *ad* or *ast*; *êm*, *êd*, *nd*; the infinitive ends in *tan* or *dan*, the past participle in *tah* or *dah*. The aorist is formed by adding to the root the terminations *am*, *i*, *ad*; *em*, *ed*, *and*; the preterite by dropping the *n* of the infinitive, and substituting the usual terminations. The prefix *mi* or *hami* (*Parsi* and *Huzvareh* = always) transforms the preterite into the imperfect; while the prefix *bi* or *bih* (the present of the verb 'to will') alters the aorist into the simple future. The other tenses are compounds of the past participle and auxiliary verbs, as in the Teutonic and other modern tongues. The passive is formed by the various tenses of the verb *shudan*, 'to be, to go, to beware,' being placed after the past participle. As to syntax, there is none, or, at all events, none which would not come almost instinctively to any student acquainted with the general laws of speech and composition. As the time of its greatest brilliancy may be designated that in which Firdusi wrote, when Arabic words had not swamped it to the vast degree in which it is now found, and were still, as far as they had crept in, amenable to whatever rules the Persian grammar imposed upon the words of its own language.

In the history of the Persian writing, three epochs are to be distinguished. First, we have the Cuneiform (q. v.), by the side of which there seems, however, to have been in use a kind of Semitic alphabet for common purposes. This, in the second period, appears to have split into several alphabets, all related to each other, and pointing to a common Syriac origin (such as the different kinds of *Pehlevi* characters and the Zend alphabet) cleverly adapted to the use of a non-Semitic language. In the third period, we find the Arabic alphabet enlarged for Persian use by an addition of diacritical points and signs for such sounds as are not to be found in Arabic (*p*, *ch*, *zh*, *g*). The characters are written in a somewhat more pending manner (*Talik*) in Persian, and the writing is thus slightly different from the usual Arabic *Neski*.

The much-spoken-of close connection between German and Persian—both of Indo-Germanic kin—is neither more nor less than a popular fallacy, caused by a misunderstood dictum of Leibnitz: 'Integri versus Persice scribi possunt quos Germanus intelligat,' which was enthusiastically taken up and 'proved' by Adelung, Hammer-Purgstall, and others, and which has even led to the assumption, that the Germans came direct from Persia, or that the Goths once were mixed with the Persians. We only mention it as a philological absurdity of bygone days.

Of the literature of the Persians before the

Mohammedan conquest, we shall not speak here, but refer to the special articles ZEND, PEHLEVI, PARSEES, &c. The literary period now under consideration is distinguishable by the above-mentioned infusion of Arabic words into the Persian language, imported together with the Koran and its teachings. The writers are, in fact, one and all, Mohammedans. With the fanaticism peculiar to conquering religions, more particularly to Islam, all the representatives of old Persian literature and science, men and matter, were ruthlessly persecuted by Omar's general, Saad Ibn Abi Wakkas. The consequence was, that for the first two or three centuries after the conquest, all was silence. The scholars and priests who would not bow to Allah and his Prophet and to the new order of things, and who had found means to emigrate, took with them what had not been destroyed of the written monuments of their ancient culture; while those that remained at home were forced to abandon their wonted studies. Yet, by slow degrees, as is invariably the case under such circumstances, the conquered race transformed the culture of the conquerors to such a degree, that native influence soon became paramount in Persia, even in the matter of theology—the supreme science. It is readily granted by later Mohammedan writers, that it was out of the body of the Persians exclusively that sprang the foremost, if not all, of the greatest scholars and authors on religious as well as grammatical subjects, historians and poets, philosophers and men of science; and the only concession they made consisted in their use of the newly-imported Arabic tongue. A further step was taken when, after the Islam sway had ceased, the Persians, under upstart native dynasties, returned also to the ancient language of their fathers during the first centuries of Mohammedanism. The revived national feeling, which must have been stirring for a long time previously among the masses, then suddenly burst forth in prose and in verse, from the lips of a thousand singers and writers. The literary life of Persia, the commencement of which is thus to be placed in the 9th c. A.D., continued to flourish with unabated healthy vigour for five centuries, and produced a host of writers in every branch of science and belles-lettres, of whom we can only here give the most rapid of surveys, referring for the most important names to the special articles throughout this work. Beginning with poetry, we hear, under the rule of the third of the Samanides, Nasr (about 952), of Abul Hasan Rudégi, the blind, who rose by the king's favour to such an eminence that he had 200 slaves to wait upon him. But little has remained of his 1,300,000 distichs, and of his metrical translation of Bidpai's Fables. About 1000 A.D., we hear of Kabus, the Dilemite prince, as the author of *The Perfection of Rhetoric*, and Poems. In the time of the Gasnevides, chiefly under Mahmud, who surrounded himself with no less than 400 court-poets, we find those stars of Persian song, Ansari (1039), the author of *Wamık and Asra*, and 80,000 other distichs and Kassidahs in honour and praise of the king; further, Ferruchi, who, besides his own poems, also wrote the first work on the laws of the Persian metrical art; and above all Firdusi (q. v.), that greatest epic poet, the author of the *Shah-Nameh*, or Book of Kings; who led one of the most brilliant and romantic lives that ever fell to the lot of genius, and ended it forgotten and in misery. With him, but darkened by his brightness, flourished Esedi, his countryman, from Ins. Among the poets who flourished under the Atabek dynasty, we find that most brilliant Persian panegyrist, Anhad Addin Enveri, who, with his praise, well knew how to handle satire. The best

of the older mystic poets of that period is Senayi, author of 30,000 distichs, who for his poem *Hadi-kat* was nominated official singer of the Sufis. Nizami (about 1200) is founder of the romantic epics; the greater part of his *Chamshe*, or collection of five romantic poems (*Chosru and Shirin*, *Mejmun and Leila*, &c.), being almost as well known in Europe as it is in the East; and to whom Kisilarslan the king presented for one of these poems no less than fourteen estates. His grave at Gendshah is still visited by many a pious pilgrim. And here we must mention that the branch of eastern theosophical literature pre-eminently cultivated in Persia is the mystic (Sufistic) poetry, which, under Anacreontic allegories, in glowing songs of wine and love, represented the mystery of divine love and of the union of the soul with God (see *SUFISM*). In this province we find chiefly eminent poets like Senâji (about beginning of 13th c.), and Ferid Eddin Attar (born 1216), the renowned author of *Pend Nameh* (Book of Counsel), a work containing the biographies of saints up to his day. His principal strength, however, lay in his mystic poems; and such are the depth and hidden meaning of his rhymes, that for centuries after him, the whole Moslem world has busied itself with commentaries and conjectures on the meaning of a great part of his sacred poetry. He died about 1330, more than a hundred years old, as a martyr. Greater still, in this peculiar field, is Djalal Eddin Rumi, born at Balkh (died 1266), the founder of a still existing most popular order of dervishes (Mewlewi). His poem on *Contemplative Life* has made him the oracle of oriental mysticism up to this day. He wrote also a great number of lyrical poems, which form, as far as they have been collected for this special purpose, a breviary for the faithful Sufi. Anhad of Meraga (died 1297) also deserves mention.

The 13th c. cannot better be closed than with Sheik Muslih Eddin Sadi of Shiraz (died 1291), the first and unrivalled Persian didactic poet. His *Bostan* and *Gulistan* (Rose- and Fruit-Garden) are not only of Eastern but also of European celebrity, and most deservedly, embodying as they do all the mature wisdom, the grace and happiness of composition of a true poet, ripe in years as in experience. At the beginning of the 14th c., we meet several meritorious imitators of Sadi in didactic poetry.

But far above all these, as above all other Persian lyrical and erotic poets, shines Hafiz (q. v.), the 'Sugar-lip,' who sang of wine and love, and nightingales and flowers, and who so offended mock-piety, that it even would have tried to refuse him a proper burial, had not the oracle of the Koran interposed. After him, the full glory of Persian poetry begins to wane. Among those that came after him, stands highest Djâmi, who died in 1492, a poet of most varied genius, second only in every one of the manifold branches to its chief master—in panegyric to Enveri, in didactic to Sâdi, in romance to Nizami, in mysticism to Jelal-ed-din, in lyric to Sâdi; and he, with these and Firdusi, form the brightest representatives of Persian poetry. Most brilliant, however, is Djâmi as a romantic poet. Of prose works, we have by him a history of Sufis, and an exceedingly valuable collection of epistolary models. Before concluding this branch of literature, we must take notice of the dramatic poetry of the Persians, which is not without merit, but of small extent, and to be compared principally with the ancient French mysteries.

The numerous tales, stories, novels, anecdotes, anthologies, and all the miscellaneous entertaining literature in which Persia abounds—and of which the best known, perhaps, are the adaptation of Bidpai's

Tables; *Anvari Suheili*, by Husein Vais Kashifi; the *Tutuinameh*, or Book of Parrots, a collection of fairy tales, by Nechshebi; the *Behari-Danish*, by Inajeth Allah, &c.—form a fit transition from poetry to prose, for little more is to be said of Persian poetry after the 15th century. Modern imitations of ancient classical works, such as the New Book of Kings, the *Shahinshah-Nameh*, which treats of modern Persian history; the *George Nameh*, which sings the English conquests in India, &c., are hardly worth pointing out in so brief a summary as ours. Of native writers on the poets, are to be named Dewlet Shah (who describes the poets from the 10th to the 15th centuries), Sam Mirsa (the poets of the 16th), and Luft Ali Beg (the poets of modern time). In prose, it is chiefly history which deserves our attention. Able rivals of the great Arabic historiographers sprang up at an early period. For the mythical times, or those of which no knowledge, save through a medium of half-legend, has reached later generations, Firdusi's gigantic epos remains the only source. But after the chroniclers we find Fadhl Allah Reshid Eddin, the vizier of Ghazan, born 1247 at Hamadan, who was executed in 1320. He wrote the *Collector of Histories*, in three volumes, to which he afterwards added a fourth geographical volume: a summary of the history of all Mohammedan countries and times, containing besides a complete history of sects. Worthy and contemporaneous rivals are Fachr Eddin Mohammed Bina Kiti, author of a universal history; and Khodja Abdallah Wassaf, the panegyrist, the model of grand and rhetorical style. His most successful imitator in the 14th c. is Abdel Ressak; and in the 15th; Sheref Eddin Ali Yezdi, who wrote the history of Timar. Up to that period, pomposity of diction was considered the principal beauty, if not the chief merit, of a classical Persian history. From the 16th c. downwards, a healthy reaction set in, and simplicity and the striving after the real representation of facts, became the predominant fashion. As the *facile princeps* among these modern historians is to be mentioned Mirkhond, whose Universal History (*Kanset Essafa*) comprises the period from creation to the reign of Sultan Hasan Beikara, in seven books. After him are to be mentioned his son Khondemir, Gaffari, Moslih Eddin Mohammed Lari, and Abu Tahir of Tortosa in Spain, who wrote the *Derab Nameh*, a biographical work on the Persian and Macedonian kings, and the ancient Greek physicians and philosophers.

Among Indian historians—and they form a most important class—who wrote in Persian, we have Mohammed Kasim Ferishtah (1640), who wrote the ancient history of India up to the European conquest; Mohammed Hashim, Abul Fadel Mobarrek (*Akbar Nameh*); further, Abdel Ressak (*History of the Padishahs*), Mirza Mehdi, Gholam Hussein Khan, and others. One of the most recent works of this description is the *Measiri Sultaniye*, which contains the history of the present dynasty of Persia, and which was published in Teheran, 1825, and translated by Bridges (Lond. 1833).

Biographies, legends, histories of martyrs, and the like are legion. Most of the biographies of the Prophet, however, are taken from the Arabic.

Little is to be said of Persian productions on special branches of exact science. There are a few works on geography—more generally treated together with history—such as those of Mestafi, Ahmin Ahmed Rasi, Berdshendi, &c. In theology, little beyond translations of the Koran, and a few commentaries on single chapters, and of some portions of the Traditions (*Sunnah*), has been produced—the Arabic works being completely sufficient, in religious matters, for all Mohammedans.

For the history of early Persian religion are of importance the *Ulemai Islam* and the *Dabistan*, a description of all the creeds of the East. Jurisprudence has likewise to shew little that is original, and not mere translation, partial commentary, or adaptation in Persian. The *Hedadshah*, the *Inadshah*, the *Fulawa Alemgiri*, are the most important legal works to be mentioned here. A great deal has been done in the field of medicine, surgery, pharmacy, physical sciences, by Persians; but nearly all their chief works being written in Arabic, they do not concern us here. Mathematics, astronomy, and philosophy, have received due attention; rhetoric, the art of letter-writing, metrical and poetical arts, have likewise been cultivated with great assiduity, but few standard works are to be enumerated. Grammar and lexicography found their principal devotees in India; and of dictionaries, the *Perhengi-Shiuri*, *Burhani Katiu*, and principally the *Hefi Kulzum* (the Seven Seas), by the Sultan of Oude, deserve attention. Translations from Greek, Indian, Arabic, Turkish, and other works into Persian, exist in great abundance, and some of them have paved the way to the knowledge of the original sources in Europe.—Chief authorities and writers on the subject of Persian Language and Literature, are Meninsky, Richardson, Lumsden, Forbes, Silvestre De Lacy, Hammer-Purgstall, Briggs, Jones, Duperron, Stewart, Quatremère, Wilken, Defrémery, Vullers, Iken, Kosegarten, Onseley, Chodzko, Bland, Sprenger, Graf, Brockhaus, Dorn.

PERSIAN POWDER, a preparation of the flowers of the composite plant, *Pyrethrum carneum* or *roseum*, which are dried and pulverised. This powder has wonderful efficacy in destroying noxious insects, and is extensively used for that purpose in Russia, Persia, and Turkey. It has lately been introduced into France and Britain, and promises to be of great use, not only in ridding houses of their insect pests, but in aiding the horticulturist in protecting his plants. The plant is a native of the Caucasus, where the flowers are gathered wild, and sent to be manufactured chiefly at Teflis. It might readily be cultivated in this country, where its value for destroying moths alone would render it a profitable crop. Its habit is very similar to that of camomile.

PERSIGNY, JEAN GILBERT VICTOR, COMTE DE, whose proper name was FIALIN, a noted adherent of the Emperor Napoleon III., was born at Saint-Germain-Lespinasse, in the department of Loire, 11th January 1808, entered the *École de Cavalerie* at Saumur in 1826, and obtained an appointment to the 4th regiment of hussars in 1828. At this period, Fialin was royalist in his politics; but he soon changed to a liberal, and took an active part in the July revolution. Insubordination, however, led to his final expulsion from the army in 1833. After a brief trial of Saint-Simonianism, Fialin was converted to the Bonapartist cause, dropped the name of Fialin, and took up that of P. (from an 'hereditary estate'), with the title of Vicomte. Introduced to Louis Napoleon by the ex-king Joseph, he at once formed the most intimate relations with the Prince, and commenced a career of Bonapartist propaganda throughout France and Germany, in which he displayed extraordinary energy, pertinacity, and fertility of resource. He had the chief hand in the affair of Strasburg, and subsequently apologised for its humiliating failure in a pamphlet entitled *Relation de l'Entreprise du Prince Napoléon Louis* (Lond. 1837), in which he throws the blame of the disaster on 'Fate.' He also took part in the descent on Boulogne, where, like his master, he had the misfortune to be captured, and was condemned to twenty years

imprisonment. His confinement, however, after a short time, became almost nominal, and he beguiled his leisure by literary study, a partial result of which may be seen in his voluminous memoir, addressed to the Institute, on the *Utilité des Pyramides d'Égypte* (1844). On the breaking out of the revolution in 1848, P. hurried to Paris, and set himself, with all his accustomed vigour and swiftness, to organise the Bonapartists. It is hardly too much to affirm that it was this dexterous agitator who made his master President of the Republic. He was then appointed aide-de-camp to the President, and Major-general of the Parisian National Guard—perhaps with a view to future contingencies. In 1849, he was chosen a member of the Legislative Assembly, and immediately signalled himself in parliament, as he had previously done out of doors, by his absolute devotion to the policy of the Elysée. He was sent to Berlin as ambassador at the close of the same year, and afterwards held other high diplomatic offices; took a prominent part in the *coup d'état* of December 1851; and, in January 1852, succeeded M. de Morny as Minister of the Interior. On the 27th of May following, he married a grand-daughter of Marshal Ney, when the president conferred on him the title of *Comte*, and presented him with 500,000 francs. In 1855 and in 1859 he became ambassador at the English court, was re-appointed Minister of the Interior in 1860, but removed in June, 1863, and left the most favourable impression on English statesmen by his talent and diplomatic tact. In all political emergencies, he was the most confidential and the soundest adviser of the emperor; he also entered heartily into his liberal commercial reforms; and though an implacable opponent of the extreme or anarchic republicans, he was (like a true disciple of Bonaparte) unfavourably disposed towards the ultramontane party of the church, as his sharp treatment of the *Société de Saint-Vincent de Paul* demonstrated. See M. Delaroc, *Le Duc de Persigny et l'Empire*, 1866. He died in 1872.

PERSIMON. See DATE PLUM.

PERSIUS (Aulus Persius Flaccus), one of the most famous Roman satirists, was born at Volaterræ in Etruria, 34 A. D. He was of a distinguished equestrian family, was educated under the care of the Stoic, Cornutus, lived on terms of intimacy with the most distinguished personages of his time in Rome, among whom were Lucan and Seneca, and died 24th November 62 A. D., in the 28th year of his age. The principal authority for the life of P. is an abridgment of a 'commentary' by one Probus Valerius, which presents the character of the satirist in a most amiable light. Modest and gentle in his manners, virtuous and pure in his whole conduct and relations, he stands out conspicuously from the mass of corrupt and profligate persons who formed the Roman 'society' of his age; and vindicated for himself the right to be severe, by leading a blameless and exemplary life. His six Satires are very commonly printed with those of Juvenal. They were immensely admired in P.'s own day, and long after, all down through the middle ages. The Church Fathers, Augustine, Lactantius, and Jerome, were particularly fond of him—the latter, it is said, has quite saturated his style with the expressions of the heathen satirist; but the estimate which modern critics have formed of his writings, in a literary point of view, is not quite so high. They are remarkable for the sternness with which they censure the corruption of morals then prevalent at Rome, contrasting it with the old Roman austerity and with the Stoic ideal of virtue. The language is terse, homely, and sometimes obscure, from the nature of the allusions and the expressions

used, but his dialogues are the most dramatic in the Latin tongue. The *editio princeps* appeared at Rome in 1470; later editions are those of Isaac Casaubon (Par. 1605), Passow (Leip. 1809), Jahn (Leip. 1843), and Heinrich (Leip. 1844). P. has been frequently translated; as many as fourteen English, twenty French, and considerably more German versions, being known. The two best English ones are those by Dryden and Gifford.

PERSON (Lat. *persona*, a mask) has come, from its original signification, to be applied to the individual wearing the mask, and thus to mean in general an individual, or a numerically distinct being. Beyond the idea of individuality, it involves that of a sentient or intelligent nature, in which it differs from 'substance' or 'thing.' The theological use of the word, although strictly identical with its philosophical signification, is made difficult of apprehension from its being applied to the Christian doctrine of the Trinity, which in itself involves a mystery. Nevertheless, when theologians declare that there are Three Persons in one God, they intend to strictly convey that each of the Three Persons is a Being individually subsisting and numerically distinct; and the difficulty of apprehension is derived, not from these terms, but from the reconciliation of the numerical distinction of Persons with the unity of the Divine Nature.

The name *Persona*, Person, was first applied to the Trinity by the Latins; the corresponding Greek word, *Prosôpon*, being of later use. The earlier Greek Fathers used the word *Hypostasis*, substance, where the Latins used *Persona*, and considerable controversy for a time grew out of this diverse use. It became apparent, however, that the difference was but of words; and after the condemnation of the Sabellian heresy (see SABELLIANISM), and still more after the council of Nicea, all ambiguity of words being at an end, the controversy turned upon the substance of the doctrine, in the well-known form of the Arian controversy. See ARIUS.

PERSONAL ACTIONS, in English Law, are actions which are brought to try the right to damages for breach of contract, or for injuries to the person or personal estate; in contradistinction to real actions, which were designed to try the right and title to real property.

PERSONAL EXCEPTION means, in the Roman law, a ground of objection which applies to an individual, and prevents him doing something which, but for his conduct or situation, he might do. The term is adopted in the law of Scotland. In England, it is generally called an estoppel. Thus, a person who executes a deed is prevented by personal exception or estoppel from disputing the obligation thereby contracted, unless a case of fraud be made out.

PERSONALTY, in English Law, means all the property which, when a man dies, goes to his executor or administrator, as distinguished from the realty, which goes to his heir-at-law. Personality consists of money, furniture, stock in the funds; while realty consists of freehold land and rights connected with land. See **TESTACY**, **KIN**, **NEXT OF**.

PERSONIFICATION (called by the Greeks *Prosopopœia*) is a figure of rhetoric by which inanimate objects, or mere abstract conceptions, are invested with the forms and attributes of conscious life. Oratory and poetry often derive great power and beauty from the employment of this figure. Nowhere do we find more sublime examples than in the Hebrew Scriptures, e.g., 'The sea saw it, and fled.' Such abstract conceptions as Wisdom, Justice

Charity, are often personified in the gravest and most argumentative compositions.

PERSONNEL, in speaking of an army, represents the officers and soldiers, as opposed to the *matériel*, in which are comprised the guns, provisions, wagons, and stores of every description.

PERSPECTIVE (Lat. *perspicio*, I look through), is the art of representing natural objects upon a plane surface in such a manner that the representation shall affect the eye in the same way as the objects themselves. The distance and position of objects affect both their distinctness and apparent form, giving rise to a subdivision of perspective into *linear perspective*, which, as its name denotes, considers exclusively the effect produced by the position and distance of the observer upon the apparent form and grouping of objects; while *aërial perspective* confines itself to their distinctness, as modified by distance and light. The necessity of attending to the principles of perspective in all pictorial drawing is apparent when we consider, for instance, that a circle, when seen obliquely, appears to be not a circle, but an ellipse, with its shortest diameter in line with the spectator, and its longest at right angles to this. A square, when looked at from a position opposite the centre of one of its sides, appears as a trapezoid, the sides which are perpendicular to the direction of vision appearing to be parallel, while the other two appear to converge to a point in front of the spectator, &c. For the same reason, two rows of parallel pillars of equal height, seen from a point between and equidistant from each row, appear not only to converge at the further end, but to become gradually smaller and smaller. An excellent idea of a perspective plan can be easily obtained by interposing a vertical transparent plane (as of glass—a window, for instance) between the observer and the objects of his vision, and supposing that the object he sees are not seen through the glass, but parted on it. A sketch made on a glass plane in this position by following with a pencil all the lines and shades of the objects seen through it, the eye being all the time kept quite steady, would form a picture in perfect perspective. In practice, however, it is found, unfortunately, that glass is not a suitable material for sketching on, and that the vertical position is not the most convenient; it is therefore preferable to make a careful study of the effects produced by change of position and distance on the appearance of objects in nature, and from the results of this to compile a body of rules, by the observance of which painters may be enabled to produce an effect true to nature. After the 'scope' (i. e., the number of objects to be introduced, and the distance at which they are to be viewed) of the picture has been determined, and before the design is commenced, it is necessary to draw upon the perspective plan three lines: 1. The *base line*, or *ground line*, which limits the sketch towards the operator, and is the base line of the picture. 2. The *horizontal line*, which represents the ordinary position of the sensible horizon. The height of the horizontal line is about one-third of the height of the picture, when the sketcher is placed at or little above the level of the horizon; but it may rise in a degree corresponding to his increase of elevation till it reaches near to the top of the perspective plan. The general rule is to have a high horizontal line when the view is taken, or supposed to be

taken, from an eminence; but when the station is on a level, either actual or assumed, as is the case when a statue or a mountainous landscape is figured, the horizontal line must be low. The horizontal line in nearly all cases is supposed to be level with the spectator's eye. 3. The *vertical line*, which is drawn from the supposed position of the sketcher, perpendicular to the ground and horizontal lines, meeting the latter in a point which is called the *point of sight*, or centre of the picture. The vertical line has no representative in nature, and is merely a mechanical adjunct to the construction of the picture, all vertical lines in nature being parallel to it in the picture. The point of sight being the point directly opposite to the observer, is properly placed in the centre of the picture, for it is most natural that the view should lie symmetrically on each side of the principal visual line; but this is not by any means a universal rule, for we very frequently find it on the right or left side, but always, of course, on the horizontal line. All lines which in nature are perpendicular to the ground line, or to a vertical plane which is raised upon it as a base, meet in the point of sight, which is thus their *vanishing point* (see the line of the tops and bottoms of the pillars in fig. 1). The *points of distance* are two points in the

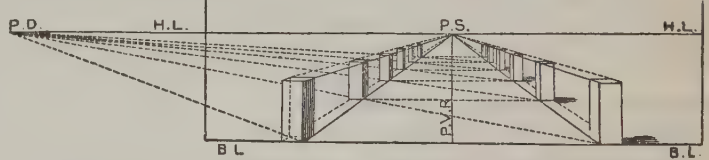

Fig. 1.

Illustrating the more important points and lines; P.V.B. is the principal visual ray.

horizontal line on each side of the point of sight, and in a 'direct' sketch are at a distance from it equal to the horizontal distance of the sketcher's eye from the ground line. The equality of distance of these points from the point of sight is not, however, necessary, as it occurs only in those cases where the lines, of which the points of distance are the *vanishing points*, are inclined (in nature) at an angle of 45° to the base line; but, in all cases, the two points of distance are about twice as far apart as the eye is from the picture. One important use of the points of distance is to define the distance of objects in a row (fig. 1) from each other. For this purpose, two points of distance are not necessary, as, when the position of one pillar is found, that of the one opposite is at once obtained by drawing a line parallel to the base or ground line. We have seen that the point of sight is the vanishing point of all level lines which meet the ground line or a vertical plane on it at right angles, and that the points of distance (in a *direct* picture) are the vanishing points of all lines which cut the ground line at an angle of 45° ; but there are many other groups of parallel lines in a picture which have different situations, and therefore different vanishing points. Such lines with their vanishing points (called, for distinction's sake, *accidental points*) are represented in fig. 2. If the accidental point is above the horizontal line, it is called the *accidental point aërial*—if below, the *accidental point terrestrial*; and a little consideration makes it evident that these points may or may not be situated within the plane of the picture. Such are the points and lines necessary for the construction of a plan in true perspective; and from the above explanation, we may deduce the two general principles: 1. That all parallel straight lines in nature are no longer parallel when projected on the

perspective plane, but meet in a point which is called the vanishing point, and is some one of the three above described, unless these lines happen to be also parallel to the ground line or the vertical line, in which case they remain parallel when transferred

PERTH, a city, royal, municipal, and parliamentary burgh, and capital of the county of the same name, is situated on the right bank of the Tay, 45 miles north-north-west of Edinburgh by railway (through Fife). The charming scenery of the

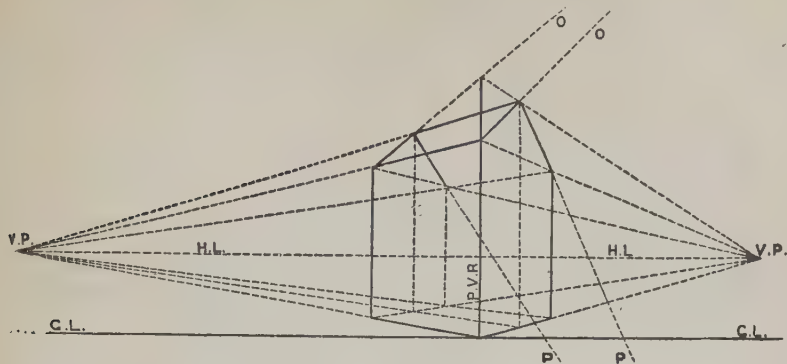

Fig. 2.

The lines O O converge to the accidental point aerial, and P P to the accidental point terrestrial.

to the picture; and 2. That since the bodies drawn below the horizontal line are seen as if from above, those above as if from below, and those to the right and left of the point of sight as if observed from the left and right, it follows, that straight lines which in the picture are above the horizontal line lower themselves, those below raise themselves to it; those to the left, following the same law, direct themselves to the right, and *vice versa*.

Aërial perspective, consists in a modulation of the brightness and colours of objects in accordance with the state of the atmosphere, the depth of the body in the perspective plane (i. e., distance in nature from the ground line), and other accidents of place and time. As the distance of objects increases, their illuminated parts are made less brilliant, and their shaded parts more feeble. The bluish tint imparted by a large mass of the atmosphere to the bodies seen through it, is frequently imitated by the mixing of a slight tint of blue with the colours to be applied; a yellow object thus assumes a greenish tint; a red one, a violet tint, &c. The air, when charged with vapour, is represented by a diminution of the brightness of colours, and by the grayish tint imparted to them. But in this part of the subject, rules are of little avail, for experience alone can guide the painter in faithfully copying the myriad aspects presented by nature.

A thorough knowledge of perspective is a *sine quâ non* to the painter or designer, and though many are inclined to think it a superfluity, and that the sketcher has only to make use of his eyes, and copy justly, the very fact that such is their opinion, shews that they have never made the attempt; for it is impossible for the painter, and much more so for the designer, to execute a copy of nature with sufficient accuracy by the sole aid of the eye and hand, a fact that is unfortunately much too frequently proved by many of the sketches exhibited in fine-art collections. Perspective was known to the ancients, but seems to have become extinct during the disturbances that convulsed Italy, and was revived by Albert Dürer, Pietro del Borgo, and Bramantino of Milan (1440), whose body of rules was extended and completed by Peruzzi and Ubbaldi about 1600. Dr Brook Taylor was the first Englishman who discussed the subject scientifically. Works on perspective are now abundant in every language.

PERSPIRATION. See SWEAT.

country, and the picturesque associations with which history and fiction have invested it, claim for it a high rank among the cities of Scotland. A handsome bridge of nine arches, 880 feet in length, and stretching over a water-way 590 feet in width, connects the town with the suburb of Bridgend, on the left bank of the river. Further down, the Perth and Dundee Railway crosses the river on a fine stone and iron bridge (opened in 1864), which also admits foot-passengers. The appearance of P. is much enhanced by two beautiful public parks, called the North and South Inches. The water-supply, obtained from the Tay, is filtered, raised by steam into two elevated reservoirs, and thence distributed over the town, rising to the upper stories of the highest houses. Among the most interesting public buildings are the church of St John, an ancient structure in the Pointed Style, surmounted by a massive square tower; the County Buildings, a Grecian edifice; the local prison, and the Penitentiary or General Prison, formerly used as a dépôt for French prisoners, and now one of the largest buildings of the kind in Scotland. The Penitentiary is the General Prison for Scotland, and all criminals sentenced to imprisonment for long periods are confined here. The town also contains a statue of the late Prince Consort, erected in 1864; Marshall's Monument, erected in honour of a former lord provost, and containing a public library and the Museum of the Antiquarian and Natural History Society; Sharp's, and other educational institutions. The river is navigable to P. for vessels of considerable burden. Wincey and striped shirting are manufactured; gloves, which at one time were a staple manufacture, are no longer made. There are dye-works, iron-foundries, breweries, &c.; and ship-building is also carried on. The salmon-fishery on the Tay is very valuable (250 tons of fish being exported annually to London alone). In 1872, 266 vessels, of 19,513 tons, entered and cleared the port. Five fairs are held annually, and horse-races take place every year on the North Inch. P. has a charter as a royal burgh from King William the Lion (1165—1214). It returns a member to the House of Commons. Pop. (1871) of royal and parliamentary burgh, 26,356; in 1881, 28,780.

PERTH, THE FIVE ARTICLES OF, memorable in the ecclesiastical history of Scotland, were five articles agreed upon in a meeting of the General Assembly of the Church of Scotland, convened at

Perth, by command of James VI., on 25th August 1618. These Articles enjoined kneeling at the Lord's Supper, the observance of Christmas, Good Friday, Easter, and Pentecost, and confirmation, and sanctioned the private administration of baptism and of the Lord's Supper. They were highly obnoxious to the Presbyterians of Scotland, not only on their own account, but as part of an attempt to change the whole constitution of the church; and because they were adopted without free discussion in the Assembly, and in mere compliance with the will of the king, who was also regarded as having unduly interfered with the constitution of the Assembly itself. They were, however, ratified by the parliament on 4th August 1621—a day long remembered in Scotland as *Black Saturday*—were enforced by the Court of High Commission, and became one of the chief subjects of that contention between the king and the people, which produced results so grave and sad for both, in the subsequent reign. The General Assembly of Glasgow, in 1638, declared that of Perth to have been 'unfree, unlawful, and null,' and condemned the Five Articles.

PERTHES, FRIEDRICH CHRISTOPH, an eminent German publisher, distinguished not only in his professional capacity, but for his sincere piety and ardent patriotism, was born at Rudolstadt, 21st April 1772. In his 15th year, he was apprenticed to a Leipzig bookseller, with whom he remained six years, devoting much of his leisure time to the acquisition of knowledge. In 1793, he passed into the establishment of Hoffmann, the Hamburg bookseller; and in 1796, started business on his own account; and, by his keen and wide appreciation of the public wants, his untiring diligence, and his honourable reputation, he ultimately made it the most extensive of the kind in modern Germany. During the first few years or so of his Hamburg apprenticeship, his more intimate friends had been either Kantian or sceptical in their opinions, and P., who was not distinguished for either learning or speculative talent, had learned to think with his friends; but a friendship which he subsequently formed with Jacobi (q.v.), and the Holstein poet and humorist, Matthias Claudius, led him into a serious but liberal Christianity. The iron rule of the French in Northern Germany, and the prohibition of intercourse with England, nearly ruined trade, yet P., even in this great crisis of affairs, found ways and means to extend his. He endeavoured to enlist the intellect of Germany on the side of patriotism, and in 1810 started the *National Museum*, with contributions from Jean Paul Richter, Count Stolberg, Claudius, Fouqué, Heeren, Sartorius, Schlegel, Görres, Arndt, and other eminent men. Its success was far beyond P.'s expectations, and encouraged him to continue his patriotic activity, till Hamburg was formally incorporated with the French empire. He subsequently took a prominent part in forcing the French garrison to evacuate Hamburg, 12th March 1813; and on its re-occupation by the French, he was one of the ten Hamburgers who were specially excepted from pardon. After peace had been restored to Europe, P. steadily devoted himself to the extension of his business, and to the consolidation of the sentiment of German national unity, as far as that could be accomplished by literature and speech. In 1822, he removed to Gotha, transferring his Hamburg business to his partner Besser. Here he laid himself out mainly for the publication of great historical and theological works. His subsequent correspondence with literary, political, and theological notabilities—such as Niebuhr (one of his dearest friends), Neander, Schleiermacher, Lücke, Nitzsch, Tholuck, Schelling, and Umbreit—

is extremely interesting, and throws a rich light upon the recent inner life of Germany. He died 18th May 1843.—See *Friedrich Perthes' Leben* (12th edit. 1853), written by his second son, Clemens Theodor Perthes, Professor of Law at Bonn.—The uncle of Friedrich Christoph P. was JOHANN GEOR. JUSTUS PERTHES, who established a publishing and bookselling house at Gotha in 1785, which has acquired, in the hands of his sons, a great reputation, and from which issues the famous *Almanach de Gotha*. He died in 1816.

PERTHSHIRE, one of the most important counties in Scotland, is bounded on the S. by the shires of Stirling and Clackmannan; on the N. by Inverness and Aberdeen; on the W. by Argyre and Dumbarton; and on the E. by Forfar, Fife, and Kinross. It extends from east to west about 70 miles, and from north to south about 66 miles. Its area is 2834 miles, or 1,814,063 acres, of which above 32,000 are covered with water. It is divided into the Highland and Lowland districts, the former occupying much the larger surface, and these are subdivided into 10 divisions—viz., Menteith, Strathearn, Gowrie, Stormont, Strathardle, Glenshee, Athole, Breadalbane, Rannoch, and Balquidder. P., from its insular position and other advantages, has a comparatively mild climate; and the soil, in Strathearn, Carse of Gowrie, and other less extensive tracts, being mostly composed of a rich loam, crops of all kinds are brought to the utmost perfection. These districts are also famed for their fruit and floral productions. P. is not less distinguished for its magnificent mountain, lake, and river scenery. The Grampians here attain to nearly their maximum height, Ben Lawers being within a few feet of 4000 in altitude; while Ben More is 3818; and several others above 3000. The lakes are numerous, the principal of which are Lochs Tay, Erich, Rannoch, Tummel, Lydock, Garry, Lyon, and Dochart. There are several streams of note, the principal being the Tay, which is fed by numerous other streams, and is said to discharge as much water into the sea as any other river in the kingdom. These lakes and streams afford excellent fishing, and the Tay is valuable for its salmon, yielding in rent about £12,000 a year.

According to the last agricultural statistics, taken in 1872, the entire number of acres under all kinds of crops, bare fallow and grass, was 327,696; under corn crops, 108,593; under green crops, 51,873; clover, sainfoin, and grasses under rotation, 89,750; permanent pasture and meadow land (exclusive of heath or mountain land), 74,140. The total number of horses used for agriculture, etc., was reported the same year to be 13,009; of cattle, 81,702; of sheep, 673,778; and of pigs, 11,620. The valued rent of P. for 1674 was equal to £28,330; the value for 1872—1873 was £817,492, exclusive of £134,483 for railways and water-works. The rate of assessments, general and special, is £1 1s. 9d. per £100.

The monuments of hoar antiquity to be found in this county afford an interesting field of investigation for the curious. Lying northward of the Roman wall, Perthshire comprises the scenes of the last struggle for independence which the inhabitants of the lowland districts of Scotland made against those formidable enemies of theirs, who were regarded as invincible. The last battle fought by the Caledonians against the Romans was at Mons Gramp, or, as it should be read, Gramp, supposed to be indicated by the great camp at Ardoch, between Dunblane and Crieff, and which does not at all seem to be connected with the Grampian Range. In this final struggle, the result of which was that the Lowlanders were defeated, Agricola commanded the conquering host, and the Caledonians were led by a chief named Galgacus.

The rate of assessments on the land for 1873—1874 amounted to 21s. 9d. per £100.

The Old Red Sandstone, granite, and slate abound. In this county are situated some of the stateliest mansions in Scotland, but, except Scone Palace, none of them contain any historical memorials; and the objects of interest to the antiquarian are confined to the Cathedrals of Dunblane and Dunkeld, the Abbey of Culross, and a few Druidical and Roman remains. There are two royal burghs, Perth and Culross, besides which there are several villages of considerable size, where trade in flax, &c. is carried on to some extent. The population in 1861 was 133,500; inhabited houses, 22,035; parliamentary constituency in 1863, was 3541. Pop. (1881) 129,007.

PERTINAX, HELVIUS, Roman emperor, was born, according to Dio Cassius, at Alba-Pompeia, a Roman colony of Liguria, August 1, 126 A. D. He received a good education, and, entering the military service, rose through the various grades till he obtained the command of the first legion, at the head of which he signalised himself in Rætia and Noricum against the native tribes. In 179, he was chosen consul, aided to repress the revolt of Avitus in Syria, and was governor successively of the provinces of Mœsia, Dacia, and Syria. Being sent by the Emperor Commodus to take the command of the turbulent legions in Britain, these troops, against his will, proclaimed him emperor; on which he solicited to be recalled, and was appointed proconsul of Africa, prefect of Rome, and consul (a second time) in 192. On the death of Commodus, his assassins almost forced P. to accept of the purple, which with great hesitation he did; but, in spite of his promise of a large donation, he was unable to gain over the prætorian guard. His accession was, however, hailed with delight by the senate and people, who were rejoiced to have, as ruler, an able captain, instead of a ferocious debauchee; and P., encouraged by this favourable reception, announced his intention of carrying out an extensive series of reforms, having reference chiefly to the army, in which he hoped to re-establish the ancient Roman discipline. Unfortunately for his reforms and himself, he was attacked by a band of the rebellious prætorians, two months and twenty-seven days after his accession; and disdaining to flee, was slain, and his head carried about the streets of Rome in triumph. From his history, nothing can be gathered respecting his character and talents (except in military affairs); but the respect and esteem in which he was held by the senate and people of Rome, argue well in favour of his disposition.

PERTURBATIONS, in Physical Astronomy, are the disturbances produced in the simple elliptic motion of one heavenly body about another, by the action of a third body, or by the non-sphericity of the principal body. Thus, for instance, were there no bodies in space except the earth and moon, the moon would describe accurately an ellipse about the earth's centre as focus, and its radius-vector would pass over equal areas in equal times; but only if both bodies be homogeneous and truly spherical, or have their constituent matter otherwise so arranged that they may attract each other as if each were collected at some definite point of its mass. The oblateness of the earth's figure, therefore, produces perturbations in what would otherwise be the fixed elliptic orbit of the moon. Again, when we consider the sun's action, it is obvious that in no position of the moon can the sun act equally upon both earth and moon; for at new moon, the moon is nearer to the sun than the earth is, and is therefore more attracted (in proportion to its mass) than the earth

—that is, the *difference* of the sun's actions on the earth and moon is equivalent to a force tending to draw the moon away from the earth. At full moon, on the other hand, the earth (in proportion to its mass) is more attracted than the moon is by the sun; and the perturbing influence of the sun is again of the nature of a force tending to separate the earth and moon. About the quarters, on the other hand, the sun's attraction (mass for mass) is nearly the same in amount on the earth and moon, but the *direction* of its action is not the same on the two bodies, and it is easy to see that in this case the perturbing force tends to bring the earth and moon nearer to each other. For any given position of the moon, with reference to the earth and sun, the *difference* of the accelerating effects of the sun on the earth and moon is a disturbing force; and it is to this that the perturbations of the moon's orbit, which are the most important, and amongst the most considerable, in the solar system, are due. [By the word *difference*, just employed, we are of course to understand, not the arithmetical difference, but the resultant of the sun's direct acceleration of the moon, combined with that on the earth reversed in direction and magnitude; as it is only with the *relative* motions of the earth and moon that we are concerned.] This disturbing force may be resolved into three components; for instance, we may have one in the line joining the earth and moon, another parallel to the plane of the ecliptic, and perpendicular to the moon's radius-vector, and a third perpendicular to the plane of the ecliptic. The first component, as we have already seen, tends to separate the earth and moon at new and full, and to bring them closer at the quarters; but during a whole revolution of the moon, the latter tendency is more than neutralised by the former; that is, in consequence of the sun's disturbing force, the moon is virtually less attracted by the earth than it would have been had the sun been absent. The second component mainly tends to accelerate the moon's motion in some parts of its orbit, and to retard it at others. The third component tends, on the whole, to draw the moon towards the plane of the ecliptic. We cannot, of course, enter here into even a complete sketch of the analysis of such a question as this; but we may give one or two very simple considerations which will, at all events, indicate the nature of the grand problem of perturbations.

The method, originally suggested by Newton, which is found on the whole to be the most satisfactory in these investigations, is what is called the *Variation of Parameters*, and admits of very simple explanation. The path which a disturbed body pursues is, of course, no longer an ellipse, nor is it in general either a plane curve or re-entrant. But it may be considered to be an ellipse which is undergoing slow modifications in form, position, and dimensions, by the agency of the disturbing forces. In fact, it is obvious that any small arc of the actual orbit is a portion of the elliptic orbit which the body would pursue for ever afterwards, if the disturbing forces were suddenly to cease as it moved in that arc. The *parameters*, then, are the elements of the orbit; that is, its major axis, eccentricity, longitude of apse, longitude of node, inclination to the ecliptic, and epoch; the latter quantity indicating the time at which the body passed through a particular point, as the apse, of its orbit. If these be given, the orbit is completely known, with the body's position in it at any given instant. If there be no disturbing forces, all these quantities are constant; and therefore, when the disturbing forces are taken into account, they change very slowly, as the disturbing forces are in most cases very small. To give an instance of the nature of their

changes, let us roughly consider one or two simple cases. First, to find the nature of some of the effects of a disturbing force acting in the radius-vector, and tending to draw the disturbed, from the central body. Let S be the focus, P the nearer apse, of the undisturbed elliptic orbit. When the moving body passes the point M , the tendency of the disturbing force is to make it describe the dotted curve in the figure—i. e., the new direction

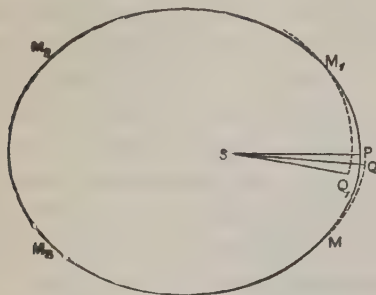

Fig. 1.

of motion will make with the line MS an angle more nearly equal to a right angle than before; and therefore the apse Q in the disturbed orbit will be sooner arrived at than P would have been in the undisturbed orbit—that is, the apse *regre-des*, or revolves in the contrary sense to that of M 's motion. Similarly, the effect at M_1 is also to make the apse regre to Q_1 . At M_2 and M_3 , on the other hand, the tendency is to make the apse progre. Also, as the velocity is scarcely altered by such a force, the major axis remains unaltered. Thus at M the eccentricity is diminished, and at M_1 increased, since the apsidal distance is increased at M , and diminished at M_1 .

Next, consider a tangential accelerating force. Here the immediate effect is to increase the velocity at any point of the orbit, and therefore to make it correspond to a larger orbit, and, consequently, a longer periodic time. Conversely, a retarding force, such as the resistance of a medium, diminishes the velocity at each point, and thus makes the motion correspond to that in an ellipse with a less major axis, and therefore with a diminished periodic time. This singular result, that the periodic time of a body is *diminished* by resistance, is realised in the case of Encke's comet, and this observed effect furnishes one of the most convincing proofs of the existence of a resisting medium in interplanetary space.

Again, the effect of a disturbing force continually directed towards the plane of the ecliptic, is to make the node regrede. Thus, if NN' represent

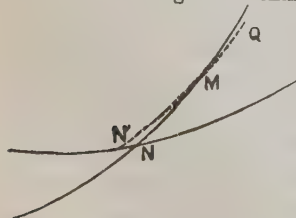

Fig. 2.

the ecliptic is diminished, when the planet has just passed the ascending node. In the second figure, let M_1 be a position of the planet near the descending node N_1 . The effect of the disturbing force is to alter the orbit to MN_1' . Thus, again,

the node regre-des, but the inclination is increased. If NN' and N_1N_1' in these figures represent the earth's equator, the above rough sketch applies exactly to the case of the moon as disturbed by the oblateness of the earth. The reaction of the moon on the earth

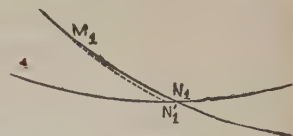

Fig. 3.

gives rise to the Precession of the Equinoxes (q. v.).

By processes of this nature, Newton subjected the variation of the elements of the moon's orbit to calculation, and obtained the complete explanation of some of the most important of the lunar inequalities. See MOON. Others of them—for instance, the rate of progression of the apse—cannot be deduced with any accuracy by these rough investigations, but tax, in some cases, the utmost resources of analysis. Newton's calculation of the rate of the moon's apse was only about half the observed value; and Clairaut was on the point of publishing a pamphlet, in which a new form was suggested for the law of gravitation, in order to account for the deficiency of this estimate; when he found, by carrying his analysis further, that the expression sought is obtainable in the form of a slowly converging series, of which the second term is nearly as large as the first. The error of the modern Lunar Tables, founded almost entirely on analysis, with the necessary introduction of a few data from observation, rarely amounts to a *second* of arc; and the moon's place is predicted four years beforehand, in the *Nautical Almanac*, with a degree of precision which no mere observer could attain even from one day to the next. This is the true proof, not only of the law of gravitation, but of the Laws of Motion (q. v.), upon which, of course, the analytical investigation is based.

With respect to the mutual perturbations of the planets, we may merely mention that they are divisible into two classes, called *periodic* and *secular*. The former depend upon the configurations of the system—such, for instance, is the diminution of the inclination of the moon's orbit, after passing the ascending node on the earth's equator, already mentioned, or its increase as the moon comes to the descending node. The secular perturbations depend upon the period in which a complete series of such alternations have been gone through, and have, in the case of the planets, complete cycles measured by hundreds of years.

A very curious kind of perturbation is seen in the *indirect* action of the planets on the moon. There is a secular change of the eccentricity of the earth's orbit, due to planetary action, and this brings the sun, on the average, nearer to the earth and moon for a long period of years, then for an equal period takes it further off. One of the effects of the sun's disturbing force being, as we have seen, to diminish, on the whole, the moon's gravity towards the earth, this diminution will vary in the same period as the eccentricity of the earth's orbit; and therefore the moon's mean motion will be alternately accelerated and retarded, each process occupying an immense period.

With special reference to the planetary motions, we may notice that the major axis of each planetary orbit is free from all secular variations; and those affecting the inclination and eccentricity are confined within small limits, and ultimately compensate themselves. These facts, which have been clearly and beautifully demonstrated by Laplace and Lagrange, assure the stability of the planetary orbits, if we neglect the effects of resistance due to

the interplanetary matter; which, however, must, in the long run, bring all the bodies of the system into collision with the sun, and finally stop the rotation of the sun itself.

Newton commenced the investigation of perturbations by considering those of the moon; Euler followed with a calculation of Saturn's inequalities; while Clairaut, D'Alembert, and others successively gave those of the other planets.

Every one knows that it was by observing the perturbations of Uranus, and thence discovering the direction of the disturbing force, that Adams and Leverrier were led to their great and simultaneous discovery of the planet Neptune.

PERU, an important maritime republic of South America, bounded on the N. by Ecuador, on the W. by the Pacific, on the S. by Chili, and on the E. by Bolivia and Brazil. It lies in lat. $3^{\circ} 25'$ — $19^{\circ} S.$, and in long. 67° — $81^{\circ} 20' W.$ The general outline resembles a triangle, the base of which is formed by the boundary-line between P. and Ecuador on the north. Its area is estimated at 500,000 square miles; and its population about 2,500,000. The area of P., however, can only be given approximately, as, on the east side of the Andes, and between the Amazon and the Purus, there is a wide and unexplored expanse of country, upon which both P. and Brazil have claims, which have not yet been determined. The country is 1100 miles in length, 780 miles in extreme breadth along the northern boundary, but is little more than 50 miles wide in the extreme south. Following the general direction, and not including windings, the coast-line is 1660 miles in length. The shores are in general rocky and steep; in the south, lofty cliffs rise from the sea, and, in some places, the water close inshore has a depth of from 70 to 80 fathoms. Further north, however, sandy beaches occur, and in the extreme north, the shores are often low and sandy, and covered with brushwood. Owing to the comparative unfrequency of bays and inlets along the coast, the harbours are few and unimportant. Those of Callao (the port of Lima) and Port Payta afford the most secure anchorage, and the others are the ports of Trujillo, Cañete, Pisco, Camaná, Islay, and Ilo. Landing by boats is always dangerous, on account of the dreadful surf, occasioned by the swell of the Pacific, which perpetually beats upon the coast; and when goods or passengers require to be landed on unsheltered shores, recourse is had to the primitive *balsas*, or rafts, worked by the natives, and capable of carrying two or three persons.

Islands.—The islands on the Peruvian coast, although valuable, are extremely few in number, and small in extent. In the north, are the Lobos (i.e., *Seal*) Islands, forming a group of three, and so called from the seals which frequent them. The largest of them, Lobos de Tierra, is 5 miles long by 2 miles broad, and the others, lying 30 miles south-west, are much smaller. On their eastern and more sheltered sides, they are covered with guano, and the quantity on the whole group is stated at 4,000,000 tons. The Chincha Islands, famous as the source from which Europe has been supplied with Peruvian guano (see **GUANO**) since 1841, also form a group of three, and are situated in the Bay of Pisco, about 12 miles from the mainland, and in lat. 13° — $14^{\circ} S.$, long. 76° — $77^{\circ} W.$ They lie in a line running north and south, and are called the North, Middle, and South Islands respectively. They closely resemble each other in size, formation, and general character. Each island presents, on the eastern side, a wall of precipitous rock, with rocky pinnacles in the centre, and with a general slope towards the western shore. The cavities and

inequalities of the surface are filled with guano, and this material covers the western slopes of the islands to within a few feet of the water's edge. There is no vegetation. The North Island has an area of 202 acres. It is formed of felspar and quartz, and is slowly but certainly decreasing in size. This island is wholly covered with thick layers of guano, which is quarried in some places to a depth of 80 feet. Numerous convicts have been employed in cutting the guano and loading the vessels. The Middle Island, on which there are 140 acres occupied by guano, has been worked to some extent, and in this case the labourers are Chinese. In 1861 the guano upon the islands was estimated at 9,538,735 tons. The exports in the two years 1869 and 1870 were estimated at 880,000 tons, valued at about \$40,500,000, and of this amount 320,000 tons were carried to Britain, and 50,000 to the United States.

The grand physical feature of the country, and the source of all its mineral wealth, is the great mountain system of the Andes. A general description of the formation and character of the Peruvian Andes is given under the article **ANDES** (q. v.).

Surface, Soil, and Climate.—The surface of P. is divided into three distinct and well-defined tracts or belts, the climates of which are of every variety from torrid heat to arctic cold, and the productions of which range from the stunted herbage of the high mountain-slopes, to the oranges and citrons, the sugar-canes and cottons, of the luxuriant tropical valleys. These three regions are the *Coast*, the *Sierra*, and the *Montaña*.—The *Coast* is a narrow strip of sandy desert between the base of the Western Cordillera and the sea, and extending along the whole length of the country. This tract, varying in breadth from 30 to 60 miles, slopes to the shore with an uneven surface, marked by arid ridges from the Cordillera, and with a rapid descent. It is for the most part a barren waste of sand, traversed, however, by numerous valleys of astonishing fertility, most of which are watered by streams, that have their sources high on the slopes of the Cordillera. Many of the streams are dry during the greater part of the year. Between these valleys extend deserts, which are sometimes 90 miles in width. These are perfectly trackless, being covered with a fine, shifting, yellow sand, which is often carried about by the wind in pillars of from 80 to 100 feet in height. In the coast-region, properly so called, rain is unknown. This is caused by the coast of P. being within the region of perpetual south-east trade-winds. These winds, charged with vapours from the Atlantic, strike upon the east coast of South America, and traverse that continent obliquely, distributing rains over Brazil. But their vapour is thoroughly condensed by the lofty Cordilleras, and their last particles of moisture are exhausted in powdering the summits of these ranges with snow, after which they fall down upon the coast of P., cool and dry. The want of rain, however, is compensated for to some extent by abundant and refreshing dews, which fall during the night. The climate of the coast is modified by the cool winds. In the valleys, the heat, though considerable, is not oppressive. The highest temperature observed at Lima in summer is 85° , the lowest in winter is $61^{\circ} F.$

The *Sierra* embraces all the mountainous region between the western base of the maritime Cordillera and the eastern base of the Andes, or the Eastern Cordillera. These ranges are, in this country, about 100 miles apart on an average, and have been estimated to cover an area of 200,000 square miles. Transverse branches connect the one range with the other, and high plateaux, fertile plains, and deep tropical valleys lie between the lofty outer barriers

The superiority in elevation alternates between the two principal ranges. The east range, or, as it is generally called, the Andes, has the superiority in height in the southern half of this mountain system. It abuts upon the plain, from the Bolivian frontier, in a majestic mass, surmounted by stupendous pinnacles, rugged in outline, and most frequently rising in splintered needle-like peaks, covered with snow. North of lat. 13° S., however, the Western Cordillera assumes the grander character, and preserves it until it crosses the northern frontier. The scenery of the Western Cordillera is broader and more massive in character, and its summits less pointed than those of the Andes. Rugged paths, sometimes so narrow as barely to afford footing to the mules which are invariably used in such ascents, lead up its steep sides. Occasionally, from these narrow passes, gaping and apparently bottomless precipices slide perpendicularly downward from the very feet of the traveller, and the prospect is rendered still more hideous by the distant roar of a torrent, hidden by mists, at the bottom of the ravine. Occasionally, also, the mountain route leads over abysses 500 feet in depth, across which, by way of bridge, a few poles are thrown, which roll about in an uncomfortable manner under the feet. In traversing these dangerous passes, which line the huge rocks like aerial threads, the traveller often comes upon scenery of the most picturesque and beautiful description. The clefts and sides of the hills, even at altitudes which might be called alpine, are clothed with wild-flowers, many of which, now long cultivated in Britain, have become highly prized among us as garden-plants. Verbenas, lupines, blue and scarlet salvias, fuchsias, calceolarias, and the fragrant heliotrope, add a sense of beauty to the sense of power which the stupendous scenery imparts. The following are the most striking and distinctive physical features of the Sierra, beginning from the south: 1. The plain of Titicaca, partly in P., and partly in Bolivia, is enclosed between the two main ridges of the Andes, and is said to have an area of 30,000 miles—greater than that of Ireland. In its centre is the great Lake Titicaca, 12,846 feet above sea-level, or 1600 feet above the loftiest mountain pass (the Col of Mont Cervin) of Europe. The lake is 115 miles long, from 30 to 60 miles broad, from 70 to 180 feet deep, and 400 miles in circumference. Its shape is irregular; it contains many islands, and several peninsulas abut upon its waters. 2. The Knot of Cuzco. The mountain-chains which girdle the plain of Titicaca trend toward the north-west, and form what is called the Knot of Cuzco. The Knot comprises six minor mountain-chains, and has an area thrice larger than that of Switzerland. Here the valleys enjoy an Indian climate, and are rich in tropical productions; to the north and east of the Knot extend luxuriant tropical forests, while the numberless mountain-slopes are covered with waving crops of wheat, barley, and other cereals, and with potatoes; and higher up, extend pasture-lands, where the vicuña and alpaca feed. 3. The valley of the Apurimac, 30 miles in average breadth, and extending north-west for about 300 miles. This valley is the most populous region of Peru. 4. The Knot of Pasco. From Cuzco proceed two chains toward the north-west; they unite again in the Knot of Pasco. This Knot contains the table-land of Bombon, 12,300 feet above sea-level; as well as other table-lands at a height of 14,000 feet, the highest in the Andes; otherwise, however, the physical features of the country resemble those of the vicinity of Cuzco. 5. The vale of the river Marañón. This valley, which is upwards of 300 miles in length, is narrow, deep, and nearer the equator than any

other valley of the Sierra, and consequently, it is the hottest portion of this region; and its vegetation is thoroughly tropical in character. The conformation of the surface of the Sierra is of the most wonderful description. After the table-lands of Tibet, those of the Peruvian Andes are the highest in the world; but, unlike those of Tibet, which are mere grassy uplands, the table-lands of P. are the seat of a comparatively high civilisation, and are studded over with towns and villages, perched on heights exceeding in elevation the summits of the Jungfrau and the Wetterhorn. Nor are such towns the mere eyries of miners who are tempted to ascend thus high in search of the precious metals; for, even at this elevation, the climate is pleasant, and wheat, maize, barley, rye, and potatoes thrive well. The city of Cuzco, situated in a region of rare beauty, and enjoying a temperate climate, is 11,380 feet above sea-level, or 2000 feet higher than the Great St Bernard. The climate of the Sierra, however, is not always so charming. In general terms, it may be described as mild and variable, with moderate rains. In the district of Paucartambo, rain falls 300 days in the year. A country, however, of such an uneven surface, of snow-covered peaks and tropical valleys, embraces every variety of climate. In all the lower regions of the country the climate is warm, but healthy; in the uplands, and on the highest plateaux, it is often inclement. Violent storms beat upon the plain of Titicaca; and terrific tempests, accompanied with thunder and lightning, roll frequently around the table-lands of Pasco (q. v.); where, indeed, the climate is so cold, that but for the mines, which have attracted hither a numerous population, this region might have remained uninhabited. At the height of 9000 feet above sea-level, the mean temperature is 60° Fahr., and the variation throughout the year is not great. The highest peaks of the country reach to upwards of 22,000 feet, and many peaks in both ranges are from 17,000 to 20,000 feet high. In the Western Cordillera, and in the south of the country, are four volcanoes—Candarave, Ubinas, Omate, and Arequipa. The soil of the Sierra is of great variety; but wherever it is cultivated, it is productive.

The *Montaña*, forming two-thirds of the entire area of the country, stretches away for hundreds of leagues eastward from the Andes to the confines of Brazil. On the N., it is bounded by the Amazon, on the S. by Bolivia. It consists of vast impenetrable forests and alluvial plains, is rich in all the productions of tropical latitudes, is of inexhaustible fertility, and teems with animal and vegetable life. It is still, however, almost wholly unproductive to man. The silence of its central forests has never been disturbed by the civilised explorer, and its only human inhabitants are a few scattered tribes of Indians. The *Montaña* is watered by numberless streams, and by a large number of important rivers. It belongs wholly to the basin of the Amazon. Along the head-waters of the Purus, which, flowing through beautiful forest-covered plains, approaches to within 60 miles of Cuzco, there were at one time numerous Spanish farms, where great tracts of forests had been cleared, and where crops of coco, cocoa, sugar, and other tropical productions, were regularly raised. These farms have since 1861 been abandoned, and the encroaching forest has already obliterated their sites. The upper waters of the Purus are the headquarters of a savage and barbarously cruel tribe of wild Indians called Chunchos. These untamable savages have shewn the greatest hostility to the advance of civilisation. They murdered the settlers, or drove them to take refuge in some less advanced settlement. When Mr Markham visited this region in 1853, a few farms

still existed; from a paper, however, which he communicates to the *Journal of the Royal Geographical Society*, and which is dated 1861, it would appear that the Chunchos have finished their barbarous work, for the settlers have either all been massacred or driven back from the forest, so that now not a single settlement remains. The rich valleys of Paucartambo, once covered with flourishing Spanish farms, have again become one vast tropical forest. The virgin soil of the Montaña is of amazing fertility; while its climate, though not oppressively hot, is healthy. The forests consist of huge trees, of which some are remarkable for the beauty of their wood, others for their valuable gums and resins, and others as timber trees. A rank undergrowth of vegetation covers the country, and the trees are often chained together and festooned with parasites and closely-matted creepers. In this region, for the most part undisturbed by the voice of man, civilised or savage, animal life flourishes in endless variety, and birds of the brightest plumage flit among the foliage. Among the products which are yielded here in spontaneous abundance, are the inestimable Peruvian bark (see CINCHONA), India-rubber, gum-copal, vanilla, indigo, copaiba, balsam, cinnamon, sarsaparilla, ipecacuanha, vegetable wax, &c. On the western fringe of the Montaña, where there are still a few settlements, tobacco, sugar, coffee, cotton, and chocolate, are cultivated with complete success.

Hydrography.—The hydrography of P. may be said to be divided into three systems—those of Lake Titicaca, the Pacific, and the Amazon. The streams that flow into Lake Titicaca are few and inconsiderable. The rivers which, having their sources in the Western Cordillera, flow west into the Pacific, are about 60 in number; but many of them are dry in summer, and even the more important are rapid and shallow, have a short course, are not navigable even for canoes, and are mainly used for the purpose of irrigation. All the great rivers of Peru are tributaries of the Amazon. The Marañon, rising between the Eastern and Western Cordilleras, and flowing tortuously to the north-north-west, is generally considered to be the head-water of the Amazon (q. v.). The Huallaga rises near the town of Huanuco, and flows northward to the Amazon. It is navigable for 600 miles, the head of its navigation (for canoes) being at Tingo Maria, within 100 miles of its source. The Yucayali, or Ucayali, an immense river, enters the Amazon 210 miles below the Huallaga. Its tributaries and upper-waters, among which are the Pampas and the Apurimac, drain the greater portion of the Peruvian Sierra. The Purus, which reaches to the valleys of Paucartambo, within 60 miles of Cuzco, has not yet been explored. We know several of its sources, and that it enters the Amazon by four mouths, a little above Barra. It flows through what is perhaps the richest and most beautiful region of Peru. Many attempts have been made to explore this river, none of which, however, down to 1862, appear to have met with any success. The facilities which it seems to afford for the transport of most valuable products, have long been acknowledged by the Peruvian government. One of the chief head-waters of the Purus is the Madre de Dios. In 1869 the government took an important step towards colonising the Amazon region, and opened the headlands of that river to foreign commerce. Its navigation has been declared free, and a railway projected to connect Lima with its head waters. The coast of P. is traversed by telegraphs, and one with Panama has been proposed. A progressive spirit has been awakened under the Presidency of Balta.

Productions, Exports and Imports, Revenue, &c.—

The wealth and resources of P. consist, not in manufactures, but entirely in mineral, vegetable, and animal products. As no statistics are taken in the country it is impossible to give the quantity and value of the productions, and of the exports and imports, even approximately. Of the precious metals, the production has greatly fallen off since P. became an independent state; and this country, which once stood in the same relation to Spain that Australia does to Great Britain, now contributes little to the metallic wealth of the world. The immense stores of gold and silver found here by the Spanish invaders represented the accumulation of centuries, and that among a people who used the precious metals only for the purposes of ornamentation. Nevertheless, P. possesses vast metallic riches. The Andes abound in mines of gold, silver, copper, lead, bismuth, &c.; and in the Montaña, gold is said to exist in abundance in veins and in pools on the margins of rivers. The export of specie, of which a portion consisted in coined money and plate, amounted in 1859, according to Mr Markham, to only £200,000. This comparatively insignificant amount of produce in a country so rich in the precious metals, is to be accounted for chiefly by the unscientific and improvident manner in which the mining operations are carried on. A grievance, from which this republic suffers much, is the want of good coinage. It can hardly be said that Peruvian coinage exists, inasmuch as that in circulation is from the mint of Bolivia. The British acting-consul at the Peruvian port of Islay, writing in 1863, says, however, that a new Peruvian coinage is in contemplation, and will no doubt be promptly introduced. But besides the precious metals, P. possesses other most important mineral resources. In addition to the guano to which allusion has already been made, another important article of national wealth is nitrate of soda, which is found in immense quantities in the province of Tarapaca. This substance, which is a powerful fertiliser (see NITRE), is calculated to cover, in this province alone, an area of 50 square leagues, and the quantity has been estimated at 63,000,000 tons. In 1868, 1,029,055 cwts., and in 1869, 891,151 cwts., were imported into G. Britain. Here also great quantities of borax are found. The working of this valuable substance, however, is interdicted by government, which has made a monopoly of it, as it has of the guano; but such small parcels of it as have been exported bring about £30 per ton in the English market.

The vegetable productions of P. are of every variety, embracing all the products both of temperate and tropical climes. The European cereals and vegetables are grown with perfect success, together with maize, rice, pumpkins, tobacco, coffee, sugar-cane, cotton, &c. Fruits of the most delicious flavour are grown in endless variety. Cotton, for which the soil and climate of P. are admirably adapted, is now produced here in gradually increasing quantity. The land suited to the cultivation of this plant is of immense extent, and the quality of the cotton grown is excellent. The animals comprise those of Europe, together with the Lama (q. v.) and its allied species. In 1869, 3,300,345 lbs. of lama and alpaca wool were imported into Great Britain. Although P. produces so much excellent wool, almost the whole of the woollen fabrics used as clothing by the Indians are manufactured in Yorkshire, England.

Ancient Civilisation and History.—P., the origin of whose name is unknown, is now passing through its third historical era, and is manifesting its third phase of civilisation. The present era may be said to date from the conquest of the country

by the Spaniards in the early part of the 16th c.: the middle era embraces the rule of the Incas; and the earliest era, about which exceedingly little is known, is that Pre-Incarial period, of unknown duration, during which a nation or nations living in large cities flourished in the country, and had a civilisation, a language, and a religion different, and perhaps in some cases even more advanced than those of the Incas who succeeded them, and overran their territories. Whence these Pre-Incarial nations came, and to what branch of the human family they belonged, still remain unanswered questions. Their existence, however, is clearly attested by the architectural remains, sculptures, carvings, &c., which they have left behind them. Ruins of edifices constructed both before the advent of the Incas, and contemporary with, and independently of, them, are found everywhere throughout the country. On the shores of Lake Titicaca, for example, are the ruins of Tia-Huanacu, consisting of sculptured monolithic doorways, one of which is 10 feet high, and 13 feet wide; of pillars, 21 feet high, placed in lines at regular distances; and of immense masses of hewn stone, some 33 feet long by 18 broad. In 1846, several colossal idols were excavated, some being 30 feet long, 18 wide, and 6 thick. The idols are in the form of statues, and the ears are not enlarged by the insertion in the lobes of silver rings, as those of sculptured figures, executed in Incarial times invariably are. The ancient fragments of buildings on these shores were beheld with astonishment by the earliest of the Incas, who, by their own confession, accepted them as models for their own architecture. The name Tia-Huanacu is comparatively modern, having been conferred by one of the Incas; neither history nor tradition has handed down the original name. The ruins stand at a height of 12,930 feet above sea-level, and one of the many mysteries which have crowded around this ancient site is, that this spot, in the midst of what is now generally a frozen desert, and where the rarity of the air must be so great as to be hurtful, should have been chosen as the seat, as it is generally believed to have been, of an ancient government. Of the character and degree of the civilisation of the Pre-Incarial races, almost nothing is known. It is worthy of note, however, that at Pachacamac, 25 miles south of Lima, where there are the remains of a now wholly deserted city, and of a great temple, the religion seems to have been a pure Theism; for when the Peruvians of Cuzco carried their victorious arms across the Cordilleras to this district, they beheld this temple (the doors of which are said to have been of gold inlaid with precious stones) with astonishment, not only because it rivalled if not surpassed in splendour the famous Temple of the Sun at Cuzco, but because it contained no image or visible symbol of a god. It was raised in honour of an invisible and mysterious deity, whom the inhabitants called Pachacamac, the Creator of the World (from two words of the ancient Peruvian language, *Pacha*, the earth; and *Camac*, participle of the verb *Camani*, to create). The Peruvians did not dare to destroy this temple, but contented themselves with building by its side a Temple of the Sun, to the worship of which they gradually won over the inhabitants.—For further information regarding Pre-Incarial times and races, see W. Bollaert's *Antiquities, Ethnology, &c. of South America* (Lond. 1860).

Regarding the origin of the Incas, nothing definite can be said. We have no authorities on the subject save the traditions of the Indians, and these, besides being outrageously fabulous in character, are also conflicting. It appears, however, from all the traditions, that Manco, the first Inca, first appeared

on the shores of Lake Titicaca, with his wife Mama Ocllo. He announced that he and his wife were children of the Sun, and were sent by the glorious Inti (the Sun) to instruct the simple tribes. He is said to have carried with him a golden wedge, or, as it is sometimes called, a wand. Wherever this wedge, on being struck upon the ground, should sink into the earth, and disappear for ever, there it was decreed Manco should build his capital. Marching northward, he came to the plain of Cuzco, where the wedge disappeared. Here he founded the city of Cuzco, became the first Inca (a name said to be derived from the Peruvian word for the Sun), and founded the Peruvian race, properly so called. Manco, or Manco Capac (i.e., Manco the Ruler), instructed the men in agriculture and the arts, gave them a comparatively pure religion, and a social and national organisation; while his wife, Mama Ocllo, who is also represented as being his sister, taught the women to sew, to spin, and to weave. Thus, the Inca was not only ruler of his people, but also the father and the high-priest. The territory held by Manco Capac was small, extending about 90 miles from east to west, and about 80 miles from north to south. After introducing laws among his people, and bringing them into regularly organised communities, 'he ascended to his father, the Sun.' The year generally assigned as that of his death, after a reign of forty years, is 1062 A.D. The progress of the Peruvians was at first so slow as to be almost imperceptible. Gradually, however, by their wise and temperate policy, they won over the neighbouring tribes, who readily appreciated the benefits of a powerful and fostering government. Little is clearly ascertained regarding the early history of the Peruvian kingdom, and the lists given of its early sovereigns are by no means to be trusted. They invented no alphabet, and therefore could keep no written record of their affairs, so that almost all we can know of their early history is derived from the traditions of the people, collected by the early Spaniards. Memoranda were indeed kept by the Peruvians, and, it is said, even full historical records, by means of the *quipu*, a twisted woollen cord, upon which other smaller cords of different colours were tied. Of these cross threads, the colour, the length, the number of knots upon them, and the distance of one from another, all had their significance; but after the invasion of the Spaniards, when the whole Peruvian system of government and civilisation underwent dislocation, the art of reading the quipus, seems either to have been lost, or was effectually concealed. Thus it is that we have no exact knowledge of Peruvian history further back than about one century before the coming of the Spaniards. In 1453, Tupac Inca Yupanqui, the eleventh Inca, according to the list given by Garcilasso de la Vega, greatly enlarged his already wide-spread dominions. He led his armies southward, crossed into Chili, marched over the terrible desert of Atacama, and penetrating as far south as the river Maule (lat. 36° S.), fixed there the southern boundary of Peru. Returning, he crossed the Chilean Andes by a pass of unequalled danger and difficulty, and at length regained his capital, which he entered in triumph. While thus engaged, his son, the young Huayna Capac, heir to the fame as well as the throne of his father, had marched northward to the Amazon, crossed that barrier, and conquered the kingdom of Quito. In 1475, Huayna Capac ascended the throne, and under him the empire of the Incas attained to its greatest extent, and the height of its glory. His sway extended from the equatorial valley of the Amazon to the temperate plains of Chili, and from the

sandy shores of the Pacific to the marshy sources of the Paraguay. Of this immense territory, Cuzco, as its name implies (the word signifies navel), was the great centre; great roads branched off from it to the north, south, east, and west, and ramified through every part of the kingdom. The greatest highway of the country was that which led from Quito through Cuzco into the Chilian dominions. In its construction, galleries were cut for leagues through the living rock; rivers were crossed by bridges of plaited osiers, that swung in the air; precipices were ascended by staircases artificially cut, and valleys were filled up with solid masonry. It was from 1500 to 2000 miles long, was about 20 feet broad, and was built of heavy flags of freestone. Upon all the great routes were posts or small buildings, about five miles apart, attached to which were a number of runners, whose business it was to carry forward the dispatches of government. By means of these messengers, fresh fish caught on one day at Lurin, on the Pacific, is said to have been eaten the next day at Cuzco. The distance between these places is 300 miles, and the road traverses the wildest and most mountainous country in the world. Order and civilisation accompanied conquest among the Peruvians, and each tribe that was vanquished found itself under a careful paternal government, which provided for it, and fostered it in every way.

The government of P. was a pure but a mild despotism. The Inca, as the representative of the Sun, was the head of the priesthood, and presided at the great religious festivals. He imposed taxes, made laws, and was the source of all dignity and power. He wore a peculiar head-dress, of which the tasselled fringe, with two feathers placed upright in it, were the proper insignia of royalty. Of the nobility, all those descended by the male line from the founder of the monarchy, shared, in common with the ruling monarch, the sacred name of Inca. They wore a peculiar dress, enjoyed special privileges, and lived at court; but none of them could enter the presence of the Inca except with bare feet, and bearing a burden on the shoulders, in token of allegiance and homage. They formed, however, the real strength of the empire, and, being superior to the other races in intellectual power, they were the fountain whence flowed that civilisation and social organisation which gave P. a position above every other state of South America. Prior to the arrival of the Spaniards, P. contained a population of 30,000,000—twelve times greater than it is at the present day. The empire was divided into four parts, into each of which one of the great roads branched from Cuzco. Each of the four provinces was administered by a viceroy or governor. The nation was further subdivided into departments of 10,000 inhabitants, each also administered by a governor; and there were other subdivisions into various numbers, the lowest of which was ten, and every one of which was ruled by head-men, who were responsible for offenders, and were required to see that those under them enjoyed the rights to which they were entitled. The governors and chief rulers were selected from the Inca aristocracy. The laws related almost wholly to criminal matters, and were few, and remarkably severe. Theft, adultery, murder, blasphemy against the Sun, and burning of bridges, were all capital crimes. The territory of the empire was divided into three portions, and from these portions were derived the revenue that supported the *Sun*, the *Inca*, and the *people* respectively. The numerous priesthood, and the costly ceremonial of the national worship, were supported by the first; the royal household and the government expenditure were defrayed out of the second; and

the people, at so much per head, divided the third of these portions. There was a new division of the soil every year, and the extent of land apportioned to each householder was regulated by the numbers in his family. It might be supposed that this arrangement would be fatal to improvement of the soil, and to the pride in and love of home; but this was not the case; and it is probable that at each partition of the soil, the tenant was, as a rule, confirmed in his occupation. The three divisions were cultivated by the people, the territory apportioned to the Sun being attended to first, that belonging to the people themselves next, and lastly, the division belonging to the Inca. The labour on the Inca's share of the land was engaged in by the whole population at the same time, and the work was lightened by the national songs and ballads, and the scene made picturesque by the holiday attire of the workers. The manufactures of the country were managed in the same way, the people labouring first in making clothes for themselves, and afterwards giving their work to the Inca. The mines were worked by the people, but no one gave more than a certain amount of time to the government service (during which time he was maintained at the government expense), and after discharging the stipulated amount of duty, he was succeeded by another. Money was unknown among the Peruvians. They were a nation of workers, but they wrought as the members of one family, labour being enforced on all for the benefit of all.

The national policy of the Peruvians had its imperfections and drawbacks, and though capable of unlimited extension, it was not capable of advancement. It was in the last degree conservative, and was of such a nature that the introduction of reform in any vital particular must have overturned the whole constitution. Nevertheless, the wants of the people were few, and these were satisfied. Their labour was not more than they could easily perform, and it was pleasantly diversified with frequent holidays and festivals. They lived contentedly and securely under a government strong enough to protect them; and a sufficiency of the necessaries of life was obtained by every individual. Still, in the valleys of the Cordilleras and on the plain of Cuzco, may be heard numberless songs, in which the Peruvian mourns the happy days of peace, security, and comfort enjoyed by his ancestors. Further, they revered and loved their monarch, and considered it a pleasure to serve him. With subjects of such a temper and inclination, the Incas might direct the entire energies of the nation as they chose; and it is thus that they were able to construct those gigantic public works which would have been wonderful even had they been performed with the assistance of European machinery and appliances.

The Peruvian system of agriculture was brought to its highest perfection only by the prodigious labour of several centuries. Not only was the fertile soil cultivated with the utmost care, but the sandy wastes of the coast, unvisited by any rains, and but scantily watered by brooks, were rendered productive by means of an artificial system of irrigation, the most stupendous, perhaps, that the world has ever seen. Water was collected in lakes among the mountains, led down the slopes and through the sands of the coast, apparently doomed to sterility, by canals and subterranean passages constructed on a vast scale, and the ruins of which, to be seen at the present day, attest the industry, ingenuity, and admirable patience of the Peruvians. The aqueducts, which were sometimes between 400 and 500 miles in length, were in some cases

tunnelled through massive rocks, and carried across rivers and marshes. They were constructed of large slabs of freestone, fitting so closely as to require no cement, and answering perfectly the purpose for which they were intended, for the sandy wastes were converted into productive fields and rich pasture-lands, and the coast teemed with industrious inhabitants. In the valley of Santa, there were once 700,000 inhabitants; there are now only 12,000: in that of Ancullama, there were 30,000 individuals; there are now only 425. The fields on the coast were also enriched with the manure of sea-fowls, which has since come to be known as guano. Fragments of the aqueducts still remain, and are surveyed with astonishment by the traveller, who wonders that such works could have been constructed by a people who appear to have employed no machinery, had no beasts of burden, who did not know the secret of the true arch, and who did not use tools or instruments of iron. But the triumphs of industry were not more decided on the coast than they were in the *Sierra*. Here, at elevations visited now only by the eagle and the condor, the rocky heights, riven by innumerable chasms and deeply-cut precipices, were crowned with waving crops of wheat and maize. Where the mountain-slopes were too steep to admit of cultivation, terraces were cut, soil was accumulated on them, and the level surfaces converted into a species of hanging-gardens. Large flocks of llamas were grazed on the plateaux; while the more hardy vicuñas and alpacas roamed the upper heights in freedom, to be driven together, however, at stated periods, to be shorn or killed. The wool yielded by these animals, and the cotton grown in the plains and valleys, were woven into fabrics equally remarkable for fineness of texture and brilliancy of colour.

The character of the architecture of the Peruvians has already been alluded to. The edifices of Incarial times are oblong in shape and cyclopean in construction. The materials used were granite, porphyry, and other varieties of stone; but in the more rainless regions, sun-dried bricks were also much used. The walls were most frequently built of stones of irregular size, but cut with such accuracy, and fitting into each other so closely at the sides, that neither knife nor needle can be inserted in the seams. Though the buildings were not, as a rule, more than from 12 to 14 feet high, they were characterised by simplicity, symmetry, and solidity. The Peruvian architects did not indulge much in external decoration; but the interior of all the great edifices was extremely rich in ornament. In the royal palaces and temples, the most ordinary utensils were of silver and gold; the walls were thickly studded with plates and bosses of the same metals; and exquisite imitations of human and other figures, and also of plants, fashioned with perfect accuracy in gold and silver, were always seen in the houses of the great. Hidden among the metallic foliage, or creeping among the roots, were many brilliantly-coloured birds, serpents, lizards, &c., made chiefly of precious stones; while in the gardens, interspersed among the natural plants and flowers, were imitations of them, in gold and silver, of such truth and beauty as to rival nature. The Temple of the Sun at Cuzco, called *Coricancha*, or 'Place of Gold,' was the most magnificent edifice in the empire. On the western wall, and opposite the eastern portal, was a splendid representation of the Sun, the god of the nation. It consisted of a human face in gold, with innumerable golden rays emanating from it in every direction; and when the early beams of the morning sun fell upon this brilliant golden disc, they were reflected from it as from a mirror, and again reflected throughout the whole temple by the numberless

plates, cornices, bands, and images of gold, until the temple seemed to glow with a sunshine more intense than that of nature.

The religion of the Peruvians, in the later ages of the empire, was far in advance of that of most barbarous nations. They believed in a Great Spirit, the Creator of the universe, who, being a spirit, could not be represented by any image or symbol, nor be made to dwell in a temple made with hands. They also believed in the existence of the soul hereafter, and in the resurrection of the body. The after-life, they considered to be a condition of ease and tranquillity for the good, and of continual wearisome labour, extending over ages, for the wicked. But while they believed in the Creator of the world, they also believed in other deities, who were of some subordinate rank to the Great Spirit. Of these secondary gods, the Sun was the chief. They revered the Sun as the source of their royal dynasty; and everywhere throughout the land, altars smoked with offerings burned in his worship.

About the year 1516, and ten years before the death of Huayna Capac, the first white man had landed on the western shores of South America; but it was not till the year 1532, that Pizarro (q. v.), at the head of a small band of Spanish adventurers, actually invaded Peru. On his death-bed, the great Inca expressed a wish that the kingdom of Quito should pass to Atahualpa, one of his sons by a princess of Quito whom he had received among his concubines, and that all his other territories should fall to his son Huascar, the heir to the crown, and who, according to the custom of the Incas, should have inherited all its dependencies. Between these two princes, quarrels, resulting in war, arose; and when Pizarro entered P., he found the country occupied by two rival factions, a circumstance of which he took full advantage. Atahualpa had completely defeated the forces of his brother, had taken Huascar prisoner, and was now stationed at Caxamalca, on the eastern side of the Andes, whither, with a force of 177 men, of whom 27 were cavalry, the dauntless Spanish leader, in September 1532, set out to meet him. For the capture of Atahualpa by the Spaniards, his subsequent life and violent death, see article ATAHUALPA. Shortly after the execution of the Inca at Caxamalca, the adventurers set out for Cuzco. Their strength had been recently increased by reinforcements, and they now numbered nearly 500 men, of whom about a third were cavalry. They entered the Peruvian capital, 15th November 1533, having in the course of their progress toward the city of the Incas, had many sharp, and sometimes serious encounters with the Indians, in all of which, however, their armour, artillery, and cavalry gave them the advantage. At Cuzco they obtained a vast amount of gold, the one object for which the conquest of P. was undertaken. As at Caxamalca, the articles of gold were for the most part melted down into ingots, and divided among the band. Their sudden wealth, however, did many of them little good, as it afforded them the means of gambling, and many of them, rich at night, found themselves again penniless adventurers in the morning. One cavalier having obtained the splendid golden image of the Sun as his share of the booty, lost it in play in a single night. After stripping the palaces and temples of their treasures, Pizarro placed Manco, a son of the great Huayna Capac, on the throne of the Incas. Leaving a garrison in the capital, he then marched west to the sea-coast, with the intention of building a town, from which he could the more easily repel invasion from without, and which should be the future capital of the kingdom.

Choosing the banks of the river Rimac, he founded, about six miles from its mouth, the *Ciudad de los Reyes*, 'City of the Kings.' Subsequently, its name was changed into Lima, the modified form of the name of the river on which it was placed. But the progress of a higher civilisation thus begun, was interrupted by an event which overturned the plans of the general, and entailed the severest sufferings on many of his followers. The Inca Manco, insulted on every hand, and in the most contemptuous manner, by the proud Castilian soldiers, effected his escape, and headed a formidable rising of the natives. Gathering round Cuzco in immense numbers, the natives laid siege to the city, and set it on fire. An Indian force also invested Xauxa, and another detachment threatened Lima. The siege of Cuzco was maintained for five months, after which time the Peruvians were commanded by their Inca to retire to their farms, and cultivate the soil, that the country might be saved from famine. The advantages, many, though unimportant, which the Inca gained in the course of this siege, were his last triumphs. He afterwards retired to the mountains, where he was massacred by a party of Spaniards. More formidable, however, to Pizarro than any rising of the natives, was the quarrel between himself and Almagro, a soldier of generous disposition, but of fiery temper, who, after Pizarro, held the highest rank among the conquerors. For the insurrection, trial, and execution of this chief, see article **ALMAGRO**. The condition of the country was now in every sense deplorable. The natives, astonished not more by the appearance of cavalry than by the flash, the sound, and the deadly execution of artillery, had succumbed to forces which they had no means of successfully encountering. Meantime, the Almagro faction had not died out with the death of its leader, and they still cherished schemes of vengeance against the Pizarros. It was resolved to assassinate the General as he returned from mass on Sunday, 26th June 1541. Hearing of the conspiracy, but attaching little importance to the information, Pizarro nevertheless deemed it prudent not to go to mass that day. His house was assaulted by the conspirators, who, murdering his servants, broke in upon the great leader, overwhelmed him by numbers, and killed him (see **PIZARRO**). The son of Almagro then proclaimed himself governor, but was soon defeated in battle, and put to death. In 1542, a council was called at Valladolid, at the instigation of the ecclesiastic Las Casas, who felt shocked and humiliated at the excesses committed on the natives. The result of this council was, that a code of laws was framed for P., according to one clause of which, the Indians who had been enslaved by the Spaniards were virtually declared free men. It was also enacted that the Indians were not to be forced to labour in unhealthy localities, and that in whatever cases they were desired to work in any particular locality, they were to be fairly paid. These and similar clauses enraged the adventurers. Blasco Nufiez Vela, sent from Spain to enforce the new laws, rendered himself unpopular, and was seized, and thrown into prison. He had come from Spain, accompanied by an 'audience' of four, who now undertook the government. Gonzalo Pizarro (the last in this country of the family of that name), who had been elected captain-general of P., now marched threateningly upon Lima. He was too powerful to withstand, and the audience received him in a friendly manner, and after the administration of oaths, elected him governor as well as captain-general of the country. The career of this adventurer was cut short by Pedro de la Gasca, who, invested with the powers

of the sovereign, arrived from Spain, collected a large army, and pursued Pizarro, who was eventually taken and executed.

A series of petty quarrels, and the tiresome story of the substitution of one ruling functionary for another, make up a great part of the subsequent history. The country became one of the four vice-royalties of Spanish America, and the Spanish authority was fully established and administered by successive viceroys. The province of Quito was separated from P. in 1718; and in 1788, considerable territories in the south were detached, and formed into the government of Buenos Ayres. At the outbreak of the War of Independence in South America, the Spanish government, besides having much declined in internal strength, was distracted by the dissensions of a regency, and torn by civil war; nevertheless, in 1820, the Spanish viceroy had an army of 23,000 men in Peru, and all the large towns were completely in the hands of Spanish officials. P. was the last of the Spanish South American possessions to set up the standard of independence. In August 1820, a rebel army, under General San Martin, one of the liberators of Chili, sailed for P., and after a number of successes both on sea and land, in which the patriots were most effectively assisted by English volunteers, the independence of the country was proclaimed 28th July 1821, and San Martin assumed the protectorate of the young republic. From this date to the year 1860, 21 rulers, under various titles, have held sway. For the first 24 years of its existence as an independent republic, the country was distracted and devastated by wars and revolutions. In 1845, Don Ramon Castilla was elected president; and under his firm and sagacious guidance, the country enjoyed an unwonted measure of peace, and became regularly organised. Commerce began to be developed, and important public works were undertaken. The term of his presidency ended in 1851, in which year General Rufino José Echenique was elected president. An insurrection followed, and Castillon became president in 1855. Slavery, which, although abolished by the charter of independence, still existed, was put an end to by a decree dated October, 1854.

On the 14th April, 1864, the Spaniards took possession of the Chincha Islands, and demanded indemnification for alleged outrages on some Basque emigrants. In January, 1865, terms of peace were offered by the Peruvian government and accepted, but, proving offensive to the people, an insurrection broke out, which resulted in the fall of President Perez and the establishment of a dictatorship under Prado, who also became President in 1867, an alliance with Chili and a renewal of the war with Spain. On February 7, 1866, the combined fleets of P. and Chili defeated the Spanish squadron off the island of Chiloe, and in May the enemy was repulsed in his attack on Callao. In 1869, by common consent, plenipotentiaries were appointed to meet at Washington, where, in April, 1871, the United States acting as a mediator, they concluded the terms of an indefinite truce or general armistice, which may be terminated by either party only after three years' previous notice to the other, conveyed through the government of the United States.

The present constitution, proclaimed Aug. 31, 1867, is modelled on that of the United States. In 1868, the Senate consisted of 36, and the House of Representatives of 86 members. The President and Vice-President are both elected by the people for a term of 5 years. The present President is Col. José Balta, elected in 1868. The Roman Catholic religion is declared the religion of the state, and the public exercise of other forms is prohibited.

The revenue is mainly derived from the sale of

guano (direct taxation does not exist), and for the two years, 1869 and 1870, was estimated at \$55,903,900, the sales of guano being about \$40,500,000. The expenses were estimated at \$77,185,209. The acknowledged foreign liabilities on October 1, 1870, were £20,389,200, most of which is a British railway loan.

The army, in 1872, consisted of 13,200 men; the navy, 6 monitors, and 6 other steamers. The armament of the iron-clad steam frigate *Independence*, built in London, consists of Armstrong guns. The two iron-clads, *Atahualpa* and *Manco Capac*, purchased of the United States in 1869, have revolving turrets, and throw 500-pound shot.

PERUGIA, a city of Central Italy, capital of the province of Umbria, stands on a lofty elevation, 800 feet high, on the right bank of the Tiber, ten miles east of the lake of the same name (ancient *Lacus Trasimenus*), and 84 miles north of Rome. It is surrounded with walls pierced with numerous gates, of which the *Arch of Augustus* (so called from the inscription *Augusta Perusia* over it, inscribed by Augustus) is the finest. It is the see of a bishop, and contains upwards of 100 churches, and about 50 monastic establishments. Its streets are wide, and there are several squares lined with massive buildings. The broad Corso, which contains the finest edifices, unites two squares, one of which is occupied by the Duomo, or cathedral, dedicated to San Lorenzo, and dating from the end of the 15th century. It is in a fine bold Gothic style, and contains many excellent paintings, carvings, &c. Many of the churches and convents are noble Gothic structures, and all of them are more or less famous for their pictures, some of which are by Raphael, Perugino, and other great masters. In the vicinity of the city, a number of tombs, supposed to mark the site of the necropolis of ancient P., were discovered in 1840. The tombs contain numerous beautiful cinerary urns, in marble and travertine; and lamps, vases, bronze armour, ornaments, patera, &c., were also found, but have for the most part been removed to a neighbouring villa. The university of P., founded in 1320, and liberally endowed, contains a botanic garden, a cabinet of mineralogy, a museum of antiquities, and a library of 30,000 vols., with some valuable manuscripts. It is attended by from 300 to 400 students. Besides the picture-gallery of the Academy of Fine Arts, there are numerous private art-collections. P. contains also many interesting palaces, a beautiful fountain, an exchange, theatres, &c. Velvets, silk-stuffs, woollen goods, soap, brandy, and liqueurs are manufactured; and a considerable trade is carried on in corn, oil, wool, wine, and cattle. Pop. (1872), inclusive of suburbs, 49,503; in 1879, 49,105.

P., the ancient *Perusia*, was one of the twelve Etrurian republics. It became tributary to Rome 294 B.C. During the war between Mark Antony and Augustus, it was taken by the latter, and was burned down. It was captured by the Goths under Totila at the fall of the Western Empire. Under Pope Paul III., it was united to the Papal States. In 1860, it became a part of the Kingdom of Italy under Victor Emmanuel.

PERUGIA, LAKE OF. See **TRASIMENUS LACUS**.

PERUGINO, a celebrated Italian painter, whose real name was **PIETRO VANNUCCI**, was born at Citta della Pieve in Umbria, about 1446, but having afterwards established himself in the neighbouring and more important city of Perugia, where he had the right of citizenship, he is commonly called *Il Perugino*. It is generally thought that he studied under Andrea Verocchio at Florence. He executed numerous excellent works in various cities, particularly in

Florence, Siena, Pavia, Naples, Bologna, Rome, and Perugia. Sixtus IV. employed him in the Cappella Sistina; and his fresco of 'Christ giving the Keys to Peter' is by far the best of those painted on the side-walls of that chapel. He also, along with other contemporary painters, decorated the Stanze of the Vatican; and his works there are the only frescoes that were spared when Raphael was commissioned to substitute his works for those formerly painted on the walls and ceilings. The fact of his having had Raphael for his pupil, has no doubt in one way increased the reputation of P., but it has also in some degree tended to lessen it, as, in many of P.'s best productions, the work of Raphael is confidently pointed out by connoisseurs, and, indeed, many important pictures, at one time acknowledged as his, are now ascribed to his great pupil. His high standing as a painter, however, is established by many admirable works, in which no hand superior to his own could have operated; and, with the exception, perhaps, of Francia, who in some respects is esteemed his equal, he is now acknowledged as the ablest of the masters of that section of the early Italian school in which religious feeling is expressed with great tenderness, in pictures remarkable for delicate execution. P.'s works are also distinguished by rich and warm colouring. An excellent example of this master's work may be studied in the collection of the National Gallery, London—No. 238. The Virgin Adoring the Infant Christ. P.'s reputation was high, when the introduction of the cinquecento style, by Leonardo and Michael Angelo, tended to throw into the shade the art of the earlier masters. Disputes ran high between the leaders of the old and new styles, and Michael Angelo is said to have spoken contemptuously of P.'s powers. This, of course, has biassed Vasari's opinion in his estimate of the opponent of his idol, but P.'s reputation now stands very high, and his works are greatly esteemed. Raphael was about twelve years of age when he was entered as a pupil with P., who was then (1495) engaged on the frescoes in the Sala del Cambio (the Exchange) at Perugia. P. died at Castello di Fontignano, near Perugia, in 1524.

PERUVIAN ARCHITECTURE. Although the buildings of Peru were erected probably about the 12th c. A.D., they possess an extraordinary likeness to those of the Pelasgi in Europe. This resemblance in style must be accidental, arising probably from the circumstance, that both nations used bronze tools, and were unacquainted with iron. The Peruvian walls are built with large polygonal blocks of stone, exactly like what we call 'Cyclopean masonry.' The jambs of the doorways slope inwards, like those of Etruscan tombs, and have similar lintels. The walls of Cuzco are good examples of this style. It is further remarkable, that these walls are built with re-entering angles, like the fortifications which were adopted in Europe only after the invention of gunpowder.

PERUVIAN BARK. See **CINCHONA**.—But whilst the article Cinchona was passing through the press, an important event was taking place in the introduction of cinchonas, or Peruvian Bark trees into British India. This had long been urged on the East India Company by Dr Royle, but was not undertaken till after his death. The same thing had been attempted a year or two before by the Dutch in Java, on the urgent representations of the botanist Blume, but with very imperfect success, owing to their having procured chiefly plants of a species which produces bark of very inferior quality and yields little quinine. But Mr Markham, who

was sent to South America by the East India Company to procure seeds and plants, was successful in introducing into British India, in the latter part of 1861, a number of the very best species, which were planted on the Neilgherry Hills, and also in Ceylon and the Himalayas. According to the report of C. B. Clarke, Superintendent of Cinchona Cultivation in India, the number of trees in permanent plantations at Darjeeling, in the Sikkin, on 31st March, 1870, amounted to 1,500,758, most of which were the *C. succirubra*, *Calisaya*, *micrantha*, and *officinalis*, the *Calisaya* being planted at the rate of 4000 per acre. The cultivation of cinchona in Java was proceeding satisfactorily, 870,000 having been transplanted; the produce of 1870 was estimated at about 8000 pounds of dry bark for exportation, and the preparation already forms an important industry. Some of the Java cinchonas, however, contain but 1.1 to 3.5 per cent. of alkaloids, and are not at present adapted to the production of quinine. Some of the Neilgherry cinchonas, such as the *C. mirabilis*, contain 13½ per cent. of quinine alkaloids. Cinchonas have recently been planted in St Helena, and it is proposed to attempt plantations in Jamaica. (See Markham's *Travels in Peru and India*, London, 1862, and *Edinburgh Review*, October, 1863.)

PERUVIAN GOOSEBERRY. See PHYSALIS.

PESA'RO (the ancient *Pisanurum*), a town of Central Italy; capital of the province of the same name, on a rocky wooded hill, on the right bank of the Foglia, and one mile from the mouth of that river in the Adriatic—20 miles north-east of Urbino. Its streets are broad, and it is surrounded by walls and defended by a citadel. It is a bishop's seat, and contains a cathedral and other churches. The country in the vicinity is fruitful and beautiful; the figs of the district being esteemed the best in Italy. The port cannot now accommodate vessels of more than 70 tons burden; but is large enough to contain 200 vessels of light draught. Silks, pottery, glass, and leather are manufactured; and an active trade in silk, hemp, and woollen goods is carried on. Pop. 10,740.

PESCHIERA, a frontier town and fortress of the kingdom of Italy, and a member of the famous Quadrilateral (q. v.), stands partly on an island in the channel of the Mincio, and partly on the right bank of that river, at its outlet from the Lake of Garda. The town itself is a poor place of less than 2000 inhabitants. P. commands the right bank of the river, and in connection with it is the extensive work called the 'Salvi,' which covers the approaches of the river in that direction. During the French republican war, P. was a simple pentagon. Its fortifications, however, have been greatly strengthened by the Austrians. It is defended by walls and by forts, lunettes, fosses, and a covered-way; and the purpose which it is mainly intended to serve, besides that of forming an entrenched camp capable of accommodating a considerable number of troops, is to harass an army attempting to cross the Mincio by Goito or Valeggio. In the island portion of the town are extensive barracks, forming three sides of a square. P. is a station on the Milan and Venice Railway, and is also a station of the steamers that ply on the Lake of Garda. P. was taken by the Piedmontese under King Charles Albert in 1848, and was again invested by them in June, 1859, after the battle of Solferino. The conclusion of the treaty of Villafranca, however (July 11, 1859), relieved P. from a siege, and it was included in the kingdom of Italy by treaty of Vienna, 1866.

PESHAW'ER, or PESHAWUR, an important town, on the north-west frontier of India, capital of a province of the same name, 18 miles east of the

eastern extremity of Khyber Pass, and 150 miles east-south-east of Cabul. It is defended by a bastioned wall, and commanded by a fort, the fear of which prevents internal disturbances. At the commencement of the present century, P. had 100,000 inhabitants. Under the stern rule of the Sikhs, however, its trade languished, and its splendid mosques, many of them in the richest style of oriental architecture, fell into decay. It is on the route from Hindustan to Cabul and Khorassan by the Khyber Pass, and is the seat of a British garrison, maintained here for the purpose of preserving the security of the route. Under British protection, the town is reviving, trade is becoming more active, and the appearance of the suburbs and environs is improved. Pop. 58,555. The province of P., included in the Punjab, and formerly forming a portion of Afghanistan, is about 2300 square miles in extent, and has 532,152 inhabitants. It is exceedingly fruitful. The division of P., which includes the province of P. and two others, has an area of 7767 square miles and a population of 1,035,785.

PESHIT'O, or rather PESHIT'TO (Syr., not, as generally supposed, 'simple,' 'faithful,' scil. Version, but the 'explained,' i. e., translated, Bible), is the name given to the authorised Syriac Version of the Old, and the greatest part of the New Testament. This version holds among the Syrian Christians the same place as the Vulgate in the Roman, and the 'Authorised Version' in the English Church. Many are the traditions about its origin. Thus, the translation of the Old Testament is supposed to date from the time of Solomon and Hiram; or to have been done by Asa, the priest; or, again, that it belongs to the time of the Apostle Thaddæus (Adæus), and Abgar, the king of Osroene, in the 1st c. after Christ. To the same period is also supposed to belong the translation of the New Testament, which is ascribed to Achæus, a disciple of Thaddæus, the first Edessian bishop and martyr. Recent investigation has not as yet come to any nearer result than to place the latter vaguely in the 2d, and the former in the 3d c., and to make Judaic-Christians the authors of both. Ephræm Syrus (q. v.), who wrote in the 4th c., certainly speaks of the P. as *Our Version*, and finds it already necessary to explain some of its terms, which had become obsolete. Five books of the New Testament (the Apocalypse and four of the Epistles) are wanting in all the MSS., having probably not yet formed part of the canon when the translation was made. The version of the Old Testament was made direct from the Hebrew, and by men imbued with the Palestinian mode of explanation. It is extremely faithful, and astonishingly free from any of those paraphrastic tendencies which pervade more or less all the Targums or Aramaic versions. Its renderings are mostly very happy, and coincide in many places with those of the Septuagint, a circumstance which has given rise to the erroneous supposition, that the latter itself had been drawn upon. Its use for the Old Testament is more of an exegetical, for the New Testament, more of a critical, nature. Anything like an edition of the P. worthy of its name, is still as much a desideratum as is a critical edition of the Septuagint or the Targums, and consequently investigators have as yet been unable to come to anything but very hazy conclusions respecting some very important questions connected with it. The *editio princeps* of the New Testament part dates Vienna 1555; that of the Old Testament is contained in the Paris Polyglot of 1645. Several portions of the P. have been translated again into Arabic. The Syriac translation of those parts of the New Testament which are not to be found in the P., but are now

incorporated into our Syriac Bibles, and are of late and uncertain date.

PESTALOZZI, JOHANN-HEINRICH, was born at Zürich, 12th January 1745. His family belonged to the middle-class gentry. He was destined for the Christian ministry, but turned aside, however, from this profession, and betook himself to the study of law. To this pursuit he did not long remain constant. The perusal of Rousseau's *Emile*, and the unsatisfactory political condition in which he found Europe, united to disgust him with the artificial life of cities, and he accordingly removed to the country, to devote his life to farming. Purchasing some waste land (after he had acquired the necessary experience), he applied himself successfully to its cultivation, marrying about the same time the daughter of a wealthy merchant. His mind continuing to be afflicted by the contemplation of the unhappy condition of the masses of the people, he devoted himself, during the intervals of his work, to the consideration of the means best suited to promote their elevation. He was convinced that, by means of a sound education, a remedy might be found for the many evils by which he was surrounded, and by which society was infected. To give effect to his theories, he converted his own house into an orphan asylum, and endeavoured, by a judicious blending of industrial, intellectual, and moral training, to afford a specimen of sound education, and one so contrived as to be practicable as a national scheme. Meanwhile, the pursuit of his benevolent enterprises involved him, after the lapse of fifteen years (1775–1790), in bankruptcy. The failure of his plans, and the democratic tendency of his opinions, brought upon him a good deal of contempt and opposition. His only consolation was having saved from degradation and neglect upwards of 100 children, and having issued several volumes on education, containing the results of his experience, and his hopes for the future of the masses. Many subsequent attempts to found schools and to give a specimen of rational scholastic training, were made by P., with varying educational success, but with invariable pecuniary embarrassment. His writings, meanwhile, increased in number and importance. The great idea which lay at the basis of his method of intellectual instruction was, that nothing should be treated of except in a concrete way. *Objects themselves* became in his hands the subject of lessons tending to the development of the observing and reasoning powers—not lessons about objects. In arithmetic, he began with the concrete, and proceeded to the abstract; and into the teaching of writing, he for the first time introduced graduation. His special attention, however, was directed to the moral and religious *training* of children, as distinct from their mere *instruction*; and here, too, graduation and a regard to the nature and susceptibilities of children, were conspicuous features of his system. Almost all P.'s methods are now substantially adopted by the instructors of elementary teachers in the Normal Schools of Europe, and to no man perhaps has primary instruction been so largely indebted. He died in 1827 at Brugg, in the canton of Basel, overwhelmed with mortifications and disappointments.

PESTH, the most populous and important commercial city of Hungary, on the left bank of the Danube, opposite Buda (q. v.), and 171 miles east-south east of Vienna by railway. It occupies a low and level site, and contrasts strongly with the antique, picturesque, and rock-built Buda, on the other side of the river. The two cities are connected by a magnificent suspension-bridge, erected in 1849, and

which spans a water-way of about 1500 feet. Communication is also facilitated by steam-ferries, which cross the river every hour. Along the P. side of the river runs a wide quay, paved and terraced, and backed by a handsome row of buildings, $1\frac{1}{2}$ miles long. The city consists of five divisions—the Inner, Leopold, Theresa, Joseph, and Francis towns. The Inner town, on the bank of the Danube, is the oldest, and the other divisions surround it in the form of a semicircle. P. is the seat of the chief judicial courts of Hungary. Its university, founded at Tynau, was transferred to Buda in 1780, and thence was removed hither in 1784. It is attended by upwards of 1000 students, who are taught by 50 professors, and is richly endowed. Attached to it are a museum, a botanic garden, an observatory, and a library of 75,000 volumes. Of the chief buildings and institutions, the principal are the synagogue, a large and beautiful structure, completed in 1857; the New Buildings (*Neugebäude*)—an immense edifice, now used as barracks and as an artillery dépôt; the gymnasium; military school; academy of arts; national museum, with a library of 120,000 volumes, and valuable collections of coins, medals, and antiquities; veterinary school; the national and other theatres; and the Hungarian scientific society. The town contains several important silk-spinning factories, and the principal articles of manufacture are silk, cotton, leather, jewellery, and musical instruments. The distilling of brandy, and the grinding of grain into meal and flour, are among the most important branches of industry. There are 168 flour-mills driven by water, 8 driven by wind, and 4 by steam. Four great fairs take place here annually, which draw together a concourse of more than 30,000 strangers, and at which exchanges, amounting in value to upwards of 32,000,000 florins, are made. In the course of the year, about 8000 barges unload at the quay, and the trade is chiefly in wines, raw hides, honey, wax, and an inferior spirit made from plums. After Vienna, P. has the greatest trade of any city on the Danube. Pop. in 1869, 157,275, made up of the most various nationalities—Germans, Magyars, Slovaks, Greeks, and Turks—the majority of whom are Roman Catholics. Pop. of Buda-Pesth in 1880, 359,821.

P. is mentioned for the first time in the 12th c.; but although one of the oldest towns in Hungary, its importance dates only from the reigns of Maria Theresa and Joseph II. It was desolated by the Mongols in the 13th c.; and after the battle of Mohacs (q. v.), it fell into the hands of the Turks, who held it till 1686. At the beginning of the 18th c., it was an inconsiderable town, and has only risen into importance within the last 100 years. It has suffered much from inundations of the Danube on several occasions, on one of which, in 1838, 2280 houses were destroyed. In May 1849, while Görgei, with an army of 40,000 Hungarians, occupied the heights above Buda, and bombarded the fortress, which was held for the imperial government by General Hentzi, the latter general retaliated by bombarding P.; but on the night of the 20th May, the Hungarians stormed and took the fortress; and on the following morning, raised above its battlements the standard of revolt. On the field of Rákös, in the vicinity, where the great national assemblies of the Magyars used to be held, horse-races, on the English model, now take place annually.

PESTILENCE. The terms Plague and Pestilence, corresponding to the Greek *Loimos* and the Latin *Pestis*, have, until recent times, been used indiscriminately to denote any diseases of an epidemic character which affected large masses of the community, and were remarkable for their fatality,

such as the oriental plague, the sweating sickness, cholera, certain virulent forms of fever, &c. 'Thus,' says Dr Craigie, in his learned work on *The Practice of Physic* (vol. i. p. 349), 'the term *Loimos* was applied by the Greeks to designate a species of epidemic remittent fever; and the plague of Athens described by Thucydides is manifestly an epidemic form of the same disease, which has been at all times in the summer season endemic on the coasts and islands of the Mediterranean and Archipelago. The instances of *Loimos*, so frequently mentioned by Dionysius of Halicarnassus, and of *Pestis*, so often mentioned by Livy and other Roman historians in the early history of Rome, are manifestly the remittent or remittent-continuous fever, which has been at all times the native product of that district, and which acquired, after inundations of the Tiber, or a certain train of weather, the characters of a very generally diffused, a very malignant, and a very mortal distemper. Numerous instances of a similar inaccurate mode of expression occur in designating the remittent fevers of the middle ages and of modern times; and we find, even in the early history of the colonisation of the West Indian Islands and the United States, frequent examples of the term plague being applied to the remittent fever of these regions, and especially to epidemic attacks of yellow fever.' During the middle ages, we find the term *Pestis* applied to numerous disorders, such as syphilis, small-pox, erysipelas, epidemic sore throat, petechial fever, the sweating sickness, gangrenous pneumonia, ergotism, &c.

Several Hebrew words are translated *pestilence* or *plague*, in the authorised version of the Old Testament. Some of these pestilences were sent as special judgments, and are beyond the reach of inquiry; others have the characteristics of modern epidemics, in so far as their action was not unnaturally rapid, and they were general in their attacks. Sufficient data are not in our possession to enable us to identify with certainty any of these epidemics. It has been supposed by some critics that in some of these cases (as in Deuteronomy, xxviii. 27; Amos, iv. 10; and Zechariah, xiv. 18; and in the case of Hezekiah) the oriental plague is referred to; but Mr Poole (Smith's *Dictionary of the Bible*, vol. ii. p. 883) is of opinion that there is not any distinct notice of this disease in the Bible.

PESTO. See PAESTUM.

PETAL. See COROLLA.

PETARD, an instrument for blowing open gates, demolishing palisades, &c. It consists of a half-cone of thick iron filled with powder and ball; this is firmly fastened to a plank, and the latter is provided with hooks, to allow of its being attached securely to a gate, &c. The engineers attached the petard, lighted the slow-match by which it was to be fired, and fled. When the explosion took effect, a supporting column charged through the breach, while the defenders were yet in consternation. The petard has been almost universally superseded by the use of powder-bags. Large petards contained as much as 13 lbs. of powder.

PETCHARY, the popular name of a number of species of the genus *Tyrannus*, sometimes ranked with the Shrikes (*Laniadæ*), and sometimes with the Fly-catchers (*Muscicapidæ*). The name seems to be derived from the cry of the GRAY P. (*T. Dominicensis*), a bird very common in the warm parts of America and in some of the islands of the West Indies, gregarious and migratory, spending the spring and summer in the islands, and retiring to the hottest parts of the mainland from the end of September to the beginning of January. Its cry is a kind of shriek, consisting of three or four shrill

notes, incessantly repeated. The entire length of the GRAY P. is about 9½ inches. It is a very bold and strong bird, and in defence of its young, will maintain the battle against any hawk. It feeds partly on insects, sometimes on humming-birds, and partly on berries. When fat, it is much esteemed for the table, and great numbers are shot on this account.—The COMMON P. (*T. caudifasciatus*) is one of the most common birds of the West Indies. At certain seasons of the year, when very fat, it is in great request for the table. This bird has been observed to play with a large beetle, as a cat does with a mouse, letting it drop, and catching it before it can reach the ground. It is a very bold bird, and does not scruple to attack a dog passing near its nest.

PETCHORA, a large river in the north of European Russia, rises on the western slope of the Ural Mountains, flows north through the eastern parts of the governments of Vologda and Archangel to about 66° 25' N., then south-east for about 150 miles, and finally sweeping towards the north, and expanding into an estuary 30 miles wide and full of islands, falls into the Arctic Ocean, after a course of 940 miles. It is said to be navigable for large river-boats for upwards of 700 miles. The estuary, which is open from the middle of June till the middle of September, has a depth of from 20 to 30 feet. The country through which this river flows is still quite uncultivated; dense forests extend on both sides, and the character of the scenery is wild, sombre, and melancholy. The forests abound in larchwood, now largely used in the construction of iron-clad vessels. Within recent years, a colony has settled at the mouth of the P., for the purpose of felling, dressing, and exporting timber.

PETE'CHILÆ. This term is given to spots of a dusky crimson or purple colour, quite flat, with a well-defined margin, and unaffected by pressure, which closely resemble flea-bites. These spots result from a minute extravasation of blood beneath the cuticle. They occur most frequently on the back, at the bend of the elbow, and in the groin. They indicate an altered state of the blood, and are often symptoms of very serious diseases, as of typhus fever, plague, scurvy, &c. They likewise occur in very severe cases of small-pox, measles, and scarlet fever, when their presence must be regarded as indicative of extreme danger.

PETER, St, apostle, named originally SIMON, was a native of Bethsaida, on the Lake of Gennesaret. His father was called Jonas; and the name by which P. is known in Christian history was given to him by our Lord, who changed his name of origin (Bar-Jona) into *Cephas*, a Syro-Chaldaic word, which means 'rock' or stone, and for which *Petra*, or, in the masculine form, *P-tros*, is the Greek equivalent. He was a fisherman by occupation, and, together with his brother Andrew, was actually engaged in this occupation on the Sea of Galilee when our Lord called both to be his disciples, promising to 'make them fishers of men.' For this invitation they had been prepared by the preaching of John the Baptist, and they accepted it without hesitation. For the incidents recorded of P.'s life as a disciple, we must refer to the gospel narrative. These incidents all chiefly evince a warm and impulsive character, even down to the hour of weakness in which he denied his Master. It is plain from the gospel narrative that he was regarded by our Lord with special favour and affection, and the events which followed the ascension of our Lord fall in with this inference from that narrative. He was the first mover of the election

and a new apostle in the room of Judas Iscariot; he was the spokesman of the rest on the day of Pentecost; he it was who answered to the charges when they were brought before the council; he is the chief actor in the tragic scene of the death of Ananias and Sapphira; he was the first to break down the wall of the prejudice of race by receiving a Gentile convert into the church; he was the first to propound in the council of Jerusalem the question to be discussed as to the obligation of the Mosaic observances. The last incident of P.'s life supplied by the Scripture narrative is his presence in the council of Jerusalem, 49 A.D. Of his subsequent career, our only knowledge is derived from tradition. His special mission was to the Hebrew race, as Paul's to the Gentile; and he is supposed to have preached through Pontus, Galatia, Cappadocia, Asia, and Bithynia, chiefly to those of his own nation dispersed in these countries, all which are named in the address of the first of the two Epistles which he has left. Another tradition which, until the 16th c., met general acceptance, reports that he preached at Rome, that he took up his residence there as bishop, and that he there suffered martyrdom. This tradition is the main foundation of the Roman claim to supremacy in the church. It early encountered the opposition of the reformers; its first antagonist being a writer named Velerius, whose work was published in 1520, and who was followed by Flachius, Salmasius, and, above all, Spanheim. This view has found a few supporters even down to our own time; but the whole current of scholarship, Protestant as well as Catholic—from Scaliger, Casaubon, Usher, Pearson, Cave, &c., down to Neander, Gieseler, Bertholdt, Olshausen, and others in our own country—has accepted the Roman tradition without hesitation. The time of his going to Rome has also been the subject of much discussion. By some, he is alleged not to have gone to Rome till the year 63, or, at all events, a short time before his martyrdom; others date his first visit as early as 42 or 43, without, however, supposing his residence after this date to have been continuous. In his first Epistle, it is implied that at the time of writing it he was at Babylon; and the name Babylon is by many critics held to be employed as a mystic designation of Rome, in accordance with a practice not unusual with the Hebrews and other orientals; but there is nothing to fix very conclusively the date of this Epistle. He is held by Roman Catholic writers to have fixed his see at Antioch before his coming to Rome; but of this supposed event also, the date is uncertain. His martyrdom is fixed in, with much probability, the year 66, and is supposed to have been at the same time and place with that of St Paul. P. was sentenced to be crucified, and, according to the tradition (preserved by Eusebius from Origen), prayed that he might be crucified with his head downwards, in order that his death might exceed in ignominy that of his Divine Master.

PETER, EPISTLES GENERAL OF, the name given to two Epistles contained in the canon of the New Testament. They are called *general*, because they are not addressed to particular churches or persons, like those of St Paul; but (as in the case of the 1st Epistle) to all the Christians scattered throughout Asia Minor, or (as in the case of the 2d) to the entire body of Christians without exception. The objects of the 1st Epistle are to strengthen believers under trials; to exhort them to the earnest performance of all duties—personal, social, and domestic; and to demonstrate how thoroughly that performance depends on a spiritual recognition of Christ and his work. There is a strong eschatological tendency

in the Epistle; the apostle seems to grow more intensely serious, under the conviction that 'the end of all things is at hand' (chap. iv. 7). That the Epistle is the composition of Peter is very generally admitted. The external evidence is singularly strong; while the internal, derived from a consideration of style, sentiment, and doctrine, is equally so. We see in every sentence the ardent, impassioned, practical, unspeculative character of Peter, who held with a fine Hebraic vehemence of faith the great facts and principles of Christianity, but could not, like the more subtle and logical Paul, give them a systematic representation. Many critics have warmly praised the beauty and strength of the language.—The *Second Epistle* stands in a very different position from the first. So far as external authority is concerned, it has hardly any. The most critical and competent of the Fathers were suspicious of its authenticity; it was rarely if ever quoted, and was not formally admitted into the canon till the Council of Hippo, 393 A.D. The internal evidence is just as unsatisfactory. The great difference of style between it and the 1st Epistle is universally admitted. Bunsen, Ullmann, and Lange hold indeed that the second chapter is an interpolation, but consider the first and third genuine. Many of the ablest critics, however, regard the whole Epistle as a fabrication, and believe that its contents prove it was meant as an attack on the Gnosticism of the 2d century. [See the remarks on the Second Epistle of Peter in Neander's *Geschichte der Pflanzung und Leitung der Kirche durch die Apostel*.] The principal arguments adduced for maintaining its apostolic character are—1, that its rejection would endanger the authority of the canon; 2, that it is inexplicable how the church should have received it if it had not thought that Peter was the author.

PETER LOMBARD. See LOMBARD, PETER.

PETER-PENCE, the name given to a tribute which was collected in several of the western kingdoms, and offered to the Roman pontiff, in reverence of the memory of St Peter, of whom that bishop was believed to be the successor. From an early period, the Roman see had been richly endowed; and although its first endowments were chiefly local, yet as early as the days of Gregory the Great, large estates were held by the Roman bishops in Campania, in Calabria, and even in the island of Sicily. The first idea, however, of an annual tribute appears to have come from England, and is by some ascribed to Ina (721 A.D.), king of the West Saxons, who went as a pilgrim to Rome, and there founded a hospice for Anglo-Saxon pilgrims, to be maintained by an annual contribution from England; by others, to Offa and Ethelwulf, at least in the sense of their having extended it to the entire of the Saxon territory. But this seems very uncertain; and although the usage was certainly long anterior to the Norman Conquest, Dr Lingard is disposed not to place it higher than the time of Alfred. The tribute consisted in the payment of a silver penny by every family possessing land or cattle of the yearly value of 30 pence, and was collected in the five weeks between St Peter's and St Paul's Day and August 1. In the time of King John, the total annual payment was £199, 8s., contributed by the several dioceses in proportion, which will be found in Lingard's *History of England*, vol. ii. p. 330. The tax called *Romescot*, with some variation, continued to be paid till the reign of Henry VIII., when it was abolished. By Gregory VII., it was sought to establish it for France; and other partial or transient tributes are recorded from Denmark, Sweden, Norway, and Poland. This tribute,

however, is quite different from the payments made annually to Rome by the kingdoms which were held to be feudatory to the Roman see—as Naples, Aragon, England under the reign of John, and several other kingdoms, at least for a time.

The pope having suffered a considerable diminution of his own revenue since the revolution of 1848, an effort has been made in several parts of Europe to revive this tribute. In some countries, it has been very successful, and the proceeds have been among the chief of the resources by which Pius IX. has been enabled to meet the pressure of pecuniary embarrassments under which, with his diminished territorial possessions, it was supposed that he must necessarily have succumbed.

PETER THE HERMIT, the first mover of the great medieval drama of the **CRUSADES** (q. v.), was of gentle birth, and a native of Amiens, where he was born about the middle of the 11th century. Having been educated at Paris, and afterwards in Italy, he became a soldier. After serving in Flanders without much distinction, he retired from the army, married, and had several children; but on the death of his wife, he became a monk, and ultimately a hermit. In the course of a pilgrimage to the Holy Land about 1093, he was moved by observing that the Holy Sepulchre was in the hands of the Infidel, as well as by the oppressed condition of the Christian residents or pilgrims under the Moslem rule; and on his return, spoke so earnestly on the subject to Pope Urban II., that that pontiff warmly adopted his views, and commissioned him to preach throughout the West an armed confederation of Christians for the deliverance of the Holy City. Mean in figure, and diminutive in stature, his enthusiasm lent him a power which no external advantages of form could have commanded. 'He traversed Italy,' writes the historian of Latin Christianity, 'crossed the Alps, from province to province, from city to city. He rode on a mule, with a crucifix in his hand, his head and feet bare; his dress was a long robe, girt with a cord, and a hermit's cloak of the coarsest stuff. He preached in the pulpits, on the roads, in the market-places. His eloquence was that which stirs the heart of the people, for it came from his own—brief, figurative, full of bold apostrophes; it was mingled with his own tears, with his own groans; he beat his breast: the contagion spread throughout his audience. His preaching appealed to every passion—to valour and shame, to indignation and pity, to the pride of the warrior, to the compassion of the man, the religion of the Christian, to the love of the brethren, to the hatred of the unbeliever aggravated by his insulting tyranny, to reverence for the Redeemer and the saints, to the desire of expiating sin, to the hope of eternal life.' The results are well known, as among those moral marvels of enthusiasm of which history presents occasional examples. All France, especially, was stirred from its very depths; and just at the time when the enthusiasm of that country had been already kindled to its full fervour, it received a sacredness and an authority from the decree of a council held at Clermont, in which Urban himself was present, and in which his celebrated harangue was but the signal for the outpouring, through all Western Christendom, of the same chivalrous emotions by which France had been borne away under the rude eloquence of the Hermit. For the details of the expedition, we must refer to the article **CRUSADES**; our sole present concern being with the personal history of Peter. Of the enormous but undisciplined army which assembled from all parts of Europe, one portion was committed to his conduct; the other being under the command of a far more skilful leader, Walter the Pennyless. P.

placed himself at their head, mounted upon his ass, with his coarse woollen mantle and his rude sandals. On the march through Hungary, they became involved in hostilities with the Hungarians, and suffered a severe defeat at Semlin, whence they proceeded with much difficulty to Constantinople. There the Emperor Alexis, filled with dismay at the want of discipline which they exhibited, was but too happy to give them supplies for their onward march; and near Nice, they encountered the army of the Sultan Solyman, from whom they suffered a terrible defeat. P. accompanied the subsequent expedition under Godfrey; but worn out by the delays and difficulties of the siege of Antioch, he was about to withdraw from the expedition, and was only retained in it by the influence of the other leaders, who foresaw the worst results from his departure. Accordingly, he had a share, although not marked by any signal distinction, in the siege and capture of the Holy City in 1099, and the closing incident of his history as a crusader was an address to the victorious army delivered on the Mount of Olives. He returned to Europe, and founded a monastery at Huy, in the diocese of Liege. In this monastery he died, July 7, 1115.

PETER (DON PEDRO) THE CRUEL. King of Castile and Leon, was the son of Alfonso XI. and Maria of Portugal, and was born at Burgos, 30th August 1334. On his father's death (1350), P. succeeded to the throne without opposition, but left the whole exercise of power to his mother, Donna Maria, and Albuquerque, his father's prime minister and chancellor. But by the instigation of his mistress (afterwards his queen), Marie de Padilla, P. emancipated himself (1353) from the guidance of the queen-mother and her coadjutor Albuquerque, taking the reins of government in his own hands. His rule being much more impartial than that of the regency, obtained exceeding popularity, which was increased by his affable manner towards the mass of his subjects; but the strict justice with which he decided all causes between the rich and poor, the clergy and the laity, combined with a haughty and imperious carriage towards them, alienated from him the nobles and clergy. The plottings of Albuquerque, who had fled to Portugal, having culminated (1354) in an outbreak in the province of Estremadura, P. marched against the rebels, but was betrayed by his brother, Henry of Trastamare, and taken prisoner (December 1354). Popular opinion now declared loudly in his favour; and having escaped from prison, he found himself speedily at the head of a powerful army, with which, despite the excommunication of the pope, he speedily reduced his opponents to submission. But this episode in his career had a disastrous influence on his character for the rest of his life. Betrayed by his relatives, and even by his mother, he became suspicious of every one; and having experienced to the full the power of his enemies, he scrupled not as to the weapons to be employed against them. The rest of his reign was devoted to the destruction of the power of the great vassals, the establishment of his own authority on the ruins of their feudal tyranny, and long continued and bloody wars with the kingdoms of Aragon and Granada. As the people, however, were in general well and justly governed, it is not improbable that he might have retained his throne in spite of his numerous enemies, had not the heavy taxes which were imposed to maintain the cost of his long wars with Aragon and Granada dissipated his popularity. Henry, who had fled to France, now seizing the favourable opportunity, returned (1366) at the head of a body of exiles, backed by Bertrand du Guesclin (q. v.) with an army of mercenaries,

and aided by Aragon, France, and the pope. P., however, by promising to England the sea-board of Biscay, with the provinces of Guipuzcoa and Logroño, and supplying a contribution of 56,000 florins, prevailed upon Edward the Black Prince to espouse his cause. Edward invaded Castile in the spring of 1367, totally defeated Henry and Du Guesclin at Navarette (April), taking the latter prisoner (releasing him almost immediately after), and speedily restoring P. to the throne. But the king disgusted his chivalrous ally by his cruelty to the vanquished, and paid no heed to his remonstrances; Edward accordingly repassed the Pyrenees, and left the misguided monarch to his fate. The whole kingdom groaned under his cruelties; rebellions broke out everywhere; and, in autumn 1367, Henry returned with 400 lances, the people immediately flocking to his standard. P.'s scanty and ill-disciplined forces were routed at Montiel (14th March 1369), and himself compelled to retire for safety within the town, whence he was treacherously decoyed and captured by Du Guesclin. He was carried to a tent, where a single combat took place between him and Henry, in which the latter would have been slain, had not some of his followers come to his aid, and slain the unfortunate P., 23d March 1369.

PETER I., ALEXIEVITCH, Czar of Russia, generally denominated **PETER THE GREAT**, was the son of the Czar Alexei Mikailovitch by his second wife, Natalia Naryskine, and was born at Moscow, 9th June 1672. His father, Alexei, died in 1676, leaving the throne to his eldest son, Feodor, P.'s half-brother. This prince, however, died in 1682 without issue, after naming P. as his successor, to the exclusion of his own full brother, Ivan. This step immediately provoked an insurrection, fomented by the children of the Czar Alexei's first marriage, the most prominent among whom was the grand-duchess Sophia, a woman of great ability and energy, but of unbounded ambition. Disdaining the seclusion customary among the females of the royal family, she shewed herself to the *Strelitz* (q.v.), excited them to fury by an ingenious story of the assassination of her brother Ivan, and then let them loose on the supporters of P.'s claims. After a carnage of three days, during which more than sixty members of the most noble families of Russia were massacred, she succeeded in obtaining the coronation (July 1682) of Ivan and P. as joint rulers, and her own appointment as regent. Up to P.'s coronation his education had been greatly neglected, but after this time he became acquainted with Lieutenant Franz Timmerman, a native of Strasburg, who gave him lessons in the military art and in mathematics; after which he had the good fortune to fall under the guidance of Lefort (q.v.), a Genoese, who initiated him into the sciences and arts of civilisation, and by shewing him how much Muscovy was in these respects behind the rest of Europe, influenced the whole of his future career. Lefort also formed a small military company out of the young men of noble family who attended P., and caused P. himself to pass, by regular steps, from the lowest (that of drummer) to the highest grade in it, rendering him all the while amenable to strict discipline. This course of training, in all probability, saved P. from becoming the mere savage despot, which his brutal and passionate disposition, and indomitable energy inclined him to be; it also protected him from the jealousy of his half-sister, the regent Sophia, who, seeing him absorbed in military exercises and other studies, imagined that he had wholly given himself up to amusement. She, however, soon discovered her error, for P., contrary to her wishes, married (February 1689), by his mother's advice, *Eudoxia*

Feodorowna, of the family of *Lapoukin*; and in October of the same year, called upon his sister to resign the government. In the ensuing contest, P. was at first worsted, and compelled to flee for his life; but he was speedily joined by the foreigners in the Russian service, with a Scotchman named *Patrick Gordon* (q.v.) and the Swiss *Lefort* at their head; and the *Strelitz*, who were his antagonist's mainstay, flocking to his standard, she resigned the contest, and was shut up in a convent, whence, till her death, in 1704, she did not cease to annoy him by her intrigues. On October 11, 1689, P. made his public entry into Moscow, where he was met by Ivan, to whom he gave the nominal supremacy and precedence, reserving the sole exercise of power for himself. Ivan only enjoyed his puppet sovereignty till 1696. Though P. was all his life under the dominion of ungovernable passions and sensual habits, yet during great part of his reign he was so exclusively engaged in projecting and carrying out his schemes for the regeneration of Russia, that his gross animal nature had little opportunity of displaying itself.

His first care, on assuming the government, was to form an army disciplined according to European tactics, in which labour he was greatly aided by the valuable instructions of *Gordon* and *Lefort*, both of whom were military men, and had served in some of the best disciplined armies of Western Europe. He also laboured to create a navy, both armed and mercantile; but at this period Russia presented few facilities for such an attempt, for she was shut out from the Baltic by Sweden and Poland (the former of whom possessed Finland, *St Petersburg* (then called *Ingria*), and the Baltic provinces), and from the Black Sea by Turkey, which, extending along the whole of the north coast, had reduced that sea to the rank of an inland lake; leaving only the White Sea and the Arctic Ocean, with the solitary port of *Archangel*, available for the Russian navy. P. thinking the possession of a portion of the Black Sea would best supply the required facilities of accessible sea-board and port, declared war against Turkey, and took (1696) the city of *Azof* at the mouth of the *Don*, after a long siege, which the ineffective condition of his newly-disciplined army compelled him to convert into a blockade. Skilled engineers, architects, and artillerymen were now invited from Austria, Venice, Prussia, and Holland; ships were constructed; the army further improved both in arms and discipline; and many of the young nobility ordered to travel in foreign countries, chiefly in Holland and Italy, for the purpose of acquiring such information as might be useful in the modernisation and civilisation of their country. They were ordered to take special notice of all matters in connection with ship-building and naval equipments. Others were sent to Germany to study the military art. Not quite satisfied with this arrangement, P. was eager to see for himself the countries for which civilisation had done so much, and which had so highly developed the military art, science, trade, and industrial pursuits; so after repressing a revolt of the *Strelitz* (February 1697), and dispersing them among the various provinces, he intrusted the reins of government to Prince *Romonadofski*, assisted by a council of three, and left Russia in April 1697, in the train of an embassy of which *Lefort* was the head. In the guise of an inferior official of the embassy he visited the three Baltic provinces, Prussia, and Hanover, reaching Amsterdam, where, and subsequently at *Saardam*, he worked for some time as a common shipwright. His curiosity was excessive; he demanded explanations of everything which he did not understand; and to his practice of ship-building

and kindred trades, he added the study of astronomy, natural philosophy, geography, and even anatomy and surgery. On receipt of an invitation from William III., king of England, he visited that country, and for three months, spent partly in London and partly at Deptford, laboured to amass all sorts of useful information. While in England he received the honorary degree of D.C.L. from the university of Oxford! He left England in April 1698, carrying with him English engineers, artificers, surgeons, artisans, artillerymen, &c., to the number of 500, and next visited Vienna, for the purpose of inspecting the emperor of Austria's army, then the best in Europe. He was about to visit Venice also, when the news of a formidable rebellion of the Strelitz recalled him to Russia, which he reached by way of Poland, arriving at Moscow 4th September 1798. General Gordon had already crushed the revolt, but these turbulent soldiers had so enraged P. against them by their frequent outbreaks, that he ordered the whole of them to be executed, even occasionally assisting in person on the scaffold. A few, however, were pardoned, and sent to settle at Astrakhan. The Czarina Eudoxia, who was suspected of complicity in the conspiracy, which had been the work of the old Russian or anti-reform party, was divorced, and shut up in a convent; the czar's own sister, Martha, was likewise compelled to take the veil. To shew his gratitude to his faithful adherents, P. conferred upon the chief of them the Order of St Andrew, now first instituted. He put the press on a proper footing, caused translations of the most celebrated works of foreign authors to be made and published, and established naval and other schools. At this period, the ordinary arithmetic was first introduced for the management of accounts, these having been previously kept by means of balls strung on a wire (the Tartar method). P. also introduced the mode of raising revenue by taxation of commodities in common use. Trade with foreign countries, which was formerly punished as a capital crime, was now permitted, or rather, in the case of the principal merchants, insisted upon. Many improvements in dress, manners, and etiquette were introduced authoritatively among the public functionaries, and recommended to the people at large. Even the organisation of the national church could not escape P.'s reforming zeal.

In 1700, P., desirous of gaining possession of Carélia and Ingria, provinces of Sweden, which had formerly belonged to Russia, entered into an alliance with the kings of Poland and Denmark to make a combined attack on Sweden, taking advantage of the tender age of its monarch, Charles XII.; but he was shamefully defeated at Narva, his raw troops being wholly unable to cope with the Swedish veterans. P. was by no means disheartened, for, taking advantage of the Swedes being employed elsewhere, he quietly appropriated a portion of Ingria, in which he laid the foundation of the new capital, St Petersburg, 27th May 1703. Great inducements were held out to those who would reside in it, and in a few years it became the Russian commercial dépôt for the Baltic. In the long contest with Sweden, the Russians were almost always defeated, but P. rather rejoiced at this, as he saw that these reverses were administering to his troops a more lasting and effective discipline than he could have hoped to give them in any other way. He had his revenge at last, in totally routing the Swedish king at Poltava (q. v.), 8th July 1709, and in seizing the whole of the Baltic provinces and a portion of Finland in the following year. His success against Sweden helped much to consolidate his empire, and to render his subjects more favourably disposed towards the new order of things. After

re-organising his army, he prepared for strife with the Turks, who, at the instigation of Charles XII (then residing at Bender), had declared war against him. See OTTOMAN EMPIRE. In this contest, P. was reduced to such straits that he despaired of escape, and, looking forward to death or captivity, wrote a letter to his chief nobles, cautioning them against obeying any orders he might give them while a captive, and advising them regarding a successor to the throne in case of his death. But the finesse and ability of his mistress, Catharine, afterwards his wife and successor (see CATHARINE I.), extricated him from his difficulties; and a treaty was concluded (23d July 1711) by which Peter lost only his previous conquest—the port of Azof and the territory belonging to it. Shut out from the Black Sea, the possession of a good sea-board on the Baltic became the more necessary to him, and the war against Sweden in Pomerania was accordingly pushed on with the utmost vigour. On 2d March 1712, his marriage with his mistress, Catharine, was celebrated at St Petersburg; and two months afterwards, the offices of the central government were transferred to the new capital. His arms in Pomerania and Finland were crowned with success, and in 1713 the latter province was completely subdued. P. neglected nothing to develop the naval power of the empire, and the strictness with which he enforced the discharge of their duties on his ministers and officers, appears from the refusal, by the court of admiralty, of the czar's own application for the grade of vice-admiral, until by defeating the Swedish fleet at Hangoend, and taking the Aland Isles, and several coast-forts in Finland, he had merited the honour. In the end of 1716, and beginning of 1717, in company with the czarina, he made another tour of Europe, this time visiting Paris, where he was received with great empressement, and returned to Russia in October 1717, carrying with him books, paintings, statues, &c., to a large amount. It was soon after this time that he ordered his son Alexei (q. v.) to be executed, and many of the nobles who had been implicated in his treasonable plans were punished with savage barbarity. In 1721 peace was made with Sweden, and on condition of that power giving up the Baltic provinces, Ingria (now government of St Petersburg), Viborg, and Kexholm, and a small portion of Finland, with all the islands along the coast from Courland to Viborg, she received back the rest of Finland, with a sum of £400,000. In 1722 P. commenced a war with Persia, in order to open up the Caspian Sea to Russian commerce (see PERSIA). The internal troubles of Persia compelled the shah to yield to the demands of his formidable opponent, and to hand over the three Caspian provinces along with the towns of Derbend and Baku. On P.'s return to his capital, he inquired into the conduct of his finance ministers, and punished with fines, imprisonment, and even death, those whom he detected in fraudulent acts. To save the empire which he had established and constituted from being abandoned to the weak government of a minor, he, in February 1722, promulgated his celebrated law of succession (see PETER II.). For the last years of his life he was chiefly engaged in beautifying and improving his new capital, and carrying out plans for the more general diffusion of knowledge and education among his subjects. In the autumn of 1724 he was seized with a serious illness, the result of his imprudence and now habitual excesses; and after enduring much agony, he expired, 8th February 1725, in the arms of the empress.

PETER II., ALEXEIVITCH, Czar of Russia, was the sole male representative of Peter the Great, being the son of the unfortunate Alexei (see

PETER I.) by his wife the Princess Charlotte of Brunswick-Wolfenbüttel, and was born 23d October 1715 at St Petersburg. On the death of the Czarina Catharine I., he ascended the throne, May 17, 1727, in accordance with a decree of Peter the Great, which enjoined that each czar should name his successor; and the ambitious Menchikoff, who hoped to govern more easily in the name of a minor, prompted the empress to choose P. In order to secure himself in his high position, Menchikoff affianced one of his daughters to the youthful czar, and compelled his relative, Anna Petrowna, and her husband, the Duke of Holstein, to retire to their own estates. But, notwithstanding these and other precautions, his power was overturned by a mere child, a playfellow of the boy-ruler, who was of the powerful family of Dolgorouki. Instigated by his friends, this boy, Ivan Dolgorouki, opened the eyes of his sovereign to the humiliating dependence in which he was held by Menchikoff, and inspired him with a strong desire to free himself. The plan succeeded, and the minister and his family were exiled to Siberia, the Dolgorouki family taking their place as favourites. The marriage of a lady of this family with P. had been arranged, and was almost on the point of being celebrated, when he was seized with small-pox, and died at St Petersburg, January 29, 1730. During his reign, the three Caspian provinces, Asterabad, Ghilan, and Mazanderan, which had been seized by Peter the Great, were recovered by Persia.

PETER III. FEODOROVITCH, Czar of Russia, grandson of Peter the Great (being the son of his eldest daughter Anna Petrowna, wife of Karl Friedrich, Duke of Holstein-Gottorp), was born at Kiel, March 4, 1728, and on November 18, 1742, was declared by the czarina Elizabeth (q. v.), her successor on the throne of Russia. From the time of his being publicly proclaimed heir, he lived at the Russian court; and, in obedience to the wishes of the czarina, married Sophia-Augusta, a princess of Anhalt-Zerbst, who, on entering the Greek Church (a necessary condition of marriage of a foreigner with the czar present or presumptive), assumed the name of Catharina Alexiowna. P. succeeded Elizabeth on her death, June 5, 1762; and his first act of authority was to withdraw from the confederate league of France, Austria, and Russia against Prussia, restoring to the heroic monarch of the latter kingdom, Frederic II., the provinces of Prussia Proper, which had been conquered during the Seven Years' War, and sending to his aid a force of 15,000 men; a line of conduct which seems to have been prompted solely by his admiration for the Prussian sovereign. He also recalled many of the political exiles from Siberia, among whom were L'Estocq, Munnich, and the Duke of Courland; abolished the sanguinary law which proscribed any one who should utter a word against the Greek church, the czar, or the government; and then attempted the realisation of his favourite project, which was to recover from Denmark that portion of Slesvig which had been ceded to her in 1713, and to avenge the tyranny and annoyances to which his family—that of Holstein-Gottorp—had been subjected. But before the army he had despatched could reach its destination, a formidable conspiracy, headed by his wife, and supported by the principal nobles, had broken out against him. This conspiracy originated in the general discontent which was felt at the czar's conduct and government; for the nobility were offended at his liberal innovations, and the preference he shewed for Germans; the people and clergy, at his indifference to the national religion, and his ill-concealed contempt for Russian manners and customs; while the whole nation

murmured at his servility to Frederic II. of Prussia. His wife had still deeper cause for dislike; for though he was himself addicted to drunkenness and debauchery, he never ceased to reproach her with her infidelities, and had even planned to divorce her, disinherit her son Paul (q. v.), and elevate his mistress Elizabeth Woronzof to the conjugal throne. The revolution broke out on the night of the 8th July 1762; P. was declared to have forfeited his crown, and his wife Catharine was proclaimed czarina as Catharine II. (q. v.) by the Guards, the clergy, and the nobility. P., who was then at Oranienbaum, neglecting the counsels of Field-marshal Munnich, who proposed to march at once on the capital at the head of the regiments which were still faithful, or at any rate to take secure possession of Cronstadt and the fleet, soon found even the opportunity of flight cut off, and was compelled to submit. He abdicated the crown on 10th July, and on the 14th of the same month was put to death by Orlof (q. v.), to secure the safety of the conspirators.

PETERBOROUGH, an episcopal city and parliamentary borough of Northamptonshire, stands on the left bank of the Nen—which is thus far navigable for boats—37 miles north-east of Northampton, and 76 miles north-north-west of London by railway. The Great Northern, the Eastern Counties', the Northampton and Peterborough, and the Midland Counties' railways pass the city, and have stations here. P. is regularly laid out, has an excellent grammar-school with an endowment, a corn-exchange in the Italian style, a jail and house of correction, a handsome parish-church, and a number of chapels and meeting-houses, schools, and charitable institutions.

But the great edifice of P. is the famous cathedral, which holds a high, if not the highest rank among English cathedrals of the second class. The choir and eastern aisles of the transept (built 1118—1133) are early Norman; the transept (1155—1177) is middle Norman; the nave (1177—1193) is late Norman; the western transept (dating from the same period), is transition Norman; the west front, which, as a portico (using that term in its classical sense), is said to be the grandest and finest in Europe, is early English; and the eastern aisle (begun in 1438, but not completed till 1528), is Perpendicular. The beautiful western front consists of three arches 81 feet in height, supported by triangular piers detached from the west wall. Each arch is surmounted by a beautiful pediment and cross. The front is flanked on each side with turrets 156 feet high, and crowned with pinnacles. The roof of the nave is painted in lozenge-shaped divisions, containing figures of kings, bishops, grotesques, &c., in colours. A central tower, lantern-shaped, rises at the intersection of the nave and transept. In the north-choir aisle, a slab of blue stone still covers the remains of Catharine of Aragon. On the stone is carved the simple inscription, 'Queen Catharine, A.D. 1536.' In July 1587, the remains of Mary, Queen of Scots, were brought here from Fotheringay for interment, and here they rested until, twenty-five years after, they were removed to Westminster Abbey. The entire length of the cathedral is 476 feet 5 inches; the breadth of nave and aisles, 78 feet; height of the ceiling of the church, 78 feet; breadth of the church at the great transepts, 203 feet; height of lantern, 135 feet; length of western front, 156 feet; height of central tower from the ground, 150 feet.

P. carries on an active trade in corn, coal, timber, lime, bricks, and stone. The borough returns two members to the House of Commons. Population (1851), 8672; (1861), 11,735; (1881), 21,219.

The city had its origin in a great Benedictine monastery, founded in 655 by Oswy, king of Northumbria, and Peada, son of Penda, king of Mercia. This monastery, which became one of the wealthiest and most important in England, was reared in honour of St Peter; but it was not until after being destroyed by the Danes in 807, and rebuilt about 966, that the town was called Peterborough. On the dissolution of the monasteries, this magnificent edifice was spared, owing, it is supposed, to its containing the remains of Queen Catharine of Aragon.—Murray's *Handbook to the English Cathedrals*.

PETERBOROUGH, LORD. See MORDAUNT.

PETERHEAD, a seaport and municipal and parliamentary borough, Aberdeenshire, stands on a peninsula, the most eastern point of land in Scotland, 44 miles north-north-east of Aberdeen, by the Great North of Scotland Railway. It is irregularly built, is clean, and is paved in many cases with the reddish granite, which receives its name from the town. A large portion of the parish, and the superiority of the town of P. formerly belonged to the Marischal family, 1715. This valuable possession became, in process of time, by purchase the property of the Merchant Maiden Hospital of Edinburgh, the governors of which have latterly done much in the way of improvement both for the town and port. P. contains no very striking edifices. Its parish church has a granite spire, 118 feet in height, and a granite pillar of the Tuscan order stands on the market-cross. There are Episcopal, Free Church, Roman Catholic, and other chapels; an academy and other schools, and two libraries. Recently, cloth and winey manufactures have been introduced; ship-building is carried on to a considerable extent; herrings, cod-fish, butter, grain, and granite are exported, and lime, wool, and general merchandise are imported. P. was long famous as the chief dépôt of the seal and whale-fisheries in Britain; but within recent years the fisheries have been generally unprofitable, and this interest has declined. In 1864 about 20 vessels, a larger number than that sent out by any other British port, were employed in the different branches of this trade. The coast-fisheries are still vigorously prosecuted, and in the season a fleet of 300 herring-boats put out from the harbours in the evening. P. is the second fishing-station in Scotland. In 1863, upwards of 27,000 barrels of cured herrings were exported to the Continent. In 1872, 738 vessels, of 52,945 tons, entered, and 672, of 49,275 tons, cleared, the port. The two harbours are respectively on the north and south side of the isthmus of the peninsula on which the town is built, and a passage connecting them has been cut across the isthmus, so that vessels can leave harbour in any state of the wind. This town has often been proposed as a Harbour of Refuge. On the south side of the bay of P., and about 2½ miles from the town, is Buchanness, and near it are the picturesque ruins of Boddam Castle. Invergie and Ravenscraig castles, now mere ruins, are finely situated on the banks of the Ugie, which enters the sea a mile north of the town. P. unites with the Elgin (q. v.) boroughs in sending a member to parliament. Pop. of parliamentary borough (1851), 4762; (1861), 7541; (1881), 10,992.

PETERLOO MASSACRE, the name popularly given to the dispersal of a large meeting by armed force in St Peter's Field, Manchester, Monday, July 16, 1819. The assemblage, consisting chiefly of bodies of operatives from different parts of Lancashire, was called to consider the question of parliamentary reform, and the chair, on open hustings, was occupied by Mr Henry Hunt. The dispersal

took place by order of the magistrates; several troops of horse, including the Manchester Yeomanry, being concerned in the affair, of which an account will be found in *History of the Peace*, by Harriet Martineau, edition of 1858, p. 107. Five or six persons were killed and many wounded. St Peter's Field is now covered by buildings. Peterloo was a fanciful term, suggested by Waterloo.

PETER'S, ST. CHURCH, at Rome, is the largest cathedral in Christendom. It stands on the site of a much older basilica, founded by Constantine, A.D. 306, over the reputed grave of St Peter, and near the spot where he is said to have suffered martyrdom. This basilica was of great size and magnificence; but had fallen into decay, when Pope Nicholas V., in 1450, resolved to erect a new cathedral, worthy of the dignity and importance of the Roman pontificate, then in the zenith of its power. A design was accordingly prepared by Rossellini on a very grand scale, and the tribune was begun, when the pope died. The new building remained neglected for about half a century, when Julius II. resolved to carry out the building, and employed Bramanté, then celebrated as an architect, to make a new design. This design still exists. The foundation stone was laid, in 1469; and the works carried on with great activity till the death of the pope in 1513. Bramanté, who died the following year, was succeeded by Baldassare Peruzzi. Almost every architect who was employed during the long course of time required for the erection of this great edifice, proposed a new design. That of San Gallo, who succeeded Peruzzi, is one of the best, and is still preserved. It was not till his death in 1546, when the superintendence devolved on Michael Angelo, then seventy-two years of age, that much progress was made. He designed the dome; and had the satisfaction, before his death in his ninetieth year (1564), of seeing the most arduous part of the task completed; and he left such complete models of the remainder that it was carried out exactly in conformity with his design by his successors, Vignola and Giacomo della Porta, and successfully terminated by the latter in 1590 in the pontificate of Sixtus V. The design of Michael Angelo was in the form of a Greek cross, but the building was actually completed as originally designed by Bramanté as a Latin cross, under Paul V., by the architect Carlo Maderno. The portico and façade were also by him. He is much blamed for altering Michael Angelo's plan, because the result is that the projecting nave prevents the dome (the great part of the work) from being well seen. The façade is considered paltry, and too much cut up into small pieces. It is observable that this entrance façade is at the east end of the church, not the west, as it would certainly have been north of the Alps. But in Italy the principle of orientation was little regarded.

Maderno's nave was finished in 1612, and the façade in 1614, and the church dedicated by Urban VIII. in 1626. In the front of the portico is a magnificent atrium in the form of a piazza, enclosed on two sides by grand semicircular colonnades. This was erected under Alexander VII. by the architect Bernini.

The façade of the cathedral is 368 feet long and 145 feet high. As already mentioned, the design is not generally approved, but some allowance must be made for the necessities of the case. The balconies in the front were required, as the pope, at Easter, always bestows his blessing on the people from them. Five open arches lead into a magnificent vestibule, 439 feet long, 47 feet wide, and 65 feet high, and adorned with statues and mosaics. Here is preserved a celebrated mosaic of St Peter

walking on the sea, called the Navicella, designed by Giotto in 1298, and preserved from the old basilica. The central bronze doors are also relics saved from the old church. On entering the interior of the cathedral, its enormous size does not produce the impression its grandeur of proportions should do on the spectator. This arises from the details being all of an excessive size. The pilasters of the nave, the niches, statues, mouldings, &c., are all such as they might have been in a much smaller church, magnified. There is nothing to mark the scale, and give expression to the magnitude of the building. The figures supporting the holy water fountain, for example, appear to be those of cherubs of a natural size, but when more closely approached, turn out to be six feet in height, and the figures in the niches are on a still more colossal scale. The cathedral is 613 feet long, and 450 feet across the transepts. The arch of the nave is 90 feet wide, and 152 feet high. The diameter of the dome is 195½ feet. From the pavement to the base of the lantern is 405 feet, and to the top of the cross 434½ feet. The dome is thus 50 feet wider, and 64 feet higher than that of St Paul's (q. v.) in London.

The walls of the interior are adorned with plates of the richest marbles, and copies of the most celebrated paintings executed in mosaic. The arch piers have two stories of niches with statues of saints, but these, unfortunately, are in a debased style of art. The pavement is all in marbles of different colours, arranged in beautiful patterns designed by Giacomo della Porta. The dome is, however, the finest part of the cathedral; it is supported on four great arches. Immediately under the dome stands the high altar over the grave of St Peter. It is surmounted by a magnificent baldacchino or canopy, in bronze, which was designed by Bernini in 1633, and executed with bronze stripped from the Pantheon by Pope Urban VIII. Beneath the high altar is the shrine, in which 112 lamps burn day and night. The building is adorned with many remarkable monuments and statues, some of them by Michael Angelo, Canova, and Thorwaldsen. The most of the monuments are erected in memory of the popes, but there is one to 'James III., Charles III., and Henry IX., kings of England,' the remains of the exiled Stuarts being buried in the vaults beneath. The 'Grotte Vaticane,' or crypt, has been most carefully and religiously preserved during all the changes and works of the cathedral; so much so, that the ancient pavement remains undisturbed.

As a work of architectural art, St Peter's is the greatest opportunity which has occurred in modern times; but, notwithstanding the great names of the men who were engaged upon the work, it is universally admitted to be a grand and lamentable failure.

PETER'S, ST, COLLEGE, Cambridge, commonly called Peter-House, was founded before any other college now existing in England—viz., in 1257, by Hugh de Balsham, Bishop of Ely, and was endowed by him in 1282, with a maintenance for a master and 14 fellows. In addition to the 14 original foundation-fellows, there are eight by-fellows on different foundations, and 23 scholars. The master is elected by the society.

PETERSBURG, a town and port of entry of Virginia, on the south bank of the Appomattox River, and 30 miles S. of Richmond. It is well built, and is in the order of population the third town in the State. It contains churches of the Presbyterians, Methodists, Episcopalians, Baptists, and Catholics; there are several cotton and woollen factories, forges, and numer-

ous mills, to which the falls in the river furnish extensive power. It is connected by railroad with Baltimore, Wilmington, N. C., Norfolk, and Richmond. In the late war of secession P. was an important military point in the defence of Richmond, and was the scene of many sanguinary encounters. On June 16, 1864, it was bombarded by Gen. Grant, who failed to carry it by assault, and withdrew, having lost 10,000 men. It was eventually taken by the Union army on the 2d of April, 1865. Pop., in 1880, 21,656.

PETERSBURG, ST. See **ST PETERSBURG**.

PETERSFIELD, a parliamentary borough and market-town in Hampshire, 23 miles east-north-east of Southampton, and 55 miles south-west of London by railway. It is a pleasant country-town, and contains a Norman parish chapel of the 12th c., and an educational institution, called Churcher's College. An equestrian statue of William III., once richly gilt, stands in the market-place. P. returns a member to the House of Commons. Pop. of borough (1861), 5655; (1871), 6104; (1881), 6546.

PETERWARDEIN, the capital of the Slavonic-Servian military frontier, and one of the strongest fortresses in the Austrian dominions, is situated in a marshy, unhealthy locality on the right bank of the Danube, 50 miles north-west of Belgrade. The ordinary garrison consists of 2000 men, besides which the town and suburbs contain a population of about 4600, mostly Germans. The most ancient part of the fortifications, the Upper Fortress, is situated on a rock of serpentine, which on three sides rises abruptly from the plain. P., situated on a narrow peninsula formed by a loop of the Danube, occupies the site of the Roman *Acumineum* (*acumen*, point), and is said to have been named in honour of Peter the Hermit, who marshalled here the soldiers of the first crusade. In 1688, the fortifications were blown up by the imperialists, and the town was soon after burned to the ground by the Turks; but at the Peace of Passarowitz, on 21st July 1718, it remained in the possession of the emperor. It was here that, on 5th August, 1716, Prince Eugene obtained a great victory over the Grand Vizier Ali.

PETIOLE. See **LEAVES**.

PÉTION DE VILLENEUVE JÉRÔME, noted for the part he played in the first French Revolution, was the son of a procurator at Chartres, and was born there in 1753. He was practising as an advocate in his native city, when he was elected in 1789 a deputy of the *Tiers Etat* to the States-General. His out-and-out republican principles, and his facile oratory, sonorous rather than eloquent, quickly made him popular, though he had an essentially mediocre understanding, and was altogether a windy, verbose personage. He was a prominent member of the Jacobin Club, and a great ally of Robespierre; the latter was called the 'Incorruptible,' and P. the 'Virtuous.' He was sent along with Barnave and Latour-Maubourg to bring back the fugitive royal family from Varennes, and in the execution of this commission he acted in an extremely unfeeling manner. He afterwards advocated the deposition of the king, and the appointment of a popularly elected regency, and along with Robespierre received, 30th September 1791, the honours of a public triumph. On the 18th of November, he was elected *Maire de Paris* in Bailly's stead, the court favouring his election, to prevent that of Lafayette. In this capacity he encouraged the demonstrations of the lowest classes, and the arming of the populace. But as the catastrophe drew near, he awoke to a sense of its terrible nature, and sought in vain to arrest the torrent. On the triumph of the

Terrorists, P.'s popularity declined, and he joined the Girondists. On the king's trial, he voted for death, but with delay of execution and appeal to the people, upon which he became suspected of being a royalist, and of partaking in the treason of Damiouriez. He was thrown into prison, 2d June 1793, on the fall of the Gironde, but escaped from prison, and joined the other Girondists at Caen. Upon the defeat of their army by that of the Convention, he fled, in July 1793, into Bretagne, and in company with Buzot reached the neighbourhood of Bourdeaux, which, however, had already submitted. A short time after, P.'s and Buzot's corpses were found in a corn-field near St Emilion, partly devoured by wolves. They were supposed to have died by their own hands. P.'s character has been defended by Madame de Genlis and Madame Roland. It appears that he was extremely virtuous in all his domestic relations; but, on the other hand, his public career shews him to have been weak, shallow, ostentatious, and vain. *Les Œuvres de Pétion*,* containing his speeches, and some small political treatises, were published in 1793.

PETITIO PRINCIPII ('a begging of the principle or question') is the name given in Logic to that species of vicious reasoning in which the proposition to be proved is assumed in the premises of the syllogism.

PETITION (Lat. *peto*, I ask), a supplication preferred to one capable of granting it. The right of the British subject to petition the sovereign or either House of Parliament for the redress of grievances is a fundamental principle of the British constitution, and has been exercised from very early times. The earliest petitions were generally for the redress of private wrongs, and the mode of trying them was judicial rather than legislative. Receivers and triers of petitions were appointed, and proclamation was made inviting all persons to resort to the receivers. The receivers, who were clerks or masters in Chancery, transmitted the petitions to the triers, who were committees of prelates, peers, and judges, who examined into the alleged wrong, sometimes leaving the matter to the remedy of the ordinary courts, and sometimes transmitting the petition to the chancellor or the judges, or, if the common law afforded no redress, to parliament. Receivers and triers of petitions are still appointed by the House of Lords at the opening of every parliament, though their functions have long since been transferred to parliament itself. The earlier petitions were generally addressed to the House of Lords; the practice of petitioning the House of Commons first became frequent in the reign of Henry IV.

Since the Revolution of 1688, the practice has been gradually introduced of petitioning parliament, not so much for the redress of specific grievances, as regarding general questions of public policy. Petitions must be in proper form and respectful in language; and there are cases where petitions to the House of Commons will only be received if recommended by the crown, as where an advance of public money, the relinquishment of debts due to the crown, the remission of duties payable by any person, or a charge on the revenues of India have been prayed for. The same is the case with petitions praying for compensation for losses out of the public funds. A petition must, in ordinary cases, be presented by a member of the House to which it is addressed; but petitions from the corporation of London may be presented by the sheriffs or lord mayor. Petitions from the corporation of Dublin have also been allowed to be presented by the lord mayor of that city, and it is believed that

a similar privilege would be acceded to the lord provost of Edinburgh.

The practice of the House of Lords is to allow a petition to be made the subject of a debate when it is presented; and unless a debate has arisen on it, no public record is kept of its substance, or the parties by whom it is signed. In the House of Commons, petitions not relating to matters of urgency are referred to the Committee on Public Petitions, and in certain cases ordered to be printed.

In the five years ending 1842 the number of petitions presented to the House of Commons was 70,072; in the five years ending 1872, 101,573.

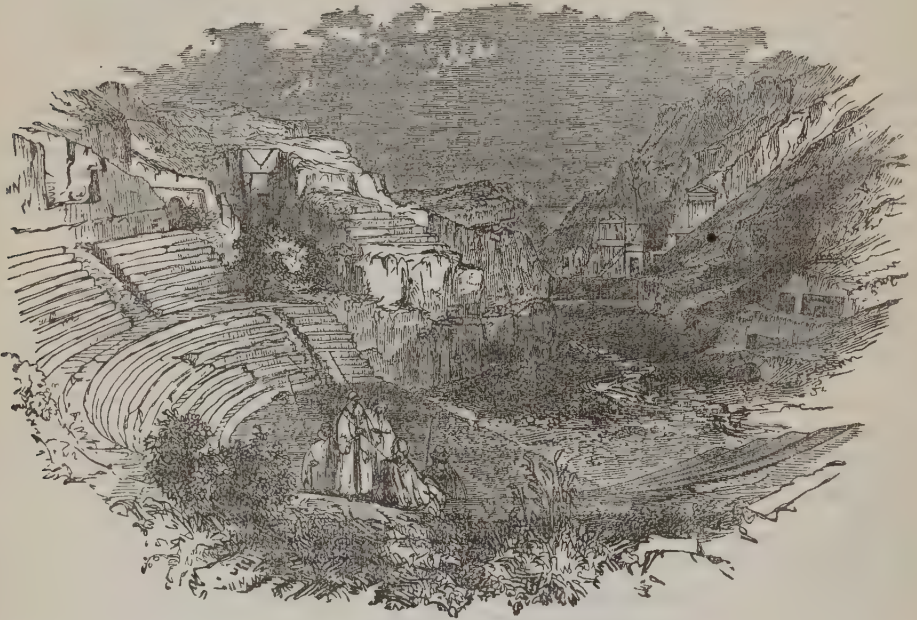

PETITION OF RIGHTS, a declaration of certain rights and privileges of the subject obtained from King Charles I. in his first parliament. It was so called because the Commons stated their grievances in the form of a petition, refusing to accord the supplies till its prayer was granted. The petition professes to be a mere corroboration and explanation of the ancient constitution of the kingdom; and after reciting various statutes, recognising the rights contended for, prays 'that no man be compelled to make or yield any gift, loan, benevolence, tax, or such like charge, without common consent by act of parliament; that none be called upon to make answer for refusal so to do; that freemen be imprisoned or detained only by the law of the land, or by due process of law, and not by the king's special command, without any charge; that persons be not compelled to receive soldiers and mariners into their houses against the laws and customs of the realm; that commissions for proceeding by martial law be revoked.' The king at first eluded the petition, expressing in general terms his wish that right should be done according to the laws, and that his subjects should have no reason to complain of wrongs or oppressions; but at length, on both Houses of Parliament insisting on a fuller answer, he pronounced an unqualified assent in the usual form of words, '*Soit fait comme il est désiré.*'

PETŌFI, SANDOR. See SUPPLEMENT in Vol. X.

PETRA (Heb. *SELA*, both names signify 'Rock') was anciently the capital of the Nabathæans, and was situated in the 'desert of Edom' in Northern Arabia, about 72 miles north-east of Akabah—a town at the head of the Gulf of Akabah, an arm of the Red Sea. It occupied a narrow rocky valley overhung by mountains, the highest and most celebrated of which is Mount Hor, where Aaron, the first Hebrew high-priest, died, and was thus in the very heart of the region hallowed by the forty years' wanderings of the Israelites. The aboriginal inhabitants were called *Horim* ('dwellers in caves'). It was then conquered by the Edomites or Idumeans (but it never became their capital); and, in the 3d or 4th c. B.C., it fell into the hands of the Nabathæans, an Arab tribe, who carried on a great transit-trade between the eastern and western parts of the world. It was finally subdued by the Romans in 105 A.D., and afterwards became the seat of a metropolitan; but was destroyed by the Mohammedans, and for 1200 years its very site remained unknown to Europeans. In 1812, Burckhardt first entered the valley of ruins, and suggested that they were the remains of ancient Petra. Six years later, it was visited by Messrs Irby, Mangles, Barks and Leigh, and in 1828 by M.M. Laborde and Linant, and since then by numerous travellers and tourists to the East, as Bartlett, Porter, and Dean Stanley. Laborde's drawings give us a more vivid impression of the ruins of P. than any descriptions, however picturesque. These ruins stand in a small open irregular basin, about half a mile square, through which runs a brook, and are best approached

by an extraordinary chasm or ravine, called the Sik, narrowing as it proceeds till in some places the width is only 12 feet, while the rocky walls of red sandstone tower to the height of 300 feet. Hardly a ray of light can pierce this gloomy gorge, yet it was once the highway to P., and the remains of an ancient pavement can be traced beneath the brilliant oleanders that now cover the pathway. All along the face of the rocky walls are

rows of cave-tombs, hewn out of the solid stone, and ornamented with façades. These are also numerous elsewhere. Originally, they were probably dwellings of the living, not of the dead—a supposition justified by an examination of their interior; but when the Nabathæans built the city proper in the little basin of the hills, they were in all likelihood abandoned, and then set apart as the family-sepulchres of those who had formerly been 'dwellers in the clefts of

Petra—Mount Seir.—From Laborde.

the rocks.' The principal ruins are—1. *El-Khuzneh* ('the Treasure-house'), believed by the natives to contain, buried somewhere in its sacred enclosure, the treasures of Pharaoh. It directly faces the mouth of the gorge we have described, and was the great temple of the Petraeans. 2. *The Theatre*, a magnificent building, capable of containing from 3000 to 4000 spectators. 3. *The Tomb with the Triple Range of Columns*. 4. *The Tomb with Latin Inscription*. 5. *The Deer or Convent*, a huge monolithic temple, hewn out of the side of a cliff, and facing Mount Hor. 6. *The Acropolis*. 7. *Kusr Farôn*, or Pharaoh's palace, the least incomplete ruin of Petra. Most of the architecture is Greek, but there are also examples of the influence of Egypt, pyramidal forms being not unknown.

PETRARCA, FRANCESCO, the first and greatest lyric poet of Italy, was the son of a Florentine notary named Petracco, who belonged to the same political faction as the poet Dante, and went into exile along with him and others in 1302. Petracco took up his residence at Arezzo, and here the future poet was born in the month of July 1304. His original name was Francesco di Petracco, which he subsequently changed to that by which he is now known. When P. was about eight years of age, his father removed to Avignon, where the papal court was then held; and here, and at the neighbouring town of Carpentras, the youth studied grammar, rhetoric, and dialectics. Contrary to his own inclination, but in compliance with the wish of his father, he spent seven years in the study of law at Montpellier and Bologna; but in 1326 his father

died, and P. now devoted himself partly to the gaieties of Avignon, and partly to classical studies, or rather to the study of the Latin classics, as it was only towards the end of his life that he attempted to master Greek. At this time, he ranked among his friends, the jurist Soranzo, John of Florence, the apostolic secretary, Jacopo Colonna, Bishop of Lombes in Gascony, and his brother, the Cardinal Giovanni, Azzo da Corregio, lord of Parma, and many other noble and learned personages. His illustrious admirers—among whom were emperors, popes, doges, kings, and sovereign-dukes—obviously thought themselves honoured by their intimacy with the son of a poor notary, and some were even forward in proffering him their favour. But the great event in P.'s life (viewed in the light of its literary consequences) was his tenderly romantic and ultimately pure passion for Laura—the golden-haired, beautiful Frenchwoman. Some slight obscurity still hangs over his relation to this lady, but it was almost certain that she was no less a paragon of virtue than of loveliness. He met her on the 6th of April, 1327, in the church of St Clara in Avignon, and at once and for ever fell deeply in love with her. The lady was then 19, and had been married for two years to a gentleman of Avignon, named Hugues de Sade. For ten years P. lived near her in the papal city, and frequently met her at church, in society, at festivities, &c. He sung her beauty and his love in those sonnets whose mellifluous conceits ravished the ears of his contemporaries, and have not yet ceased to charm. Laura was not insensible to a worship which made her

emperor (Charles IV.) beg to be introduced to her, and to be allowed to kiss her forehead; but she seems to have kept the too-passionate poet at a proper distance. Only once did he dare to make an avowal of his love in her presence, and then he was sternly reproved. In 1338, P. withdrew from Avignon to the romantic valley of Vaucluse, where he lived for some years, spending his time almost solely in literary pursuits. A most brilliant honour awaited him at Rome, in 1341, where, on Easter-day, he was crowned in the Capitol with the laurel-wreath of the poet. The ceremonies which marked this coronation were a grotesque medley of pagan and Christian representations. P. was, however, as ardent a scholar as he was a poet; and throughout his whole life, he was occupied in the collection of Latin MSS., even copying some with his own hand. To obtain these, he travelled frequently throughout France, Germany, Italy, and Spain. His own Latin works were the first in modern times in which the language was classically written. The principal are his *Epistole*, consisting of letters to his numerous friends and acquaintances, and which rank as the best of his prose works; *De Vitis Virorum Illustrium*; *De Remediis utriusque Fortunæ*; *De Vita Solitaria*; *Rerum Memorandarum Libri IV.*; *De Contemptu Mundi*, &c. Besides his prose-epistles, P. wrote numerous epistles in Latin verse, eclogues, and an epic poem called *Africa*, on the subject of the second Punic War. It was this last production which obtained for him the laurel-wreath at Rome. P., it may be mentioned, displayed little solicitude about the fate of his beautiful Italian verse, but built his hope of his name being remembered on his Latin poems, which, it has been said, are now only remembered by his name. In 1353 he finally left Avignon, and passed the remainder of his life in Italy—partly at Milan, where he spent nearly ten years, and partly at Parma, Mantua, Padua, Verona, Venice, and Rome. At last, in 1370, he removed to Arquà, a little village prettily situated among the Euganean Hills, where he spent his closing years in hard scholarly work, much annoyed by visitors, troubled with epileptic fits, not overly rich, but serene in heart, and displaying in his life and correspondence a rational and beautiful piety. He was found dead in his library on the morning of the 18th July 1374, his head dropped on a book!—P. was not only far beyond his age in learning, but had risen above many of its prejudices and superstitions. He despised astrology, and the childish medicine of his times; but, on the other hand, he had no liking for the conceited scepticism of the medieval savants; and, in his *De sui Ipsius et multorum aliorum Ignorantia*, he sharply attacked the irrelevant speculations of those who had acquired a shallow free-thinking habit from the study of the Arabico-Aristotelian school of writers, such as Averrhoes. P. became an ecclesiastic, but was contented with one or two inconsiderable benefices, and refused all offers of higher ecclesiastical appointment.—The Italian lyrics of P.—the chief of which are the *Rime*, or *Canzoniere*, in honour of Laura—have done far more to perpetuate his fame than all his other works. Of Italian prose, he has left a line. The *Rime*, consisting of sonnets, canzonets, madrigals, were composed during a period of more than forty years; and the later ones—in which P.'s love for Laura, long since laid in her grave, appears purified from all earthly taint, and beautiful with something of a beatific grace—have done as much to refine the Italian language as the *Divina Commedia* of Dante. Of his *Rime*, there have been probably more than 300 editions. The first is that of Venice, 1470; the most accurate is that by Marsand (2 vols., Padua,

1819). Collective editions of his whole works have also been published (Basel, 1495, 1554, and 1581, *et seq.*) His life has employed many writers, among whom may be mentioned Bellutello, Beccadelli, Tomasini, De la Bastie, De Sades, Tiraboschi, Baldelli, and Ugo Foscolo.

PETREL (*Procellaria*), a genus of birds, sometimes ranked among *Laridæ* (q. v.), and sometimes constituted into a separate family, *Procellariidæ* which is now subdivided into several genera, and distinguished by having the bill hooked at the tip the extremity of the upper mandible being a hard nail, which appears as if it were articulated to the rest, the nostrils united into a tube which lies along the back of the upper mandible, and the hind-toe merely rudimentary. They possess great power of wing, and are among the most strictly oceanic of birds, being often seen at great distances from land. Among the *Procellariidæ* are reckoned the Fulmars (q. v.), Shearwaters (q. v.), &c., and the small birds designated STORM PETRELS, STORM BIRDS, and MOTHER CAREY'S CHICKENS. These form the genus *Thalassidroma* of recent ornithological systems, the name (Gr. sea-runner) being given to them in allusion to their apparent running along the surface of the waves, which they do in a remarkable manner, and with great rapidity, particularly when the sea is stormy, and the molluscs and other animals forming their food are brought in abundance to the surface—now descending into the very depth of the hollow between two waves, now touching their highest foamy crests, and flitting about with perfect safety and apparent delight. Hence also their name Petrel, a diminutive of Peter, from the apostle Peter's walking on the water. From the frequency with which flocks of these birds are seen in stormy weather, or as heralds of a storm, they are very unfavourably regarded by sailors. They have very long and pointed wings, passing beyond the point of the tail; and the tail is square in some, slightly forked in others. Their flight much resembles that of a swallow. They are to be seen in the seas of all parts of the world, but are more abundant in the southern than in the northern hemisphere. The names Storm P. and Mother Carey's Chicken are sometimes more particularly appropriated to *Thalassidroma pelagica*, a bird scarcely larger than a lark, and the smallest web-footed bird known, of a sooty black colour, with a little white on the wings and some near the tail. Two or three other species are occasionally found on the British shores; but this is the most common, breeding in crevices of the rocks of the Scilly Isles, St Kilda, the Orkneys, Shetland Isles, &c. Like many others of the family, it generally has a quantity of oil in its stomach, which, when wounded or seized, it discharges by the mouth or nostrils; and of this the people of St Kilda take advantage, by seizing the birds during incubation, when they sit so closely as to allow themselves to be taken with the hand, and collecting the oil in a vessel.

PETRIFICATION, a name given to organic remains found in the strata of the earth, because they are generally more or less mineralised or made into stone. The word has fallen very much into disuse, having given place to the terms Fossil (q. v.) and Organic Remains.

PETROICA, a genus of birds of the family *Sylviadæ*, natives of Australia, nearly allied to the Redbreast, and to which its familiar name Robin has been given by the colonists. The song, call-note, and manners of *P. multicolor*, a species abundant in all the southern parts of Australia, very much resemble those of the European bird, but its plumage is very different: the male having the

head, throat, and back jet-black, the forehead snowy-white, one longitudinal and two oblique bands of white on the wings, and the breast bright scarlet; the female is brown, with red breast. There are several other species, birds of beautiful plumage.

PETROLEUM, coal oil, mineral tar (Gr. *petra*, a rock, and *elaion*, oil), an inflammable, oily liquid, having a strong bituminous smell, sometimes thin, transparent, and pale, and sometimes viscid, opaque, and black. The term *Naphtha* (q. v.) is generally applied to the thinner, lighter-coloured varieties, or to the more volatile portions distilled from the native oil, while the darker are known as *Mineral tar*, and the intermediate as *Petroleum*. It occurs abundantly at Baku, on the Caspian Sea, in Burmah, Trinidad, and in the U. States and Canada. The last-named supply most of the petroleum of commerce, and the wells of Northern Pennsylvania, about the head waters of the Alleghany R., are the most prolific sources. The American product, in 1868, was 3,965,000; in 1869, 4,717,000; and in 1870, 6,535,000 bbls.; and in 12 years, from 1859 to 1870, 34,388,100 bbls. of crude petroleum. The chief bulk of Pennsylvania P. appears to be numerous Hydro-carbons (q. v.), homologues of marsh gas. On distilling P. at 100°, light oil, chiefly Benzol (q. v.), passes over; at 120° to 160°, the common burning oil is distilled and the heavy oil remains, fit only for lubricating purposes, or the production of Paraffin (q. v.).

The rock oil of Western Pennsylvania and elsewhere had long been known as Seneca oil, but no practical movements were made towards obtaining it in abundance until 1854, when a company was formed for boring on Oil Creek, Venango Co., Pa., which proved successful in 1858. A well bored to the depth of 72 ft. yielded 1000 gals. daily, and which, awakening an extraordinary enthusiasm, led to much reckless expenditure and wild gambling speculation. See Daddow, S. H., and Bannan, B., *Coal, Iron, and Oil*, Pottsville, 1866; Bowen, L., *Coal and Coal Oil*, Philada., 1865.

PETRONIUS, C., a Roman Voluptuary at the court of Nero, whose profligacy is said to have been of the most superb and elegant description. We know, however, very little about him. He was at one time proconsul of Bithynia, was subsequently appointed consul, and is certified as having performed his official duties with energy and prudence. But his grand ambition was to shine as a court-exquisite. He was a kind of Roman *Brummell*, and Nero thought as highly of him as did the Prince Regent of the famous Beau. He was entrusted by his imperial master and companion with the charge of the royal entertainments, and thus obtained (according to Tacitus) the title of *Arbiter Elegantie*. Nero would not venture to pronounce anything *comme il faut*, until it had received the approval of the oracle of Roman fashion. The influence which he thus acquired was the cause of his ruin. Tigellinus, another favourite of Nero, conceived a hatred of P., brought false accusations against him, and succeeded in getting his whole household arrested. P. saw that his destruction was inevitable, and committed suicide (66 A. C.), but in a languid and graceful style, such, he thought, as became his life. He opened some veins, but every now and then applied bandages to them, and thus stopped the flow of blood, so that he was for a while enabled to gossip gaily with his friends, and even to appear in the streets of Cumæ before he died. We are told that he wrote, sealed, and despatched to Nero, a few hours before his death, a paper containing an account of the tyrant's crimes and flagitious deeds. It has been generally supposed that P. is the author of a well-known work entitled, in the oldest MSS., *Petronii Arbitri Satyricon*, a series of fragments belonging apparently

to a very extensive comic novel or romance (see NOVELS), the greater portion of which has perished, but there is really no satisfactory evidence to shew whether or not he was so. It is probable, however, that the work belongs to the 1st c. A. D. The fragments exhibit a horrible picture of the depravity of the times; but there is no indication that the author disapproves of what he describes. The *editio princeps* of the fragments appeared at Venice in 1499; later editions are those of Burmann (Traj. ad Rhen. 1709; 2d edit. Amst. 1743) and of Antonius (Leip. 1781).

PETROPAVLOVSK, a small port of Russian Siberia, near the mouth of the river Avatcha, on the east coast of the peninsula of Kamchatka. Lat. 53° N., long. 158° 44' E. It has only 479 inhabitants, and has lost much of its former importance since its desertion by the Russians in 1855, and the removal of its garrison to Nikolaevsk.

PETROZAVODSK, an important mining-town in the north of European Russia, capital of the government of Olonetz, stands on the western shore of Lake Onega, 300 miles by water north-east of St Petersburg. A cannon-foundry was erected here in 1701 by Peter the Great, who himself had discovered the rich resources of this northern region in iron and copper ores. The town itself dates from the year 1703; and from that to the present time, it has been the great centre of the mining industry of the government. The Alexandrovsky arms-factory is specially deserving of notice. It was founded in 1773, and, besides other arms, it has produced in all 30,000 pieces of cast-iron ordnance. Works are also fitted up for the preparation of steel. Wood abounds in the vicinity, and there is easy communication by water with St Petersburg. Pop. 10,648.

PETSH, or **IPEK** (i. e., silk), a town of European Turkey, in Albania, stands on the Bistritza, or White Drin, 65 miles north-east of Scutari. It is a pleasant town; the houses are large and handsome, and, as a rule, have gardens attached, in which fruit and mulberry-trees are cultivated. Water, from the river, is led up into all the houses. Silk is extensively made, tobacco and fruits are largely cultivated, and arms manufactured. P. was formerly the residence of the Servian patriarchs. Pop. 8000.

PETTY BAG OFFICE, one of the branches of the Court of Chancery, now regulated by statutes 11 and 12 Vict. c. 48, and 12 and 13 Vict. c. 109. The clerk of the petty bag, an officer appointed by the Master of the Rolls, draws up writs of summons to parliament, *Congés d'élire* for bishops, writs of *Scire facias*, and all original writs. A great deal of miscellaneous business is also transacted in the petty bag office, which the Lord Chancellor and Master of the Rolls are empowered to regulate and transfer from time to time. In the petty bag office may be brought any personal action by or against any officer of the Court of Chancery, in respect of his service or attendance.

PETTY OFFICERS in the royal navy are an upper class of seamen, analogous to the non-commissioned officers in the army. They comprise the men responsible for the proper care of the several portions of the ship, the foremen of artificers, the signalmen, and many others. They are divided into three classes: chief petty officers, at 2s. 3d. a day; 1st class working petty officers, at 2s. a day; and 2d class working petty officers, at 1s. 10d. a day. Petty officers are appointed and can be degraded by the captain of the ship. Her efficiency much depends on this useful class of sailors.

PETTY SESSIONS is the court constituted by two or more justices of the peace in England, when sitting in the administration of their ordinary jurisdiction. Though for many purposes statutes enable one justice to do acts auxiliary to the hearing and adjudication of a matter, yet the jurisdiction to adjudge is generally conferred upon the justices in petty sessions, in which case there must be at least two justices present, and this is called a petty sessions, as distinguished from quarter sessions, which generally may entertain an appeal from petty sessions. For the purpose of securing always sufficient justices, the whole of the counties of England are subdivided into what are called petty sessional divisions, those justices who live in the immediate neighbourhood being the members who form the court of such division. This subdivision of counties is confirmed by statute, and the justices at quarter sessions have power from time to time to alter it. Each petty sessions is held in some town or village which gives it a name, and a police-court or place is appropriated for the purpose of the sittings of the court. There is a clerk of each petty sessions, usually a local attorney, who advises the justices, and issues the summons and receives the fees made payable for steps of the process. The justices in petty sessions have a multifarious jurisdiction, which they exercise chiefly by imposing penalties authorised by various acts of parliament, as penalties against poachers, vagrants, absconding workmen and apprentices, &c. They also have jurisdiction to hear charges for all indictable offences, to take depositions of witnesses, and, if they think a case of suspicion is made out, to commit the party for trial at the quarter sessions or assizes, and to bind over the witnesses to attend. See also **JUSTICE OF THE PEACE**.

PETUNIA, a genus of plants of the natural order *Solanaceæ*, natives of the warmer parts of America. They are herbaceous plants, very nearly allied to Tobacco, and with a certain similarity to it in the general appearance of the foliage, which has also a slight viscidness, and emits when handled a disagreeable smell, but the flowers are very beautiful, and varieties improved by cultivation are amongst the favourite ornaments of our greenhouses and flower-borders. The petunias, although perennial, are very often treated as annuals, sown on a hot-bed in spring, and planted out in summer, in which way they succeed very well even in Scotland. They are tall plants, with branching weak stems, and may readily be made to cover a trellis. Although, when treated as greenhouse plants, they become half-shrubby, they do not live more than two or three years. The name *P.* is from the Brazilian *Petun*. The first *P.* was introduced into Britain in 1825.

PETUNTZE, a white earth used by the Chinese in the manufacture of porcelain, and said to consist of comminuted but undecomposed felspar. It is fusible, and is used for glazing porcelain.

PETWORTH, or SUSSEX MARBLE, is a thin layer of limestone, composed of the shells of freshwater Paludina. A polished slab of it was found in a Roman building at Chichester, and pillars of it exist in the cathedrals of Chichester and Canterbury.

PEUTINGERIAN TABLE. See **SUPPLEMENT** in Vol. X.

PEWS (anciently *pues*; Old Fr. *puys*; Dutch, *puys*; Lat. *podium*, 'anything on which to lean'; *s'appuyer*), enclosed seats in churches. Church-seats were in use in England some time before the Reformation, as is proved by numerous examples still extant, the carving on some of which is as early as the Decorated Period, i. e., before 1400 A. D.

and records as old as 1450, speak of such seats by the name of *pues*. They were originally plain fixed benches, all facing east, with partitions of wainscoting about three feet high, and sides of the width of the seat, panelled or carved; the sides sometimes rising above the wainscoting, and ending in finials or poppies, or else ranging with it and finished with a moulding. After the Reformation, probably under the influence of the Puritans, who, objecting to some parts of the service which they were compelled to attend, sought means to conceal their nonconformity, pews grew into large and high enclosures, containing two or four seats, lined with baize, and fitted with doors, desks, and cushions. Pews were early assigned to particular owners, but at first only to the patrons of churches. A canon made at Exeter, in 1287, rebukes quarrelling for a seat in church, and decrees that none shall claim a seat as his own except noblemen and the patrons. Gradually, however, the system of appropriation was extended to other inhabitants of the parish, to the injury of the poor, and the multiplication of disputes.

The law of pews in England is briefly this. All church-seats are at the disposal of the bishop, and may be assigned by him, either (1) directly by faculty to the holders of any property in the parish; or (2) through the churchwardens, whose duty it is, as officers under the bishop, to 'seat the parishioners according to their degree.' In the former case, the right descends with the property, if the faculty can be shewn, or immemorial occupation proved. In the latter, the right can at any time be recalled, and lapses on the party ceasing to be a regular occupant of the seat. It appears that by common law every parishioner has a right to a seat in the church, and the churchwardens are bound to place each one as best they can. The practice of *letting* pews, except under the church-building acts, or special local acts of parliament, and, much more, of *selling* them, has been declared illegal.

In Scotland, pews in the parish churches are assigned by the heritors (q. v.) to the parishioners, who have accordingly the preferable claim on them; but when not so occupied, they are legally open to all. As is well known, pews in dissenting churches are rented as a means of revenue to sustain general charges. In some parts of the United States, pews in churches are a matter of annual competition, and bring large sums. Latterly, in England, there has been some discussion as to the injuriously exclusive character of the 'pew system,' and a disposition has been manifested to abolish pews altogether, and substitute movable seats available by all indiscriminately. Several pamphlets have appeared on the subject. In the Roman Catholic churches on the Continent pews are seldom to be seen.

PEWTER, a common and very useful alloy of the metals, tin and lead. Two other kinds of pewter have a more compound character. Common, or *ley-pewter*, consists of 4 parts of tin and 1 part of lead; *plate-pewter* is made of 100 parts of tin, 8 parts of antimony, 2 parts each of bismuth and copper; another kind, called *trifle*, is composed of 83 parts of tin and 17 parts of antimony. Although these are the standard formulas, each kind is often much varied to suit the purposes of the manufacturer; the chief alteration being the addition of a large proportion of lead to the last, and a large increase of the same metal in the other two.

PÉZENAS, a manufacturing town of France, in the department of Hérault, on the left bank of the river of that name, 25 miles west-south-west of Montpellier. It stands in a district remarkable for its beauty, and so well cultivated as to have received

the name of the Garden of Hérault. It is famous for its healthy climate and clear sky. The vicinity produces excellent wine, and woollen and linen goods are manufactured. The trade, however, is chiefly in liquors, and P. is known as one of the principal brandy-markets of Europe.

PFEFFERS, an extraordinary and much-visited locality in the Canton of St Gall, Switzerland, five miles south-east of Sargans. It has been famous since the middle of the 11th c. for its hot baths, situated 2180 feet above sea-level, and 520 feet above the village of Ragatz. The old baths of P. are built on a ledge of rock a few feet above the roaring torrent of the Tamina, and are hemmed in by walls of rock towering above them to the height of 600 feet, and so far burying the baths within the gorge, that even in the height of summer, sunlight appears above them only from ten to four. Above the old baths, the walls of the ravine of the Tamina contract until they meet, covering up the river, which is there seen from a cavernous gap. The hot-springs are reached from the baths by means of a railed platform. This platform, leading to the hot spring, is secured to the rocks, and the Tamina churns its way through the cleft 30 or 40 feet below. The waters of the hot spring are now conveyed to Ragatz (about two miles below P.) by wooden pipes, 12,500 feet long. The waters, as they issue from the spring, have a temperature of 100° Fahr. A pint of the water, which is used both for drinking and bathing, contains only about three grains of saline particles.

PFEIFFER, IDA (*née* REYER), a celebrated female traveller, was born at Vienna, October 15, 1797, and from her earliest years shewed a resolute and fearless, but not unfeminine disposition. In 1820, she married an advocate, named Pfeiffer, from whom she was obliged to obtain a separation, after she had borne him two sons, Oscar and Alfred, whose education devolved on herself. When she had settled them in life, and was free to act as she pleased, she at once proceeded to gratify, at the age of 45, her long-cherished inclination for a life of travel and adventure. Her first expedition was to the Holy Land. She left Vienna in March 1842, and returned in December of the same year, having traversed, alone and without guide, European and Asiatic Turkey, Palestine, and Egypt. She published an account of her eastern rambles in the following year (*Reise einer Wienerin in das Heilige Land*), which, like all her other works, has gone through many editions, and been translated into French and English. In 1845, she visited Northern Europe—Sweden, Norway, Lapland, and Iceland—and recorded her impressions in her *Reise nach dem Skandinavisch, Norden und der Insel Island* (2 vols. 1846). But these journeys, which would have satisfied most women, were but little excursions in the eyes of this insatiable nomade, and only served to whet her appetite for something vaster. She resolved on a voyage round the world; and on the 28th of June 1846, sailed from Hamburg in a Danish brig for Brazil. Her descriptions of the scenery of that country and of the inhabitants—both native Indians and Brazilians—are exceedingly interesting. She then sailed round Cape Horn to Chile, and thence, after some time, across the Pacific to Otahite, China, and Calcutta; crossed the Indian peninsula to Bombay, whence she took ship for the Persian Gulf, landed at Bassora, traversed a great part of Western Asia, Southern Russia, and Greece, and re-entered Vienna, November 4, 1848. Two years later, she published a narrative of her travels and adventures, entitled *Eine Frauensfahrt um die Welt* (Vienna, 1850, 3 vols.). As a small recognition

of her services, and of the singular energy, fortitude, and perseverance of her character, the Austrian government granted Madame P. a sum of £100. She now determined to go round the world again, but by a different route. Proceeding to England, she, in May 1851, took ship for Sarawak, rounding the Cape of Good Hope, penetrated alone to the heart of Borneo, visited Java and Sumatra, lived for a time with some cannibal tribes, and sailed from the Moluccas to California, thence to Peru, scaled the peaks of Chimborazo and Cotopaxi, made a run through the principal of the United States, and returned to London in 1854. This second voyage, signalised by several scientific observations, is described in *Meine Zweite Weltreise* (Vien. 1856). But the more she travelled, the fiercer became her hunger for movement. In September 1856, she set out on what was to be her last expedition—namely, to Madagascar. After enduring terrible hardships, she got away, and came home to Vienna—to die. Her death took place October 28, 1858.

PFORZHEIM, an important manufacturing town of the Grand Duchy of Baden, on the northern border of the Black Forest, stands on the Enz, at its confluence with the Nagold and Wurm, 55 miles south-south-east of Mannheim, and on a recently-constructed branch of the Mannheim and Bale Railway. It consists of the town proper—surrounded with a wall and ditch—and the suburbs; contains the remains of an ancient castle, formerly the residence of the Markgrafs of Baden-Durlach; several churches, one of which, the *Schlosskirche*, on a height, contains a number of monuments, with marble statues of the princes of Baden; a convent for noble ladies; industrial and other schools; chemical and iron-works; machine-shops, tanneries, and cloth and other factories. The principal articles of manufacture are gold and silver wares and trinkets, the chief markets for which are Germany and America. An important trade is carried on in timber, which is cut in the neighbouring forests, and is floated down to Holland by the Neckar and Rhine. Pop. (1871) 19,801; (1880) 24,047.

PHÆDRUS, a Latin poet, whose works consist of fables. He was probably a Thracian or Macedonian, carried to Rome as a slave in his childhood, and brought up at the court of Augustus, who emancipated him. Under Tiberius, he was exposed to great danger from the hostility of Sejanus, but lived to see that general's overthrow, and died at an advanced age, probably in the reign of Claudius. Five books of fables, after the manner of *Æsop*, and called *Fabulæ Æsopicae*, have been usually ascribed to him. The faults of the style have led, however, to the suspicion, not merely of alterations at a later date, but of later, and even much later, composition. The dry 'morals' have been supposed to indicate the Middle Ages as the period to which the work should probably be referred; but its authenticity is generally admitted. The first edition was published at Troyes in 1596. The text has subsequently occupied the attention of some of the greatest scholars and critics, from the days of Burmann and Bentley to the present time. A sixth book, containing 32 fables, has recently been discovered and published, of the authenticity of which, however, there are greater doubts than of that of the other books. The best edition is that of J. C. Orelli (Zürich, 1831).

PHÆNOGAMOUS PLANTS. See PHANEROGAMOUS PLANTS.

PHAËTHON (i.e., the shining), in the writings of Homer and Hesiod, a frequent title of Helios the sun-god, and subsequently employed as his name.—P., in Greek mythology, is also the name of a son of

Helios, famous for his unfortunate attempt to drive his father's chariot. Scarcely had the presumptuous youth seized the reins, when the horses, perceiving his weakness, ran off, and approaching too near the Earth, almost set it on fire. Whereupon the Earth cried to Jupiter for help, and Jupiter struck down P. with a thunderbolt into the Eridanus or Po. His sisters, the Heliades, who had harnessed the horses of the Sun, were changed into poplars, and their tears into amber.

PHAËTON. See **TROPIC BIRD**.

PHAGEDÆNA (Gr., from *phagein*, to eat or corrode), designates a variety of ulceration in which there is much infiltration, and at the same time rapid destruction of the affected part. The sore presents an irregular outline, and a yellowish surface; it gives off a profuse bloody or ichorish discharge, and is extremely painful. It usually attacks persons whose constitutions are vitiated by scrofula, by the syphilitic virus, by the abuse of mercury, by intemperance, &c. It not very unfrequently appears in the throat after scarlatina in a severe form. If relief is not afforded by the internal administration of opium (to allay the pain), and of quinia, or some other preparation of bark, wine, beef-tea, &c. to improve the tone of the constitution, together with astringent and sedative local applications, recourse must be had to the destruction of the part by strong nitric acid, or some other caustic.

The terrible disease known in civil practice as **SLOUGHING PHAGEDÆNA**, and in military and naval practice as **HOSPITAL GANGRENE**, is merely, according to some of our highest surgical authorities, a state of phagedæna in its fullest development. This disorder requires for its development the influence of some of those undefined causes which regulate the outbreak of epidemics, and is peculiarly characterised by its contagious and infectious nature. It is usually engendered by the overcrowding of sick and wounded men, and some idea of its virulence may be formed from the fact that on the return of the French fleet from the Crimean war, no less than 60 deaths from it occurred in one ship in the course of 38 hours. It is not of frequent occurrence in the London Hospitals; but it broke out in the Middlesex Hospital in 1835, in University College Hospital in 1844, and in St Bartholomew's and St George's Hospitals in 1847 (Druitt's *Surgeon's Vade-mecum*, 8th ed., p. 72, note). For details respecting this disorder the reader is referred to Hennen's *Principles of Military Surgery*, Boggie *On Hospital Gangrene*, and the article on 'Gangrene,' by Mr Holmes Coote in Holmes's *System of Surgery*, vol. i.

PHALACROCORAX. See **CORMORANT**.

PHALÆNA. See **MOTH**.

PHALANGER or **PHALANGIST** (*Phalangista*), a genus of marsupial quadrupeds, having a rather short head, short ears, short woolly fur, a long prehensile tail, sometimes completely covered with hair, and sometimes only at the base, and acaly towards the extremity; the dentition somewhat various as to the number of premolars, the incisors always six in the upper jaw and two in the lower, the true molars eight in each jaw, the canines of the lower jaw very small, and close to the incisors. The fore-paws are strong, and capable of much use in grasping food and bringing it to the mouth. A number of species inhabit Australia and the islands to the north of it. They live chiefly in trees, and feed on insects, small animals of various kinds, eggs, and fruits. The **SOOTY P.** or **TAPOA** (*P. fuliginosa*) is pretty common in Van Diemen's Land, and is much sought after on account of its fur, which is of a uniform smoky-black colour, or tinged with chestnut, warm and beautiful. The tail

is very bushy. It is nocturnal in its habits.—The **VULPINE P.** (*P. vulpina*), also called the **VULPINE OPOSSUM**, is very plentiful and widely diffused in Australia. The length of the animal from the point of the muzzle to the root of the tail is about 26 inches; the tail is about 15 inches long, and is bushy; the colour is grayish-yellow on the upper

Vulpine Phalanger (*P. vulpina*).

parts, and tawny-buff below. The fur is not so much valued as that of the last species, but is used for various purposes. The flesh, although it has a strong peculiar flavour, is a favourite food of the Australian aborigines.—Nearly allied to this genus, is the genus *Cuscus*, of which one species, whitish-gray, spotted with brown, is plentiful in the Molucca and Papuan Islands.—Allied to the phalangers also are the **Flying Phalangers** (q. v.).

PHALANGIDÆ, a family of Trachearian Arachnida, popularly called *Harvest-men*, some of the species appearing in great numbers in fields during the hay and corn harvests. They resemble spiders in their general form, although their organs of respiration are very different. Their legs are extremely long and slender. Most of the species are very agile.

PHALANSTERIANISM (from Gr. signifying phalanx and solid), the system of living in communities called phalansteries, as suggested by Fourier, the French socialist. See **FOURIERISM**.

PHALANX, the ancient Greek formation for heavy infantry, which won for itself a reputation of invincibility, may be described as a line of parallel columns, rendered by its depth and solidity capable of penetrating any line of troops. The oldest phalanx was the Lacedæmonian or Spartan, in which the soldiers stood eight deep; the Athenian phalanx had been the same, until, at the battle of Marathon, (480 B.C.) Miltiades reduced the depth to four men in order to increase his front. When Epaminondas organised the Theban army against Sparta, he felt that the Spartan line of battle would be impregnable to troops organised in their own manner. He therefore increased the depth and lessened the front of his phalanx, which enabled him to burst through the Spartan line, inflicting the sanguinary defeat of Leuctra (371 B.C.). Philip of Macedon had learned the art of war under Epaminondas, and when he resolved to make his state a military power, he formed the celebrated Macedonian phalanx (359 B.C.), which enabled him to conquer Greece, and with which his son Alexander subdued the eastern world. The Macedonian phalanx, as the latest form that organisation assumed, and as the shape in which the phalanx encountered the

military skill of the west, is deserving of description. The line was 16 deep: a grand-phalanx comprising 16,384 *hoplites*, or heavy-armed soldiers, subdivided as follows: the grand-phalanx was composed of four phalanxes or divisions, each under a general officer, called a *phalangarch*; his command was divided into two brigades or *merarchies* (sometimes called *telarchies*), each of these comprising two regiments, or *chiliarchies*, of four battalions or *syntagmata* each. A *syntagma* answered accurately to a modern battalion, except that it was smaller. It was a perfect square, with 16 men each way, was commanded by a *syntagmatarch* or *xenagos*; and had an adjutant, with one or two other staff-officers who stood behind. Eight files united were under a *taxiarch*, four under a *tetrarch*, corresponding probably to a modern captain, two files were under a *dilochite* or subaltern. A single file of 16 men was called a *lochos*, and the best man was placed at its head; a picked man, the *ouragos*, also marching in the rear. The arms of all these phalanx-men were pikes or spears, 24 feet long, of which 6 feet were behind and 18 feet held in front of the combatant. As each man occupied with his shield three feet, the phalanx, when it advanced, had six tiers of spear-points in front, a wall of steel which no troops could withstand, especially as the bearers of the spears were pressed on by the ten ranks in their rear. By rapid movements the phalanx could change front, form in close column of *syntagmata*, and execute other critical manœuvres. —The heavy-armed phalanx was ordinarily flanked by *peltastes* or light infantry, similarly formed, but only eight deep, while the cavalry were but four deep. The phalanx, as representative of the heavy formation, came in contact with the lighter legion of Rome during the wars of Pyrrhus in Italy. —At the great battle of Heraclea (279 B.C.), the phalanx won the day; but the victory was attributable to other causes as much as to any superiority of formation.

PHALARIS, a tyrant of Agrigentum in Sicily, who flourished about the middle of the 6th c. B.C. According to the prevalent tradition, he was infamous for his cruelty. He maintained his power for 16 years by the aid of foreign hirelings, and, it is said, by putting to death all persons of eminence in his dominions; but at last he fell a victim to popular indignation. He gratified, we are told, his love of cruelty by causing persons to be roasted alive in a brazen bull, which was made for that purpose—the first victim being the maker, Perillus. Cicero calls him the ‘most cruel of all tyrants’ (*crudelissimus omnium tyrannorum*). But some doubt attaches to this view of his character, partly because many of the crimes laid to his charge are intrinsically improbable, and partly because later traditions represent him as fond of literature and philosophy, and a patron of learned men. Lucian affirms that he was naturally a man of a mild and humane disposition. How far the later view should be allowed to modify the earlier, it is—in the absence of all reliable knowledge—impossible to say. It is under the later aspect that he is shewn to us in the famous but spurious *Epistles of Phalaris*. See BENTLEY.

PHALAROPE (*Phalaropus*), a genus of birds of the family *Lopipedidae* (q. v.); having a rather long, slender, weak, straight bill, resembling that of the sandpipers, which, indeed, they otherwise much resemble, although differing in their aquatic habits; the greater part of their time being passed in swimming on the sea, where they seek molluscs and other small marine animals for their food. The GRAY P. (*P. lobatus*), although formerly so rare a bird in Britain that Pennant says he only knew of two instances of its occurrence in his time, is now

not unfrequently seen in its autumn migration from its northern abode to its southern winter-quarters. It breeds in the Arctic regions both of the old and new world, migrating southward in both on the approach of winter. Its entire length is rather more than eight inches. The tail is short. It is a beautiful bird, and remarkable for the great difference of its summer and winter plumage, the prevailing tint in winter being a delicate gray, whilst in summer

Gray Phalarope (*P. lobatus*).

the upper parts exhibit a fine mixture of black, white, and yellow, and the breast and under parts are reddish chestnut.—The RED-NECKED P. (*P. hyperboreus*, or *Lobipes hyperboreus*, a generic distinction being made by Cuvier and others, on account of the sharper and more slender bill), breeds in some of the northern Scottish islands, although it is more common in more northern regions, and, like the former, is found in all the northern parts of the world. It is rather smaller than the Gray P., and is, like it, very graceful in form and movements, and finely coloured. The phalaropes are very fearless of man, and very easily tamed. Their flesh is oily and unpalatable.

PHALLUS, a representation of the male generative organs, used at certain Dionysian festivals in ancient Greece, as a symbol of the powers of procreation. It was an object of common worship throughout the nature-religion of the East, and was called by manifold names, such as *Linga* (q. v.), *Joni*, *Pollear*, &c. Originally, it had no other meaning than the allegorical one of that mysterious union between the male and female, which throughout nature seems to be the sole condition of the continuation of the existence of animated beings; but at a later period, more particularly when ancient Rome had become the hot-bed of all natural and unnatural vices, its worship became an intolerable nuisance, and was put down by the senate on account of the more than usual immorality to which it gave rise. Its origin has given rise to much speculation, but no certainty has been arrived at by investigators. The Phœnicians traced its introduction into their worship to Adonis, the Egyptians to Osiris, the Phrygians to Attys, the Greeks to Dionysus. The common myth concerning it was the story of some god deprived of his powers of generation—an allusion to the sun, which in autumn loses its fructifying influence. The procession in which it was carried about was called *Phallagogia*, or *Periphallia*, and a certain hymn was sung on that occasion, called the *Phallikon Melos*. The bearers of the phallus, which generally consisted of red leather, and was attached to an enormous pole, were the *Phallophoroi*. Phalli were on those occasions worn as ornaments round the neck, or attached to the

body. Aristotle traces the origin of comedy to the ribaldry and the improvised jokes customary on those festivals. Phalli were often attached to statues, and of a prodigious size; sometimes they were even movable. At a procession of Ptolemy Philadelphus, a phallus was carried about made of gold, and 120 yards long. Before the temple of Venus at Hierapolis there stood two phalli, 180 feet high, upon which a priest mounted annually, and remained there in prayer for seven days. The phallus was an attribute of Pan, Priapus, and to a certain extent also of Hermes.

PHALLUS, a genus of fungi of the division *Gasteromycetes*, egg-shaped, the outer covering at length bursting to permit the growth of a stem, the receptacle which produces the spores, and which is surmounted by a rudimentary *pileus*. The most common American species, *P. impudicus* or *fetidus*, popularly called *Stinkhorn*, is as large as a hen's egg, growing underground in thickets, and finally sending up a stem 4—6 inches high, the fetid smell of which is felt for many yards around. The egg is full of a jelly-like substance. The growth of the stem is very rapid, and it soon decays.

PHANERO/GAMOUS (Gr. *phaneros*, manifest; *game*, marriage) **PLANTS**, or **PHENOGAMOUS** (Gr. *phaino*, to shew) **PLANTS**, are those plants which have true flowers, and in which the sexual organs (stamens and pistils) are distinctly notable. They are also called **FLOWERING PLANTS**, being by all these names contradistinguished to **Cryptogamous Plants** (q. v.). The seeds of *P. P.* originate from **Ovules** (q. v.), and already contain the young plant, more or less perfectly formed, which is called the *embryo*. *P. P.* are about three-fourths of all known plants. Among them are included all the larger plants, and all plants of great importance in an economic point of view. They are generally divided into **Monocotyledonous** or **Endogenous Plants**, and **Dicotyledonous** or **Exogenous Plants**.

PHA'RAOH. The name given by the Hebrews to the monarch ruling in Egypt at the time, in the same manner as Cæsar was applied to the Roman emperors, and as Khan is to the Tartar and Shah to the Persian rulers. The word is of uncertain etymology, being capable of two derivations—viz., either *Pa ra*, 'the Sun,' which is the leading or first title of all Egyptian monarchs, or the popular expression, *Pi ouro*, or *Phouro*, 'the King.' It is even possible to derive it from *'Pa har*, 'the Horus,' another title of Egyptian monarchs. The greatest difficulties have been encountered in attempting to determine the particular monarchs who pass under this name in the Scriptures. The first-mentioned *P.* is the one in whose reign Abraham visited Egypt, who is supposed by some chronologists to have been one of the Shepherd Monarchs, but nothing can be offered beyond mere conjecture in support of this theory. Another *P.* is the one in whose reign Joseph was brought to Egypt, and who was supposed by Eusebius to be Apophis, one of the later Shepherd Kings of the seventeenth dynasty, who are known from the monuments to have immediately preceded the eighteenth. Bunsen indeed places the arrival of Joseph in the reign of Useratesen, or, as he reads his name, Sesertesen I. of the 12th dynasty, in which indeed a famine is stated in the hieroglyphical texts to have happened, and in which it appears numerous officers were established to take charge of the grain. Arguments, however, may be adduced for Joseph having arrived in the time of the 12th dynasty, from the fact of the establishment of the family of Jacob in the land of Goshen, the importance to which Joseph had risen, and the omission of the name of any of the

principal Egyptian cities in the narrative, and the fact of Joseph having married Asenath, the daughter of Potipherah, priest of Heliopolis, a city evidently the seat of the court under the 12th dynasty, as Ouar or Avaris was under the Shepherds. Equal difficulty is experienced in determining the *P.* who reduced the Israelites to bondage, employed them in the labours of the brick-field, and compelled them to build the treasure-cities of Pithom and Rameses. He appears to have meditated the total absorption of the Hebrews into the Egyptian race. All that is clear from the narrative is that the city of Rameses was called after his name, in the same manner as modern forts have been by contemporary rulers. Now frequent mention occurs in the Papyri and other texts of the *Makatalu en Ramessu*, or Tower of Rameses II., which is represented on the walls of Medinat-Abu; and this has induced Lepsius and Bunsen to depress the date of the Exodus from 1491 B. C. to the close of the nineteenth dynasty, or after Rameses II., a point controverted by other chronologists, who wish to elevate it to the middle of the 18th dynasty, or 1732 B. C. To synchronise the former date, Lepsius takes the rabbinical date of 1314 B. C. for the Exodus, or 1340 B. C. for the birth of Moses. The *P.* of the Exodus is supposed to be Meriemptah or Menephthas, the son and successor of Rameses II. Philologically, this explanation is preferable, as the fixed point in the inquiry is the name of the Migdol of Rameses found both in the Scriptures and on the monuments of Egypt. Other Pharaohs are mentioned; as the father of Tahpenes, wife of Hadad and mother of Genuboth; the *P.* whose daughter Solomon married; *P.* Necho, or Necho II., who gave battle to Josiah, king of Judah, whom he slew at Megiddo, and who made war against the Syrians, defeated them at Magdolus, and took Cadytus or *Katsh*, on the *Arunata* or Orontes. He was subsequently defeated by Nebuchadnezzar at Carchemish, 607 B. C. *P.* Hophra, was the Uaphris or Apries of the Greeks whose destruction was prophesied by Jeremiah, and who was strangled 570 B. C.—Bunsen, *Egyptens Stelle*, iii. p. 109; Lepsius, *Einleit.* p. 317; Nash, *The Pharaoh of the Exodus* (8vo, Lond. 1862).

PHARISEES (*Perishim* or *Perushim*, Separatists), a so-called 'Jewish sect,' more correctly, however, a certain Jewish school, which probably dates as a distinct body or party from the time of the Syrian troubles, and whose chief tendency it was to resist all foreign, chiefly Greek, influences that threatened to undermine the sacred religion of their fathers. They most emphatically took their stand upon the Law, together with those inferences drawn from its written letter which had, partly from time immemorial, been current as a sacred tradition among the people. Out of the small band of the Chasidim (q. v.), the *P.* had taken their rise originally as *Chaberim*, Friends, Colleagues, Scholars—in contradistinction to the *Am-Haarez*, or common people—and their chief object in life was the Divine Law, its study and further development. Principally distinguished by their most scrupulous observance of certain ordinances relating to things clean and unclean, they further adopted among themselves various degrees of purity, the highest of which, however, was scarcely ever reached by any member of their community. For every degree, a special course of instruction, a solemn initiation, and a novitiate was necessary; all of which, together with a certain distinction in dress, seems to have been imitated from them by the Essenes (q. v.). The name of *P.* or *Perushim* was probably at first bestowed upon them in derision by the Sadducees or Zadokites, the priestly aristocracy and their party, the Patricians, who differed from them politically,

and to some extent also in religious matters. The P. had no special 'Confession of Faith,' or articles of creed different from the whole body of Jews. The Bible, as interpreted by the traditional Law, was their only code. Obedience to this Law, strictest observance of all religious and moral duties, submission to the Divine will, full confidence in the wisdom and justice of Providence, firm belief in future reward and punishment, chastity, meekness, and forbearance—these were the doctrines inculcated in their schools. They were, in fact, nothing more or less than the educated part of the people, who saw in the rigid adherence to the ancient religion, such as it had developed itself in the course of centuries, the only means of saving and preserving the commonwealth, notwithstanding all its internal and external troubles. Hence, they wished the public affairs, the state and all its political doings, to be directed and measured by the standard of this same Divine Law; without any regard for those aristocratic families who ruled, or at all events greatly influenced the commonwealth. These consisted of the priestly families, the Zadokites (Saducees, q. v.), and of the valiant heroes and sagacious statesmen, who had brought the Syrian wars to a successful issue, and had, by prudent negotiations with other courts, restored the nation to its former greatness, and, on their own part, had acquired wealth and fame, and freer and wider views of life and religion. The latter held the modern doctrine, that religion and state were two totally different things; that God had given man the power of taking his matters into his own hands; and that it was foolish to wait for a supernatural interference, where energy and will were all that was required. Naturally enough, the political difference between the two parties by degrees grew into a religious one, since the Jewish State was one still completely pervaded by the religious element—as indeed it had begun as a theocracy, and could still, to a certain extent, be called by that name. And the more the Sadducees lost their influence—the people siding with the P.—the more the religious gulf must have widened between them; although the divergence between them, as far as our authorities—Josephus, the New Testament, and the Talmud—go, does not seem to have been of a very grave nature. Thus, the P. assumed the dogma of immortality, chiefly with a view to a future reward of good and evil deeds in this world; while the Sadducees, without rejecting—as we are erroneously informed by Josephus—this dogma in the least, yet held that there was nothing in the Scripture to warrant it, and, above all, that there was no need of any future reward; at any rate, that a pious life with a view to this was not meritorious. While the P. held all the traditional ordinances in equal reverence with the Mosaic ones, tracing, in fact, most of the former to Sinai itself, the Sadducees rejected, or rather varied some of these according to the traditions of their own families: these ordinances chiefly relating to priestly and sacrificial observances, certain laws of purity, and some parts of the civil law. It may perhaps even be assumed, with the most recent investigators (chiefly Geiger), that the P. were the representatives of a newer Halacha, dictated by an oppositional and religious and national zeal which carried them far beyond the original boundaries. Certain other legal differences between the two parties, such as the application of the laws of inheritance to daughters, or of the responsibility of the master for his servants, are nothing more than political party-views in a religious mask, which were meant to meet certain special isolated cases only. In general, the P. handled justice in a

much milder manner than their antagonists, who took their stand upon the rigid letter, and would hear of no mercy where a violation of the code was clearly made out. Out of the midst of the P. rose the great doctors and masters of the Law (*Soferim*, Scribes, *Nomodaskaloti*, teachers of the Law), and to them were intrusted by the later rulers the most important offices.

Until recently, the greatest misconception has prevailed even among scholars respecting this self-sacrificing, patriotic, pious, learned, and national party of progress. That there were among them those who were a disgrace to any party, and, still more, to their strict one, no one knew better than the P. themselves, and in bitterer words than were ever used by Christ and the apostles, the Talmud castigates certain hyperpious members of their own community as the 'plague of Pharisaism.' These hypocrites were characteristically styled *Zebuim* [dyed, painted ones], 'who do evil deeds like Zimri, and require a godly reward like Phinehas.' Seven kinds of P. are enumerated in the Talmud, six of whom were not to be counted as real Pharisees—viz. (1) they who did the will of God for earthly motives; (2) those who made very small steps, or said: Wait for me—I have still some good deed to do; (3) those who knocked their heads against walls, lest they might look at a woman; (4) *ex officio* Saints; (5) those who say: tell me of another duty; (6) those who are pious, because they fear God. The only genuine Pharisee was he 'who did the will of his Father in Heaven, because he loved Him.' Josephus's accounts, distortions in themselves, have, to add to the confusion, been misunderstood (thus, for example, the word which he uses to designate the three parties, never meant 'sect,' as it has invariably been interpreted); and the position of Christ, in relation to the P., can never be understood properly without a full acquaintance with the circumstances of the time, to which there is no other way than a knowledge of that literature (the Talmud and Midrash) which has so long been neglected. Christ found the influence of the P. predominant among the people, although the Sadducees (and the Boethusians) were in reality the ruling classes and allies of the reigning dynasty. He naturally sided with the democratic party of the P. against that of the proud opposite camp. As for the religious tendencies of the latter, the Sadducees (q. v.)—the people had decided that point already practically, by siding with the Pharisees. Once only an allusion is made also to the heaven of Herod = the Sadducees (Mark viii. 15, cf. Matt. xvi. 6). But it was, above all things, necessary to combat the ever-growing tendency to choke up, as it were, all real piety and genuine virtue of heart under external ceremonies and observances, which, unless guarded against, will appear, instead of a mere symbol and memento, the essence of religion itself, and thus become in time a delusion and bondage, and end in that vile hypocrisy, against which the Talmud fights with all its powers of derision, and Christ inveighs in much more vehement terms than is his wont. It was not in themselves that these 'oral laws' were held up to scorn. They were a necessary and natural growth, and acted, in the main, beneficially; as is now fully recognised by scholars of eminence. (For some further remarks on the subject, see TALMUD.)

Pharisaism—from which gradually branched off the wild democratical party of *Zealots* (Kannaim), and which for the last time represented political opinions in the revolution of Bar Cochba—has, from the downfall of the sanctuary, and the final destruction of the commonwealth, to this day, remained the

principal representative of Judaism as a creed only, Sadduceism dying out, or, at all events, producing only one such sterile plant as Karaism. See JEWISH SECTS, SADDUCEES.

PHARMACOPŒIA. This term has been applied to various works, consisting for the most part of (1) a list of the articles of the *Materia Medica*, whether simple or compound, with their characters, and the tests for the determination of their purity; and (2) a collection of approved receipts or prescriptions, together with the processes for articles in the *Materia Medica*, obtained by chemical operations. Almost every civilised country of importance has its national pharmacopœia, amongst which those of the United States, France, and Prussia deserve specially honourable notice. The first pharmacopœia published under authority appears to have been that of Nuremberg, in the year 1542. Before this time, the books chiefly in use amongst apothecaries were the treatises: *On Simples* by Avicenna and Serapion; the *Liber Servitoris* of Balchasin ben Aberazerim; the *Antidotarium* of Johannes Damascenus or Mezue, arranged in classes; and the *Antidotarium* of Nicolaus de Salerno, which was commonly called *Nicolaus Magnus*, to distinguish it from an abridgment known as *Nicolaus Parvus*.

As regards the British Pharmacopœias, we may notice that the first edition of the London Pharmacopœia (or, more correctly speaking, of the Pharmacopœia of the London College of Physicians) appeared in 1618, and was chiefly founded on the works of Mezue and Nicolaus de Salerno. Successive editions appeared in 1627, 1635, 1650, 1697, 1721, 1746, 1787, 1809, 1824, 1836, and 1851; and form an important contribution to the history of the progress of pharmacy and therapeutics during the last two centuries and a half. The nature and the number of the ingredients that entered into the composition of many of the pharmaceutical preparations of the 17th and 18th centuries would astonish most of the practitioners and patients of the present day. In the earlier editions we find enumerated earth-worms, snails, wood-lice, frogs, toads, puppy dogs, foxes ('a fat fox of middle age, if you can get such a one'), the skull of a man who had been hanged, the blood of the cat, the urine and excrements of various animals, &c.; and electuaries were ordered, containing 50, 62, and in one instance—Mathiolus his Great Antidote against Poison and Pestilence—124 different ingredients.

The Edinburgh Pharmacopœia is more modern than the London, the first edition having appeared in 1699; while the Dublin Pharmacopœia does not date further back than 1807.

Until the Medical Act passed in 1858, the right of publishing the pharmacopœias for England, Scotland, and Ireland was vested in the Colleges of Physicians of London, Edinburgh, and Dublin respectively; and as these three pharmacopœias contained many important preparations, similar in name but totally different in strength (as, for example, dilute hydrocyanic acid, solution of hydrochlorate of morphia, &c.), dangerous complications arose from a London prescription being made up in Edinburgh or Dublin, or *vice versâ*. By that act it is ordained that 'the General [Medical] Council shall cause to be published, under their direction, a book containing a list of medicines and compounds, and the manner of preparing them, together with the true weights and measures by which they are to be prepared and mixed; and containing such other matter and things relating thereto as the General Council shall think fit, to be called *British Pharmacopœia*, which shall for all purposes be deemed to be substituted throughout *Great Britain and Ireland*, for the several above-mentioned pharmacopœias.'

In the United States, the Massachusetts Medical Society published a Pharmacopœia in 1808, and the New York Hospital issued one in 1816; but through-

out the United States the practice of Pharmacy was exceedingly unsettled, and a National Pharmacopœia remained a great desideratum. Accordingly, on January 1, 1820, a general medical convention, composed of delegates from incorporated and unincorporated medical societies throughout the United States, assembled at Washington, and appointed a committee of five to prepare the Pharmacopœia agreed upon by the convention. The volume was published in 1820, and a second edition in 1828; subsequently, arrangements were made for decennial revisions of the work. The committee of 1840, before publishing their revision, solicited the co-operation of the Colleges of Pharmacy of Boston, New York, and Philadelphia; and in the call for the convention to meet in 1850, the incorporated Colleges of Pharmacy, and medical colleges and societies, were invited to send delegates; and in this, as in the subsequent revisions, essential service has been rendered to the committee by the labours of the Colleges of Pharmacy. The revision of 1830 was published in 1831; that of 1840 in 1842; that of 1850 in 1851; that of 1860 in 1863; and that of 1870 in 1873. See PHARMACOPŒIA, in Supplement, in Vol. X.

PHARMACY (from the Gr. *pharmakon*, a medicine) is that department of *Materia Medica* (q. v.) which treats of the collection, preparation, preservation, and dispensing of medicines. It is synonymous with *Pharmaceutical Chemistry*.

PHAROS. See LIGHT-HOUSE.

PHARSA'LUS, now FERSALA, anciently a town of Thessaly, to the south of Larissa, on the river Enipeus, a branch of the Peneus (now the Salambría), and historically notable mainly for the great battle fought here between Cæsar and Pompey, August 9, 48 B. C. Pompey had about 45,000 legionaries, 7000 cavalry, and a great number of light-armed auxiliaries. Cæsar had 22,000 legionaries and 1000 German and Gallic cavalry. The battle-cry of Cæsar's army was '*Venus victrix*,' that of Pompey's '*Hercules invictus*.' Cæsar's right wing began the battle by an attack on the left wing of Pompey, which was speedily routed; Pompey fled into the camp, and his army broke up; Cæsar's troop stormed his camp about mid-day, and he himself, awaking as from stupefaction, fled to Larissa, whither Cæsar followed him next day. Cæsar, according to his own account, lost only 30 centurions and 200 soldiers; other accounts make his loss 1200. On Pompey's side about 6000 legionaries fell in battle, and more than 24,000, who had fled, were taken, whom Cæsar pardoned, and distributed among his troops.

PHARYNGOBRA'NCHII, a sub-order of Lepto cardian fishes, characterised by respiratory processes projecting from above the pharynx into the large cavity of the mouth. The P. have a tubular heart, and are the lowest in organisation of all fishes. The species are very few. See LANCELET.

PHARYNGOGNA'THII, a group of perciform fishes, in the system of Müller and Owen; partly *Acanthopterous* and partly *Malacopterous* in the system of Cuvier; some of them also *Cycloid*, and some *Ctenoid*. In Cope's system the latter only are included under this name, and are a subdivision of the perciform order. Their common characteristic is the union of the lower pharyngeals into one bone.

PHARYNX (Gr.) is the name of that part of the alimentary canal which lies behind the nose, mouth, and larynx. It is a musculo-membranous sac, situated upon the cervical portion of the vertebral column, and extending from the base of the skull to the level of the fifth cervical vertebra, where it becomes continuous with the Oesophagus (q. v.). Its length is about four inches and a half, it is broader in its transverse than in its antero-

posterior diameter, and its narrowest point is at its termination in the œsophagus. Seven foramina or openings communicate with it—viz, the two

Fig. 1.—The Pharynx laid open from behind :

1, a section of the base of the skull; 2, 2, the walls of the pharynx drawn to either side; 3, 3, the posterior nares, separated by the vomer; 4, 4, the extremities of the Eustachian tubes; 5, the soft palate; 6, 6, 7, 7, its posterior and anterior pillars; 8, the root of the tongue; 9, the epiglottis overhanging; 10, the opening of the larynx; 11, the posterior part of the larynx; 12, the opening into the œsophagus, whose external surface is seen at 13; 14, the trachea.—(From Wilson.)

posterior nares or nostrils, at the upper and front part of the P.; the two *Eustachian tubes*, opening on the outer surface of the preceding orifices; the *mouth*; the *larynx*; and the *œsophagus*.

The P. is composed of an external muscular coat;

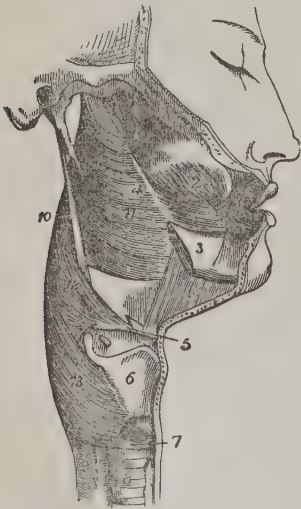

Fig. 2.—External View of the Muscles of Pharynx :

1, the orbicularis oris muscle; 2, the Buccinator muscle; 3, portion of lower jaw, part of which is cut away; 4, pterygo-maxillary ligament; 5, the hyoid bone; 6, the thyroid cartilage; 7, the bicoid cartilage; 8, the trachea; 9, the œsophagus, with the recurrent laryngeal nerve lying between it and the trachea; 10, the stylo-pharyngeus muscle; 11, 12, 13, the superior, middle, and inferior constrictor muscles.

a middle fibrous coat called the *pharyngeal aponeurosis*, thick above where the muscular coat is absent, and gradually thinning as it descends;

and a *mucous* coat, continuous with the mucous membrane of the mouth and nostrils. The muscular coat requires special notice. It is composed of a *superior*, *middle*, and *inferior constrictor* muscle on either side, together with two less important muscles, termed the *stylo-pharyngeal* and *palato-pharyngeal* muscles. When the food, after being sufficiently masticated and mixed with saliva, is thrown, by the action of the tongue, into the P., the latter is drawn upwards and dilated in different directions; the elevator muscles (the *stylo-pharyngeal* and *palato-pharyngeal*) then relax, and the P. descends; and as soon as the morsel is fairly within the sphere of action of the constrictor muscles, they successively contract upon it, and gradually pass it onwards to the œsophagus. Independently of its importance in the act of swallowing, the P. exerts an influence on the modulation of the voice, especially in the production of the higher notes.

The P. is not so frequent a seat of disease as many other parts of the intestinal tube. In cases of Diphtheria (q. v.) it is usually the chief seat of the disease. It is liable to ordinary inflammation or *pharyngitis*—an affection characterised by pain, especially in swallowing, without redness in the fauces or change of voice. Little in the way of treatment, except low diet and attention to the bowels, is required; and the inflammation usually terminates in resolution. Sometimes, however, it proceeds to suppuration, and abscesses—dangerous partly from inanition consequent on inability to take food, but chiefly from suffocation due to pressure on the larynx—are formed. These abscesses are more dangerous in the lower than in the upper part of the P., and are more common in young children than in adults. The treatment consists in opening the abscess, which gives immediate relief; but the operation must be conducted with great care, and the incision made as nearly as possible to the mesial line, in consequence of the large adjacent blood-vessels.

PHASCO'GALÉ, a genus of marsupial quadrupeds, of which one species, *P. penicillata*, about the size of a rat, gray, with long soft hair, and a long tufted tail, is common in most parts of Australia, lives chiefly in the hollows of decayed trees, and preys on small animals of every kind. It is much disliked by the colonists, to whom it is known as the *Tapoa Tafa*, on account of its depredations in poultry-yards and larders. It is very agile and audacious.

PHASE'OLUS. See KIDNEY-BEAN.

PHA'SES (Gr. *phasis*, appearance), the different luminous appearances presented by the moon and several of the planets, sometimes the whole, a part, or none, of the luminous surface being seen from the earth. The various phases of the moon, and the reasons of them, are mentioned under the article **MOON**. Mercury and Venus, being inferior planets, present to an observer on the earth exactly similar phases to those of the moon; but the former require, instead of a month, periods of 116 and 584 days respectively to pass through a complete series of phases. The superior planets, to a certain extent, exhibit phases, but the luminous surface, as seen from the earth, only varies from the full illumination seen when they are in conjunction with the earth to a slightly gibbous appearance when they attain their greatest elongation; and their distance from the sun is so great in comparison with that of the earth, as to render the variation in the form of their luminous surface not observable, except in the case of Mars and occasionally of Jupiter. Galileo was the first to observe the phases of Venus, and he considered them as one of the most satisfactory proofs

of the truth of the Copernican system. The great brilliancy of Mercury, and its nearness to the sun, prevented its phases from being so easily noticed, but they were at last observed by Masius, and since by many other astronomers. The term phases is frequently applied to designate the successive stages of an eclipse, lunar or solar.

PHASIANIDÆ, a family of gallinaceous birds, including pheasants, argus, Macartney cock, fowls, impeyans, tragopans, &c.; its limits, however, being extended by some ornithologists to include peacocks and turkeys (*Pavonidæ*), which differ from it by no very considerable character. The hind-toe is placed higher on the tarsus than the front toes, so that only the tip touches the ground. The wings are short.

PHASIS, a river in Colchis, now called the Rion. It rises in the mountains of Caucasus, flows in a generally western direction, and enters the Euxine near the ancient city of Phasis.

PHASMODÆ (Gr. *phasma*, a spectre), a family of orthopterous insects, allied to *Mantidæ*, but differing in having the fore-legs similar to the other legs, and used like them for locomotion, not for combat and prehension, in the want of stigmatic eyes, and in the similarity of the first joint of the thorax to the other joints. They are insects of very extraordinary appearance, inhabiting tropical countries, and spending their lives upon trees and shrubs, the tender shoots of which they devour. Some of them resemble green leaves; some resemble brown and withered leaves; whilst others, wingless, or nearly so, and with much elongated bodies—one species nine inches in length—resemble dried twigs. To these peculiarities they owe their safety from enemies, eluding observation, for their motions are sluggish. Some are known as Leaf Insects, Spectre Insects, Walking-sticks, &c. The larvæ of the P. much resemble the perfect insect.

PHEASANT (*Phasianus*), a genus of gallinaceous birds of the family *Phasianidæ*; having a rather short strong bill, a little curved; the cheeks and skin surrounding the eyes destitute of feathers, and warty; the wings short; the tail long, its feathers so placed as to slope down, roof-like, on either side, the middle feathers longest; the tarsus of the male furnished with a spur. The males of all the species are birds of splendid plumage; the females have shorter tails and dull or sombre colours. There are numerous species, natives of the warm and temperate parts of Asia. The Common P. (*P. Colchicus*) is said to have been brought from the banks of the Phasis, in Colchis, to the south of Europe, at a very remote period, its introduction being ascribed in classic legends to the Argonauts. From the Phasis it derived its Greek name *Phasianos*, the origin of its name in English and other modern languages. It was soon naturalised in Europe, and is now diffused over almost all the temperate parts of it. The date of its introduction into Britain is not known, but was certainly before the end of the 13th c.: it has long been plentiful in plantations and game-preserves, and has been introduced into almost every part of the country suitable to its habits. The abundance of pheasants in Britain, however, is to be ascribed chiefly to careful game-preservation, without which the race would in all probability soon be extirpated. No kind of game falls so easy a prey to the poacher.

A minute description of the Common P. is unnecessary. The head and neck of the male are steel-blue, reflecting brown, green, and purple in different lights; the back and wings exhibit a fine mixture of orange-red, black, brown, and light yellow; the breast and belly are golden-red, each feather

marginated with black, and reflecting tints of gold and purple. The whole length of a male P. is about three feet, of which the tail often measures two feet. The entire length of the female is about two feet. The general colour of the female is pale yellowish-brown, varied with darker brown, the sides of the neck tinged with red and green. The ordinary weight of a P. is about two pounds and a half; but when pheasants are abundantly supplied with food, and kept undisturbed, they are sometimes four pounds or four pounds and a half in weight.

The nest of the P. is on the ground, and is a rude heap of leaves and grasses, in which eleven or twelve olive-brown eggs are laid. But in the half-domesticated state in which it exists in many English preserves, the P. does not pay that attention to its eggs and young which it does when more wild, and not unfrequently continues to lay eggs for a considerable time, like the domestic fowl; the eggs being removed by the gamekeeper, and hatched by hens, along with eggs from nests found among clover and hay in the season of mowing. Very young pheasants must be carefully supplied with ant-eggs, maggots, &c., and the whole difficulty of rearing them is in their earliest stage. Pheasants feed very indiscriminately on berries, seeds, roots, young shoots of plants, worms, insects, &c. Beans, pease, corn, and buckwheat are not unfrequently sown for them in open places in woods; and they scrape up bulbous and tuberous roots in winter. They roost in trees at no great height from the ground, and poachers sometimes capture them by burning sulphur below them. During the moulting season, they do not ascend trees to roost, but spend the night on the ground, when they fall a ready prey to foxes. They are fond of woods with a thick undergrowth, in which, when disturbed, they naturally seek shelter, running whilst it is possible, rather than taking flight. The male P. takes flight much more readily than the female, which, apparently trusting to her brown colour to escape observation, often remains still until the sportsman is almost upon her. The males and females do not associate together except during the breeding season, but small numbers of one sex are often found in company. The 'short crow' of the males begins to be heard in March. In England and Scotland pheasant-shooting legally begins on the 1st of October, and ends on the 3d of February. The pheasants turned out from the gamekeeper's breeding-yard into a preserve, are in general supplied with abundance of food during winter, and come to the accustomed call as readily as any kind of poultry, so that the sportsmanship of a *batue*, in which they are killed by scores or hundreds, is of the lowest kind. It is scarcely necessary to mention that the flesh of the P. is in very high esteem for the table.

The female P., in old age, or when from any cause incapable of the functions of reproduction, sometimes assumes the plumage of the male. The P. exhibits a remarkable readiness to hybridise with other gallinaceous birds. A hybrid between it and the common fowl is not unfrequent, and is called a *Pero*. Hybrids between the P. and Black Grouse have also occurred; and hybrids are supposed to have been produced between the P. and Guinea-fowl, and the P. and turkey. None of these hybrids, however, have ever been known to be fertile, except with one of the original species. On the contrary, the offspring of the Common P. and the RING-NECKED P. (*P. torquatus*) is perfectly fertile, a circumstance which is urged in argument by those who regard them as mere varieties of one species. The Ring-necked P. is now almost as plentiful in Britain as the Common P.: it is a native

of the forests of India and China, and is said not to breed with the Common P. in a truly wild state, but in Britain they readily intermix. It is distinguished by a white ring almost surrounding the neck, and is of smaller size than the Common P., somewhat different in markings, and has a shorter tail.—The BOHEMIAN P. is another variety of a silvery-gray colour.—White pheasants are of not very unfrequent occurrence.—Of other species of P. may be mentioned DIARD'S P. (*P. versicolor*), a native of Java, in which the prevailing colour is green; and REEVES'S P. (*P. Reevesii*), a native of the north of China, in which white is the prevailing colour, and the tail is of extraordinary length, so that a bird not larger than the Common P. measures eight feet in entire length. Of somewhat different type, and more nearly approaching to the common fowl, are the GOLDEN P. (*P. pictus*, or *Thaumalia picta*) and the SILVER P. (*P.* or *Gallopasis nythemerus*), the natives of China, and both hardy birds, the introduction of which into British preserves has been attempted with good prospect of success. Both have long been kept in a state of domestication by the Chinese. The Golden P. is one of the most splendid of the tribe. It has a fine crest, and a ruff of orange and black, capable of being erected at pleasure. The tail is very long. The crest and ruff are held in great estimation by anglers for making artificial flies.—LADY AMHERST'S P. (*P.* or *Thaumalia Amherstiae*) is a native of China, resembling the Golden P., and with an extremely long tail.—The Silver P. is one of the largest and most powerful of the tribe, and very combative, driving the Common P. from preserves into which it is introduced. The prevailing colour of the upper parts and tail of the male is white, finely pencilled with black, the breast and belly purplish-black.—The name P. is sometimes extended to gallinaceous birds of allied genera.

PHEASANT-SHELL (*Phasianella*), a genus of gasteropodous mollusc of the family *Turbinidae*, of which the shells are much valued for their beauty, and when they were rare in collections, were sometimes sold for extraordinary prices. They are now comparatively cheap and plentiful, being found in great numbers on some parts of the Australian coast.

PHEIDIAS (Lat. *Phidias*), son of Charmides, the greatest sculptor of ancient Greece, born at Athens probably between 500–490 B.C. His first instructor in art was Hegias of Athens; he afterwards studied under a more famous master, Ageladas of Argos. He appears to have first acquired distinction in his profession soon after the battle of Salamis, and indeed his great works were all executed during a period most favourable for the development and encouragement of genius, when Greece was triumphant over external enemies, and her people enjoyed a more perfect liberty than almost at any other period of their history. With the character of the age correspond the works of its poets, particularly of the tragedians Æschylus, Sophocles, and Euripides, and of its sculptors, particularly of Pheidias. Under Cimon's administration the Athenians began the work of restoring their city, which the Persians had destroyed, in more than its former magnificence, and to fill it with noble works of art. P. was accordingly employed in making the colossal brazen statue of Minerva, *Athena Promachos*, which was placed upon the citadel, and was executed probably about 460 B.C. To the government of Cimon succeeded that of Pericles, still more brilliant, and signalled by an extraordinary development of art. Pericles not only gave to P. a commission to execute all the

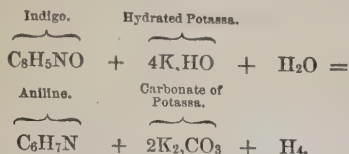

more splendid statues that were to be erected, but made him general superintendent of all works of art going on in the city. Plutarch tells us that P. had under him architects, statuaries, workers in copper and bronze, stone-cutters, gold and ivory beaters, &c. To P., as director-general of all the skilled artists and artificers of Athens, we owe, among other glorious edifices, the Propylæa and the Parthenon, the sculptured ornaments of which were executed under his direct superintendence, while the statue of the goddess Athena, the materials for which were ivory and gold, was the work of P. himself (circa 438 B.C.). This statue was clothed with a golden robe, which alone was worth 44 talents of gold. The statue is gone for ever, and the Parthenon is now only a magnificent wreck, but we still possess some splendid evidence of the genius of P., in the sculptures of the metopes, and friezes of the temple of Athena. See ELGIN MARBLES. Next year P. went to Elis, where he executed a colossal statue of Zeus for the Olympeum at Olympia (q. v.), also of ivory and gold (about 433 B.C.). This was reckoned his masterpiece. On his return to Athens, political passions were running high. There was a strong—at least a violent—party inimical to Pericles, but as they did not dare to attack the great statesman, they assailed him through his friends P., Anaxagoras, Aspasia, &c. P. was accused of having appropriated to himself some portion of the gold destined for the robe of Athena. This accusation he repelled by taking off the robe and weighing it. He was then accused of impiety, for having introduced his own likeness and that of Pericles on the shield of the goddess. On this most frivolous and contemptible pretext he was thrown into prison, and died there, but whether of sickness or poison is uncertain. His death took place about 432 B.C. The works executed by, or ascribed to P., were numerous, but we have mentioned the most celebrated. Their prevailing characteristic appears to have been an ideal sublimity, and even the imperfect relics that we possess are the most noble specimens of sculpture in the world.

PHENOMENON (Gr. appearance), the name given in philosophy to an object or fact as it is perceived by us, as distinguished from what it is in itself. In the philosophy of Kant, that, whatever it may be, which is behind the phenomenon, and causes it, is called the *noumenon*, as being merely assumed or thought of in the mind. See METAPHYSICS, PERCEPTION.

PHENYL (C_6H_5) is an organic radical, which has been obtained in the free state by several processes. Its most important compounds are: (1.) Carbolic or Phenic acid (C_6H_5O), known also as Phenol, Hydrate of Phenyl, and Phenyl-Alcohol. See CARBOLIC ACID. (2.) Hydride of Phenyl (C_6H_6), known also as Benzole, Benzene, and Phene. See BENZOLE. (3.) Mono-phenylamine, Phenylamine (C_6H_7N), better known under the name of Aniline, one of the most important of the artificially-formed bases; and Tri-nitro-phenic, or Picric acid ($C_6H_3N_3O_7$).

Aniline derives its name from *anil*, an obsolete name for indigo, which is one of the sources from which it is most readily procured. It exists amongst the products of the distillation of coal, and probably other organic compounds, but is always obtained by the manufacturing chemist either from indigo or from nitro-benzole. Dr Hofmann, to whom we are mainly indebted for our knowledge of the chemistry of this substance, gives the following directions for obtaining it from indigo: 'Powdered indigo boiled with a highly-concentrated solution of hydrate of potassa, dissolves with evolution of hydrogen gas

to a brownish-red liquid, containing a peculiar acid, called the *anthranilic acid*. If this matter be transferred to a retort, and still further heated, it swells up, and disengages aniline, which condenses in the form of oily drops in the neck of the retort and in the receiver. Separated from the ammoniacal water by which it is accompanied, and re-distilled, it is obtained nearly colourless. The formation of aniline from indigo is represented by the following equation:

By this process, the indigo is made to yield about one-fifth of its weight of pure aniline. Nitro-benzole is converted into aniline by the action of various reducing agents, such as hydrosulphate of ammonia, or acetate of protoxide of iron; and the distillation of one part of nitro-benzole, one part of acetic acid, and one and a half parts of iron filings, is regarded by Hofmann as the best means of preparing aniline, which is now required in large quantities for the dyers.

'When pure,' says Dr Hofmann, 'aniline forms a thin, oily, colourless liquid, of faint vinous odour, and aromatic burning taste. It is very volatile, but has nevertheless a high boiling-point, 359°6. In the air, it gradually becomes yellow or brown, and acquires a resinous consistency. Its density is 1.023. It is destitute of alkaline re-action on test-paper, but is remarkable for the number and beauty of the crystallisable compounds it forms with acids. Two extraordinary re-actions characterise this body, and distinguish it from all others—viz., that with chromic acid, and that with solution of hypochlorite of lime. The former gives with aniline a deep-greenish or bluish-black precipitate; and the latter, an extremely beautiful violet-coloured compound, the fine tint of which is, however, very soon destroyed.' In the manufacture of aniline on a large scale, several bases having higher boiling-points than aniline are formed. To one of these—a beautiful crystalline compound, represented by the formula $\text{C}_{12}\text{H}_{14}\text{N}_2$ —the name of *Paramiline* has been given, from its being isomeric with aniline. Aniline is a substance of the greatest importance in theoretical organic chemistry, from the large number of derivatives and substitution-products which it yields, and for the knowledge of which we are almost entirely indebted to Hofmann, whose investigations originally appeared in a series of papers in the *Transactions of the Philosophical Society*. These compounds are, however, for the most part of too complicated a nature to be noticed in these pages. But, independently of its theoretical importance, this substance has recently been extensively employed in the arts, a series of pigments of unequalled beauty having been obtained from it by the action of oxidising agents. It is to Mr W. Perkin that we are indebted for the idea of applying practically the property possessed by aniline of forming violet and blue solutions with chromic acid and with hypochloride of lime, to which we have already referred; and he succeeded in fixing these colours, and adapting them to the use of the dyer. See *DYE-STUFFS*; also *Utilisation of the Waste Products of Coal Gas*, by Dr Letheby, in *Th. Chemical News*, 1867.

(4.) Trinitro-phenic Acid ($\text{C}_6\text{H}_3\text{N}_3\text{O}_7$), in which three of the equivalents of the hydrogen of phenic acid are replaced by three equivalents of the group, NO_2 , known also as Carbazotic Acid (q. v.), and Picric Acid. In addition to the remarks

contained in the article on CARBAZOTIC ACID, it may be noticed that while a solution of this acid communicates a bright-yellow tint to animal textures, as the skin, wool, and silk, it has no such effect on tissues composed of vegetable fibres, such as cotton and linen, and hence it may be employed to ascertain whether the materials of any tissue belong to the animal or to the vegetable kingdom. A solution of a salt of this acid, when treated with indigo, yields a beautiful green colour, which is employed in the manufacture of artificial flowers, and for various other purposes. In doses of from 1 to 10 grains, it acts on rabbits as a strong poison, occasioning convulsions and speedy death. It has been prescribed in small doses, with moderate success, in cases of intermittent fever; but patients to whom it is given should be previously informed that it possesses the property of giving to the eye a yellow and, as it were, a jaundiced appearance. All the salts of this acid are of a beautiful red or yellow tint, and most of them form brilliant crystals. When heated, or in some cases when only struck they explode with considerable violence.

PHE'ON, in Heraldry, the barbed head of a dart. It is represented as engraved on the inner side, and its position is with the point downwards, unless otherwise blazoned.

PHERÆ, a powerful city of Thessaly, near Mount Pelion; according to legend, the ancient royal seat of Admetus and Alcestit; and afterwards of political consequence under 'tyrants' of its own who long made their influence felt in the affairs of Greece, and repeatedly attempted to make them selves masters of Thessaly. One of these tyrants named Alexander, is particularly celebrated for his cruelties. It was one of his practices to bury innocent persons alive, and another to sew them up in the skins of wild beasts and set his hounds upon them. After a bloody reign of thirteen years, he was slain by his wife and her brother, 357 B. C. Five years later, P., with the rest of Thessaly, became subject to Philip of Macedon.—At P. there was a mineral spring, named Hyperia, famous for its healing virtues. A few ruins at Velestino still mark the site of the city.

PHERECY'DÉS, an ancient Greek writer, born in the island of Syros, one of the Cyclades, in the 6th c. B. C. He is said by Diogenes Laertius to have been a rival of Thales, and to have learned his wisdom from the Egyptians and Chaldeans. He wrote a *Cosmogony* in a kind of prose much resembling poetry, under the title *Heptamychos*, the meaning of which is doubtful. In a manner rather poetic than philosophic, he endeavoured in this work to shew the origin of all things from three eternal principles, *Time* or *Kronos*; *Earth*, as the formless and passive mass; and *Æther* or *Zeus*, as the formative principle. He taught the doctrine of the existence of the human soul after death; but it is uncertain if he held the doctrine of the transmigration of souls, afterwards promulgated by his disciple, Pythagoras. Of his work, only fragments are extant, which have been collected and elucidated by Sturtz (Gera, 1798; 2d ed., Leip. 1824).—Another P., who lived in the 5th c. B. C., compiled the mythical histories of Athens and other states, but, except a few fragments, the work is lost. See Sturtz, *Pherecydis Fragmenta* (Leip. 1824).

PHIGALIAN MARBLES, the name now given to the sculptured frieze taken from the cella of the temple of Apollo at Phigalia in Arcadia in 1814, and transferred to the British Museum. It represents the contests between the Centaurs and Lapithæ. The Phigalian temple of Apollo is, next to the Theseum at Athens, the most perfect architecture.

ruin in all Greece; but owing to its sequestered position at the head of a lonely and rocky glen among the Arcadian hills, it long remained unknown in modern times, except to the shepherds of the district; and to the same circumstance it probably owes, in part, its preservation. Chandler first visited and described it in 1765; he was followed by Gell, Dodwell, and others; and in 1812 it was very carefully examined by a body of artists and scholars, the results of whose investigations are given in Stackelberg's *Der Apollontempel zu Bassä in Arkadien* (Rome, 1826). The temple is built of a hard yellowish-brown limestone, stands north and south, was originally about 125 feet long and 48 broad, and had 15 columns on either side, and 6 on either front, in all 42, of which 36 still remain.

PHILADELPHIA, the metropolis of Pennsylvania, and the second city in population in America, is situated on the Delaware and Schuylkill Rivers, lat. $39^{\circ} 56' 59''$ N., long. $75^{\circ} 9' 54''$ W., 96 miles from the Atlantic, 87 m. S. W. of N. York, and 136 m. N. E. of Washington. The compactly-built portion occupies a space about 5 m. long by $3\frac{1}{2}$ m. wide, but the incorporated city extends over 120 sq. miles. It is regularly built in square blocks, with wide streets, extending upwards of 350 miles. Seven minor squares or parks were laid out at an early day; and Fairmount Park, of 2740 acres, upon the Schuylkill, is justly celebrated for its picturesque beauty. The number of houses, on April 1, 1871, was 122,751, of which 114,303 were dwelling-houses, 451 churches, 134 public school-houses, 964 foundries and factories, 73 mills, 63 halls and theatres, and 1435 workshops of various kinds.

The streets are traversed by about 200 m. of railroads, which carried, in 1870, upwards of 60,000,000 passengers, and travelled daily over 30,000 m. P. is supplied with water from the Schuylkill and Delaware, through 462 m. of iron mains. The daily supply from the Fairmount works alone is 37,249,385 gallons. A paid fire department was organised January, 1871. Among the many imposing public buildings are Girard College, which cost \$2,000,000; the Custom House, formerly the U. States Bank, cost \$500,000; U. States Mint, which cost \$200,000; Merchants' Exchange, \$300,000; Chamber of Commerce, U. States Naval Asylum, &c. The State House is the most interesting building in America. It contains Independence Hall, where was signed the Declaration of Independence in July, 1776. The Academy of Music, the Masonic temple, numerous costly and ornate churches, among which are the Roman Catholic Cathedral, St Mark's Episcopal Church, and the Arch St. Methodist Church, with spire of white marble, and the massive granite, sandstone, and marble warehouses, banks, railroad and insurance offices, hotels, and extensive market-houses in various styles of Tuscan, Grecian, and Byzantine, which rise on every side in the business districts, attest the wealth and enterprise of her capitalists.

P. possesses some of the most valuable libraries in the Union, among which are the Philadelphia Library, founded through the influence of Dr Franklin, and recently endowed by Dr James Rush with \$1,000,000; the Mercantile Library; the libraries of the American Philosophical Society, the Academy of Natural Sciences, the Franklin Institute for the promotion of the mechanic arts. The medical schools of P. have long been held in high esteem, and attract yearly a large body of students. There are in P. 14 public libraries, 34 literary, scientific, and art associations, 47 Bible, tract, and missionary publications, 91 charitable and benevolent associations, 38 hospitals (3 for the insane, 1 for deaf-mutes, and 1 for the blind), 15 colleges (one entitled a university), 5 medical colleges, 19 daily, 3 tri-weekly, 12 semi-weekly newspapers, 44 weekly, 5 semi-monthly, 32

monthly, 3 quarterly, and 1 semi-annual publications. There are also 33 banks (30 of which are national), 5 savings banks, 181 insurance (85 fire, 65 life, &c.), 36 coal and iron, 17 iron and steel, 24 mining, 19 oil, 34 railroad, 17 street railroad, 3 zinc, and 7 ferry companies.

The public schools of P. numbered, in 1870, 380 (2 high schools), with an average attendance of 71,029 pupils, and 12 night schools for adults, artisans, &c., have an attendance of 2300 pupils. The amount expended for public instruction, in 1870, was \$1,297,744. In 1870 there were 451 edifices devoted to religious services, 90 of which were Presbyterian, 88 Episcopal, 72 Methodist, 44 Baptist, 38 R. Catholic, 25 Lutheran, 16 German Reformed, 14 Friends, and 38 belonging to minor sects.

Among the benevolent and reformatory institutions of P. are the Eastern State Penitentiary (q. v.), the Houses of Refuge, the House of Correction, now erecting at a cost of \$1,000,000, the Pennsylvania Hospital (q. v.), the Asylum for the Insane, Wills Hospital for the Blind, Asylums for Deaf-mutes, for Widows and Orphans, Foster Home for Children, Houses of Industry, and for employment of the poor, the St Joseph's Hospital, the Episcopal Hospital, the Christ Church, the St John's Orphan, Magdalen, and coloured orphans' asylums, and the Union Benevolent Association.

In 1870 the foreign imports were valued at \$14,952,371, the exports at \$16,640,478. The manufacturing establishments of P. numbered, in 1860, 6298, and in 1870, almost 10,000. The capital employed increased from \$73,318,885, in 1860, to \$220,000,000, in 1870, and the value of her products from \$135,979,777, in 1860, to upwards of \$300,000,000, in 1870, 120,000 persons are directly employed in her manufactures, whose annual wages exceed \$52,000,000. The U. States Navy-yard, on the Delaware, at League Island, near the city, was selected by the government as a harbour for the iron monitors out of service.

The city is divided into 31 wards, and is governed by a mayor and councils. The receipts, in 1869, were \$16,243,916, of which \$6,324,120 were from taxes; expenditures, \$8,139,560. Assessed value of real and personal property, 1871, \$500,836,832; debt, May 1, 1871, \$45,259,425.

The climate of P. is variable, though milder than elsewhere in Pennsylvania. The mean temp. for 32 years: spring, $51^{\circ} 8'$; summer, $73^{\circ} 6'$; autumn, $54^{\circ} 1'$; winter, $32^{\circ} 9'$, and for the year, $53^{\circ} 1'$. As regards population, P. ranks as the 7th city of the civilized world, and in 1850 numbered 408,762; 1860, 565,529; 1870, 673,726; 1880, 847,170.

P. was founded in 1682 by William Penn, on 'a spot that seemed to have been appointed for a town,' and of which he wrote, 'Of all places in the world, I remember not one better seated.' Its early settlers were mostly of the Society of Friends. In 1684 it had 2500 inhabitants. In 1729 was established the *Pennsylvania Gazette*, afterwards edited by Franklin. The first colonial congress met here in 1774. It was the seat of the United States bank, the capital of the United States till 1800, and the most populous city in America, until surpassed by New York.

PHYLÆ, the name of a celebrated island lying in the midst of the Nile, south of Syene, beyond the frontier of Egypt, in $24^{\circ} 1' 28''$ N. lat. It is a small granite rock, about 1000 feet long, and 200 feet broad, on which is placed a suite of buildings, not of the most remote antiquity, but distinguished for great architectural beauty. The oldest of these, consisting of a hypæthral or roofless hall, was built in the reign of Nectanebus I., 377—357 B.C. They are dedicated to the goddess Isis, or the Egyptian Venus. The principal remains consist of the great temple of Isis, erected by Ptolemy II. or Philadelphus, and continued by his successors, especially by Ptolemy III., Evergetes, 247—222 B.C., with propylons constructed by Ptolemy

VII., or Philometer, and Lathyrus. The charming little temple, the Mastabat el Pharaoun, or Pharaoh's Bed of the Arabs, was made in the reign of Trajan, 100 A. D. The temples are particularly important as containing the principal representations of the story of Osiris, his birth, bringing up, death, and embalmment by Isis. Commenced in the reign of Nectanebus I., and continued by the Ptolemies and Romans, the worship of Isis lingered here till 453 A. D., or sixty years later than the edict of Theodosius. After the subjection of the Blemmyes to the Nubian Christians, the temple was converted into a church, and the paintings daubed with mud; and, in 577 A. D., the bishop Theodorus changed the pronaos of the temple of Isis into the church of St Stephen; and a Coptic church, at a later period, was built out of the ruins. The whole area of the ancient temple was about 435 feet long by 135 broad, in the centre of the dromos. At the present day the island is deserted. It is a favourite resort of travellers ascending to Nubia, and is one of the best of the remaining ruined sites of ancient Egypt.

Pliny, N. H., v., c. 29; Servius, *Æneid*, v. 154; Jones and Gourey, *Views on the Nile*; Wilkinson, *Modern Egypt*, ii. 295—303; Brugsch, *Reiseberichte aus Ägypten*, p. 256; Lepsius, *Reise*, p. 262.

PHILEMON AND BAUCIS, according to a classic myth, finely poetised by Ovid in his *Metamorphoses*, were a married pair, remarkable for their mutual love. Jupiter and Mercury, wandering through Phrygia in human form, were refused hospitality by every one, till this aged pair took them in, washed their feet, and gave them such humble fare as they could provide. On going away, the gods took them with them to a neighbouring mountain, on looking from which they saw their village covered with a flood, but their own cottage changed into a splendid temple. Jupiter permitted them to make any request they chose, but they only asked to be servants of his temple, and that they might die at the same time. When, accordingly, they were seated at the door of the temple, being now of great age, they were changed, Philemon into an oak, and Baucis into a linden. They felt the change taking place, and as long as the power remained with them, looked most tenderly upon one another.

PHILEMON, EPISTLE OF PAUL to, is the shortest of the four extant letters which the apostle wrote from Rome during his captivity. We either directly learn, or legitimately infer from its contents, that Philemon, who probably lived at Colossæ, was a man of considerable wealth, the head of a numerous household, and liberal to the poor. He had possessed a slave called Onesimus, who had run away from him, after—it has been thought (verse 18)—robbing or defrauding him. Onesimus, however, coming to Rome, had been brought into contact with Paul, and converted to Christianity. At first the apostle thought to retain him as his personal attendant, for he was now, as he tells us (verse 9), 'Paul the aged;' but on further consideration, he resolved to send him back to his former master. The epistle is simply a brief letter, begging Philemon to pardon Onesimus, and to receive him 'not now as a servant, but above a servant, a brother beloved.' It exhibits an exquisite tenderness and delicacy of feeling, with all that tact and subtlety of address, by which Paul was wont to find his way into the innermost heart of men. The historical evidence of its authenticity is complete. Even Baur has remarked that modern criticism in assailing this particular book runs a greater risk of exposing itself to the imputation of an excessive distrust—a morbid sensibility to doubt and denial—than in questioning the claims of any other epistle ascribed to Paul.

PHILIDOR, the assumed name of a French family, which has produced many distinguished musicians, and one celebrated composer. The real name of the family was DANIGAN, and the additional appellation P. was assumed by Michel Danigan, the hautboist to Louis XIII., on account of his having equalled a celebrated player on the same instrument, named Filidori. The name was transmitted to his descendants, the most famous of whom was his grandson, FRANÇOIS ANDRÉ DANIGAN, who was born at Dreux, in the department of Eure et Loir, 1726, studied music, and produced a great many comic operas, all long forgotten. It may be noticed that, while residing in London—whither he had fled on the outbreak of the revolution—(1779), he set to music the 'Carmen Sæculare' of HORACE, a work which is considered by many as a masterpiece of musical art. He died in London, 31st August 1795. P.'s modern reputation rests exclusively on his skill in the game of chess, the principles of which he has laid down with exceeding clearness. It was in great measure his passion for this game which prompted him to visit Germany and Holland, where at that time the most distinguished players were to be found, in order to measure his strength with theirs. He was one of the founders of the London Chess Club. Here it was that in 1777 he published his *Analyse du Jeu des Echecs* (Analysis of the Game of Chess). One principle, then unique, seems to lie at the root of all P.'s games—i. e., to maintain and support carefully the pieces in the centre of the board—and rather than deviate from this principle, he rejects the opportunity of making an effective and advantageous move. He practised with success the playing of games blindfold; but in this particular he has been far surpassed in recent times by Harrwitz, and more recently by Morphy.

PHILIP II., king of Macedonia, and father of Alexander the Great, was born at Pella in 382 B. C. He was the youngest son of Amyntas II. and Eurydice. At Thebes, whither he was taken as a hostage by Pelopidas, he spent part of his early life, employing his exile in studying the art of war, and the constitution and laws of the Greek states, as well as the literature and the character of the people—pursuits which were of the greatest service to him afterwards, when called on to administer the government of the Macedonian kingdom. The assassination of his eldest brother, Alexander II., by Ptolemy Alorites, after a short reign of two years (369—367 B. C.), and the death of his second brother, Perdiccas III., in battle (360 B. C.), placed him at the head of affairs in Macedonia, as guardian to his nephew Amyntas, still an infant. In a few months, P. made himself king, the rights of Amyntas being set aside. Dangers soon beset him from without and from within. The Illyrians and other neighbouring tribes assailed his kingdom on different sides; while two pretenders to the throne, urged on by the Athenians and Thracians, stirred up civil commotion. But foreign and domestic enemies soon disappeared before the decision, the energy, and the wise policy of the young king. In the brief space of a year he had secured the safety of his kingdom, and had gained for himself a dreaded name. At this time he was only 24 years of age. Henceforward his policy was one of aggression, and his every thought was directed to the extension of his empire and the spread of Macedonian influence. The Greek towns on the coast of Macedonia were the first objects of attack. After possessing himself of Amphipolis and Pydna, by means little consistent with the faith of treaties, he handed over to the Olynthians the city of Potidea, which he had taken from the Athenians. In Thrace he captured the small town Crenides, which, under its new name,

PHILIPPI, soon acquired great wealth and fame, and ultimately became celebrated in profane as well as in sacred history. The surrounding district was rich in gold-mines, which proved a source of great revenue to P. (about, say, £250,000 annually), and supplied him plentifully with the means of paying his armies, of bribing traitorous Greeks, and of opening the gates of many cities, the sieges of which might otherwise have cost the blood of thousands. After a few years of comparative leisure, he turned his ambitious views southward; and capturing Methone (at the siege of which he lost an eye), he advanced into Thessaly, and ultimately to the Strait of Thermopylæ, which, however, he did not attempt to force, as it was strongly guarded by the Athenians. He therefore returned into Macedonia, and directed his arms against the Thracians, waiting for a more fitting occasion to carry out his darling project. Such an opportunity was not long wanting. After capturing all the towns of Chalcidice—the last of which was the important city of Olynthus—he made peace with the Thracians, and next year with the Athenians, who had been at war with him in defence of their allies the Olynthians. It was this siege of Olynthus by P. which called forth these Olynthiac orations of Demosthenes, which are still admired as efforts of oratorical genius hitherto unequalled in any country. P. was now requested by the Thebans to interfere in the war ('the Sacred War') which was raging between them and the Phocians. He marched into Phocis, destroyed its cities, and sent as colonists to Thrace many of the inhabitants (346 B.C.). The place which the Phocians had occupied in the Amphictyonic Council was transferred to P., and he was appointed, jointly with the Thebans and Thessalians, as president of the Pythian games. His next step was to secure a footing in the Peloponnese, by espousing the cause of the Argives, Messenians, and others, against the Spartans. In 339 B.C. the Amphictyonic Council declared war against the Locrians of Amphissa; and, in the following year, appointed P. commander-in-chief of their forces. The Athenians were alarmed at his approach into Greece in this capacity, and formed a league with the Thebans against him; but their united army was utterly defeated at the battle of Chaeronea (338 B.C.), and all Greece was at the feet of the conqueror. He was now in a position to enter on the great dream of his later years—viz., to invade the Persian empire, and revenge the injuries of Greece. Deputies from the different states of Greece assembled in congress at Corinth; and after resolving to make war on the Persian king, chose P. as leader of their armies. Preparations were in progress for this great expedition when he was suddenly cut off by the hand of the assassin Pausanias, at a festival celebrating the marriage of his daughter with Alexander of Epirus (336 B.C.). A private grudge at P., for neglect to punish an insult offered to Pausanias by Attalus, was said to be the motive which inspired the murderer, though suspicion is not wanting that the deed was done at the instigation of Alexander and his mother Olympias, who had retired from the court in disgust at P.'s marriage, the year previous, with Cleopatra, daughter of Attalus, one of his generals. P. was a man given to self-indulgence and sensuality; he was faithless in the observance of treaty obligations, and unscrupulous as to the means by which he gained his ends; but he had to deal with factious and faithless opponents, which may help to explain, if it does not justify his policy; while his clemency as a victor has won the admiration even of the virtuous Cicero, who pronounces him 'always great.' Of his force and energy of

character, his acuteness, fertility of invention, and eloquence, it is impossible to speak too highly. He was at the same time a lover of learning, and a liberal patron of learned men. He reigned from 359 to 336 B.C.

PHILIP III., OF MACEDON. On the death of Alexander the Great at Babylon in 323 B.C., the army elected as king, under the name of Philip III., Arrhidaeus, son of Philip and Philinna of Larissa, one of his many wives. He was a youth of weak understanding, and was totally unfit for the duties of government. His wife, Eurydice (daughter of Amyntas, son of Perdiccas III.), whom he married in 322 B.C., endeavoured, on their return to Macedonia, to oppose the measures of Polyperchon and Olympias in support of the young Alexander, posthumous son of Alexander the Great and Roxana. But her army was defeated; she herself was taken prisoner; and, along with her husband, was put to death in 317 B.C.

PHILIP II., KING OF SPAIN, the only son of the Emperor Charles V. (q.v.) and Isabella of Portugal, was born at Valladolid, 21st May 1527. He was brought up in Spain, and carefully educated under the superintendence of able tutors, by whose instructions he greatly profited, becoming an accomplished linguist and mathematician, and a connoisseur in architecture and the fine arts. But all attempts to indoctrinate him with the chivalric ideas of the time were utterly futile. From his very childhood he was distrustful and reserved; he invariably spoke with slowness and an air of deep reflection which was too marked to be wholly real, and exhibited in his manners a *sang-froid* which even in his early years was rarely disturbed by ebullitions of passion. While still very young he was intrusted, under the direction of a council, with the government of Spain, and in 1543 he espoused Mary of Portugal, who died three years after. In 1548 he went to join his father at Brussels, and there adopted the multitudinous equipage and minute and pompous etiquette of the late Burgundian court, which from this time he retained. While at Brussels, P. was presented to his future subjects, and was at the same time fully initiated into his father's policy, the two chief items of which were the maintenance and extension of absolute rule throughout his dominions, and the support and propagation of the Catholic religion. In 1551 he married Mary Tudor, Queen of England, and to gain the support of that country to his political projects, and at the same time restore it to the Roman Catholic pale, he laid aside his ordinarily cold and haughty demeanour, and laboured to ingratiate himself with his wife's subjects, taking the utmost care to avoid exciting the national jealousy of foreign influence. But his plans were discovered and frustrated, and this disappointment, combined with the annoyance to which he was subjected by the jealousy of his wife, prompted him to leave England (which he did for ever), and return to Brussels (September 1555). In the following month he became, by the abdication of his father, the most powerful potentate of Europe, having under his sway, Spain, the Two Sicilies, the Milanese, the Low Countries, Franche Comté, Mexico, and Peru; his European territories being more fertile, and their inhabitants more wealthy and prosperous, than any others on the continent, while his army was the best disciplined, and headed by the greatest generals of the age. The treasury alone was deficient, having been drained by the enormous expenditure of his father's wars. P. was eager to begin the crusade in favour of Catholicism, but he was compelled to postpone

it, owing to a league which had been formed between France, the Pope, and the Sultan, to deprive him of his Italian dominions. He soon got over his religious scruples at engaging in warfare with the pope, and intrusted the defence of the Sicilies to Alva (q. v.), who speedily drove out the pope and the French, and conquered the papal territories, while P. himself vigorously prosecuted the war against France in the north, and defeated the French at St Quentin (q. v.) (August 10, 1557) and Gravelines (July 13, 1558). These reverses forced the French (the pope having already made a separate treaty) to agree to terms of peace at Chateau-Cambresis (April 2, 1559). P.'s wife was now dead, and after an unsuccessful attempt to obtain the hand of her successor, Queen Elizabeth, he espoused Isabella of France, and returned to Spain, where from this time he always resided. Before leaving the Low Countries, he solemnly promised to withdraw almost the whole of his Spanish troops who preyed upon the peaceful Flemings, but he firmly refused to annul or modify the rigorous edicts of his father against heretics. His realm being now at peace, he resolved, as a necessary preliminary to the carrying out of his great proselytising scheme, to replenish his treasury, a thing impossible without forced contributions, which, at that time, could only be obtained in those countries over which he held absolute rule—viz., Spain and America. He therefore set about establishing absolute government in those of his states that were in possession of something like free institutions, and with this view sought to introduce the Inquisition into the Low Countries and Italy. But the introduction of this instrument of tyranny was successfully resisted in Naples and the Milanese; in Sicily its powers were so shackled as to render it quite a harmless institution; but these failures only stimulated him the more to establish it in all its pride and power in the Low Countries. For a number of years it continued in vigorous action in that country; but the natural result of such a course of conduct was a formidable rebellion of all classes, Catholic and Protestant, which was partially successful—the northern portion (the 'seven united provinces') establishing its independence in 1579. In this conflict the resources of Spain were largely expended, and to replenish his treasury in the speediest manner possible, P. exacted enormous contributions from Spain, abolishing all special communal or provincial privileges and rights which might interfere with his actions, and suppressing all insurrection and discontent by force of arms or the Inquisition. During the first half of his reign he engaged in a desultory warfare with the Barbary corsairs, who were supported by the Turks—the only memorable incident of which was the famous naval victory of Lepanto (q. v.), won September 16, 1571. In 1580 the direct male line of Portugal having become extinct, P. laid claim to the throne, and after the Duke of Alva had occupied the kingdom with an army, the Spanish monarch's title was recognised by the Portuguese estates. His enmity to England on account of the anti-Spanish policy of Queen Elizabeth incited him to attempt the conquest of that country, but his most formidable attempt failed signally. See ARMADA. After the accession of Catharine de Medicis to power, France and Spain drew closer the bonds of amity which had previously subsisted between the two countries; but the refusal of Catharine to adopt P.'s plans for the wholesale slaughter of heretics produced a coolness in their relations. However, when Henry, king of Navarre, a Huguenot, became heir-presumptive to the throne, P. allied himself with the Guises and the other chiefs of the Catholic party who were in rebellion, and his

obstinate persistence in these intrigues after the cause of the Guises was shewn to be hopeless, prompted Henry to declare war against him. The Spaniards had the worst of it, and P. was glad to conclude the treaty of Vervins (2d May 1598). He died in the Escorial at Madrid, on 13th September of the same year. It cannot be denied that P. was gifted with great abilities, but he was also a visionary, especially in politics, and engaged in so many grand enterprises at once as to overtask his resources without leading to any good or profitable result. No single kingdom in Europe could have long stood against him, but he was always at war with at least two at a time; and even the splendid opportunity which the extinction of the direct Capetian line in 1589 gave him for uniting France, Spain, and Portugal in one great monarchy, could not restrain this unfortunate peculiarity. His fanatical enthusiasm for Catholicism, in which he was surpassed by no man who ever lived, and the zeal with which he persecuted all heretics through the Inquisition, combined with the odious tyranny of his secular government to degrade Spain, by breaking the proud and chivalrous spirit which had been the source of its pre-eminence among European nations, while his virulent persecutions of the industrious Moriscoes, and his oppressive exactions, put a stop to the commerce of the country. By his fourth wife, Anne of Austria, he had a son, Philip III.

PHILIP V., king of Spain, and the founder of the Bourbon dynasty in that country, was the second son of the Dauphin Louis (son of Louis XIV.) of France, and was born at Versailles, December 19, 1683. The last king of Spain of the Hapsburg dynasty, Charles II., had successively promised the succession to the throne to Charles, archduke of Austria, the great grandson of Philip III. of Spain, and to P., then Duke of Anjou, the son of his own eldest sister; but becoming cognizant of a secret treaty which had been agreed to between England, France, and Holland for the partition of Spain, he, to prevent the dismemberment of his kingdom, left by will the succession to P. of Anjou. France immediately seceded from the partition treaty, and, on the death of Charles II. in 1700, P., who was the favourite candidate among the Spaniards, with the exception of those in the eastern provinces, took possession of the kingdom (April 21, 1701); and, to gain over Savoy to his side, and thus create a diversion in Italy against Austria, he married Maria Louisa, daughter of Victor Amadeus. War almost immediately broke out between the rival claimants, Charles being supported by the 'grand alliance,' which included England, Austria, and Holland, and subsequently (January 1702) Prussia, Denmark, and Hanover (May 1703), Portugal, and (October 1703) Savoy. See SUCCESSION, WAR OF SPANISH. The fortune of war was mostly on the side of the allies; but France and Spain carried on the contest heroically, and, though at great sacrifices, the throne was secured to P. by the peace of Utrecht (April 11, 1713). In the following year the queen died, and P. espoused Elizabeth Farnese of Parma, who immediately induced her husband to commit the reins of government to Alberoni (q. v.); in fact, so much was the weak-minded king under the influence of his talented young wife, that he granted everything she asked. 'He was,' says Sismondi, 'remarkable for good nature, he had few faults and as few virtues, his sentiments were just and honourable, but he was wholly deficient in energy; he had no taste for anything beyond devotional exercises and the chase; he was made to be governed, and he was so all his life.' Alberoni's adventurous foreign policy, which at first succeeded in restoring the

Spanish rule in Sicily and Sardinia, brought down upon Spain the wrath of the Quadruple Alliance (France, England, Holland, and Austria), and war was only averted by his being dismissed; but his dismissal was really produced by his neglecting to further the queen's pet scheme of providing sovereignties in Italy for her sons, who seemed to have little chance of obtaining the throne of Spain. The strong bond of union which had hitherto subsisted between Spain and France was broken, in 1725, by the refusal of the regent of the latter country to fulfil certain matrimonial agreements; but four years afterwards the two countries joined with England and Holland against the emperor, and in 1731 P. took measures to recover the old Spanish possessions in Italy. The war which followed at last satisfied the queen by giving the kingdom of the Two Sicilies to her son Charles (1736), but P., in attempting to obtain still greater advantages over Austria, was led into a war of which he was not destined to see the result. He died at Madrid, July 9, 1746.

PHILIPPE II., better known as **PHILIPPE AUGUSTE**, king of France, was the son of Louis VII. and Alix of Champagne, and was born in August 1165. He was crowned, in 1179, during the life of his father, succeeded him in 1180, and proved one of the greatest monarchs of the Capetian dynasty. His marriage with Isabella of Hainault, a descendant of the Carolingians, established more completely the right of his family to the throne of France. He first made war upon the Count of Flanders, to obtain the districts of Vermandois, Valois, Amienois, and Artois, which belonged to his wife, and, after various fortune, obtained Amienois and part of Vermandois at once, and the rest after the count's death in 1185. By the advice of St Bernard (q. v.) he rigorously punished heretics, despoiled the Jews, absolving their debtors of all obligations, excepting one-fifth, which he transferred to himself; put down with vigour the numerous bands of brigands and priest-haters who devastated the country and burned the churches and monasteries, compelling their chief leader, the Duke of Burgundy, to submit (1186) to his authority—acts which gave him great popularity among his subjects. He sustained the sons of Henry II. of England in their rebellions against their father, and conquered, in conjunction with Richard Cœur-de-Lion, many of the English possessions in France. After the accession (1282) of Richard to the throne, P. and he set out together on the third crusade; but quarrelled while wintering in Sicily, and this dissension continuing, P., after a sojourn of 3½ months in Syria, set out (31st July 1190) on his return to France, after taking a solemn oath to respect the integrity of Richard's dominions; but no sooner had he returned than he entered into an arrangement for the partition of Richard's territories in France with his unworthy brother John. Some acquisitions were made, but Richard's sudden return upset the calculations of the conspirators, and a war immediately commenced between the two monarchs, in which P. had at one and the same time to defend his territories from the English, and the Counts of Champagne, Boulogne, Bretagne, and Hainault, who attacked them on all sides. In order to obtain money, he was obliged to rescind his edicts against the Jews; but the mediation of Pope Innocent put an end (13th January 1199) to a war which was productive of no other result than the exhaustion of the strength of the combatants. Richard of England died within two months after; but war almost immediately recommenced with England, regarding the respective claims of King John of England and his nephew

Arthur of Bretagne to the French heritage of Richard Cœur-de-Lion, which consisted chiefly of Anjou, Maine, and Touraine. Arthur had applied for aid to P., and the French king immediately responded by causing the young duke to be recognised in the above-mentioned provinces; but a quarrel in which he became involved with the pope on account of his having divorced his second wife, Engelburga of Denmark, to marry Agnes of Meran, a Tyrolese princess, compelled him to leave the English in possession for a little time longer. The defeat, capture, and subsequent murder of Arthur, however, again brought him into the field. The English provinces in France were attacked by the combined French and Bretons; Normandy and Poitou, with the three disputed provinces, were annexed to France; and the English dynasty in Bretagne dispossessed by a French one (26th October 1206). During 1211—1214, P. was engaged in a war with King John of England and the Emperor Otho of Germany, who had leagued themselves against him, in which he was on the whole successful. During the rest of his reign, P. was occupied in consolidating his new possessions, and took no part either in the war with the Albigenes or that in England, though his son Louis (q. v.) went to the latter with an army. P. succeeded in establishing the unity of his dominions, and in emancipating the royal authority from the trammels of the papacy and clergy, and vindicated his sovereign authority over the latter as his subjects, irrespective of the pope. His measures, without alienating the great feudal lords, tended firmly to establish his authority over them, and to emancipate the larger towns from their sway. To increase the unity of the kingdom, and strengthen the central power, he established at Paris a chamber of twelve peers, six lay and six ecclesiastical, who almost always supported his plans, even against the court of Rome. Finally, he largely improved and embellished Paris, built many churches and other institutions, and encouraged commercial associations; he also fortified many of the chief towns, including the capital. He died at Mantes, July 14, 1223.

PHILIPPE IV., surnamed *Le Bel* or 'Fair,' king of France, the son of Philippe III., king of France, and Isabella of Aragon, was born at Fontainebleau in 1268, and succeeded his father in 1285. By his marriage with Queen Joanna of Navarre, he obtained Navarre, Champagne, and Brie. For several years he carried on a struggle with the Count of Flanders to obtain possession of that country, and also seized Guienne from the English; but was, in the end, obliged to restore Guienne and Flanders beyond the Lys. The great events of P.'s reign were his war with the papacy and the extermination of the Knights Templars; the former had its origin in the attempt of the king to tax the clergy as well as the laity for the heavy expenses of his numerous wars. Boniface forbade the clergy to submit to taxation, while P., on his side, ordered that neither money nor valuables were to be exported, thus cutting off a main supply of papal revenue; and on the pope's legate insolently reprimanding him, he threw him into prison. P. now called an assembly of states, in which deputies of towns appeared—though not for the first time—and obtained assurance of their support, even in case of excommunication and interdict. Boniface, in turn, assembled a council at Rome (1302), which supported his view, and the celebrated bull, *Unam Sanctam* (q. v.) was issued. P. caused the bull to be publicly burned, and with the consent of the states-general confiscated the property of those prelates who had sided with the pope. Boniface now excommunicated him.

but the king, nothing daunted, sent to Rome his general, William de Nogaret, who seized and imprisoned the pope; and though he was released after a few days by a popular rising, he soon afterwards died. In 1304, P. obtained the elevation of one of his own creatures to the papal chair as Clement V., on condition of his residing at Avignon, and giving up the Knights Templars (q. v.). In accordance with this agreement, the Templars were seized (1306—1314), and burned by hundreds, and their wealth appropriated by Philip. The grandmaster, Jacques Molay, was burned, 18th March 1314, and when dying he summoned P. to appear within a year and a day, and the pope within forty days, before the judgment-seat of God; strange to say, both the pope and king died within the time mentioned, the latter at Fontainebleau, November 29, 1314. P. during his whole reign steadily strove for the suppression of feudalism and the introduction of the Roman law; but while thus increasing the power of the crown, and also that of the third estate, he converted royalty, which was formerly protecting, kind, and popular to the mass of the people, into a hard, avaricious, and pitiless taskmaster. Under him the taxes were greatly increased, the Jews persecuted, and their property confiscated; and when these means were insufficient to satisfy P.'s avarice, he caused the coinage to be greatly debased; yet he was an able monarch, and under him France was extended almost to its present limits on the north and east.

PHILIPPE VI., OF VALOIS, king of France, was the son of Charles of Valois, younger brother of Philippe IV., and succeeded to the regency of France on the death of Charles IV., the proclamation of a king being deferred on account of the pregnancy of Charles IV.'s widow; but on her giving birth to a daughter, P. caused himself to be crowned king at Reims (May 29, 1328), and assumed royal authority. His right to the throne was denied by Edward III. of England, the grandson of Philippe IV., who declared that females, though excluded by the Salic law, could transmit their rights to their children, and therefore insisted upon the superiority of his own claims. P., however, was not only already crowned king, but he had the support of the people. His reign commenced gloriously, for marching into Flanders to support the count against his rebellious subjects, he wiped out the disgrace of Courtrai by vanquishing the Flemings at Cassel (August 23, 1328). He was obliged to give up Navarre (q. v.), as the Salic law of succession did not apply to it, but he retained Champagne and Brie, paying for them a considerable annual stipend. P. seems to have had no settled plan of government, and no systematic political action; his acts were regulated by the whim of the hour, and were mostly calculated to gratify his own vanity and love of show. From 1330 to 1336, constant encroachments had been made upon the English possessions in France, till at last Edward III.'s patience was exhausted; and, on August 21, 1337, he formally declared war, and a commencement of this terrible hundred years' contest was made both in Guienne and Flanders; it was carried on languidly for several years, the only prominent incident being the destruction of the French fleet off Sluys (June 24, 1340). In March 1343, P. established the 'gabelle,' or monopoly of salt, a heavy percentage tax on all mercantile transactions. The constant round of fêtes and tournaments at court was never interrupted, even when the war had well-nigh exhausted the wealth of the country, for the money to carry them on was immediately provided by some new tax or fresh confiscation. In 1346, Edward III. landed in Normandy, ravaged the whole country to the environs of Paris, and

totally defeated P. at Crécy (q. v.). A truce was then concluded, but the devoted kingdom had no sooner been released from war, than destruction in another and a more terrible form, that of the 'Black Death' (q. v.), threatened it. The wild extravagance of the court was nothing lessened by this visitation; but the financial embarrassments in which P. found himself, compelled him to agree to the passing of a law (1333) which gave to the assembly of the states the sole power of imposing taxes. He received Dauphiné in gift in 1349, purchased Majorca from its unfortunate king, and died August 22, 1350, neither loved nor respected. He was a despiser of learning, and a bigot.

PHILIPPE LE HARDI (*Philip the Bold*) the founder of the second and last ducal house of Burgundy, was the third son of Jean, king of France, and his wife Bonne of Luxemburg, and was born January 15, 1342. He was present at the battle of Poitiers (1356), and displayed such heroic courage, venturing his own life to save that of his father, as gained for him the sobriquet of *le Hardi*, or 'the Bold.' He shared his father's captivity in England, and on returning to France in 1360, received in reward of his bravery the duchy of Touraine, and subsequently (1363) also that of Burgundy, being created at the same time the first peer of France. On the accession of his brother, Charles V., to the throne of France, P. had to resign Touraine, but, as a compensation, obtained in marriage Margaret, the heiress of Flanders. In 1372, he commanded the French army opposed to the English, and took from them many of their possessions. In 1380, he exerted himself to suppress the sedition of the Flemish towns against their count, and succeeded with some of the malcontents; but the citizens of some of the populous places, especially Ghent, were possessed with such a fever of independence, that after many fruitless attempts to induce them to return to their allegiance, P. raised an army, and inflicted upon them the bloody defeat of Rosbeck (November 27, 1382), leaving 26,000 of them on the field. Flanders, the county of Burgundy, Artois, Rethel, and Nevers fell to him by the death of the count in 1384, and the influence of his power, combined with prudence and good management on his part, soon won the affection and esteem of his new subjects. Energy and wisdom characterised his government; arts, manufactures, and commerce were much and judiciously encouraged, and his territory (a kingdom in extent) was one of the best governed in Europe. During the minority and subsequent imbecility of his nephew Charles VI. of France, he was obliged to take the helm of affairs, and preserve the state from insurrection and sedition within, and the attacks of the English without. He was on his way to repel an attack of the latter on Flanders when he died at the chateau of Hall in Brabant, a little to the southwest of Brussels, April 27, 1404.

PHILIPPE LE BON, i.e., 'the Good,' Duke of Burgundy, the son of Jean 'Sans-pour' by Margaret of Bavaria, and grandson of Philippe the Bold, was born at Dijon (the capital of the duchy), June 13, 1396, and on the assassination of his father on the bridge of Montereau at the instigation of the dauphin (afterwards Charles VII.), succeeded to the duchy of Burgundy. Bent on avenging the murder of his father, he entered into an offensive and defensive alliance with Henry V. of England at Arras in 1419, at the same time recognising him as the rightful regent of France, and heir to the throne after Charles VI.'s death. This agreement, which disregarded the Salic law, was sanctioned by the king, parliament, university, and

states-general of France by the treaty of Troyes, but the dauphin declined to resign his rights, and took to arms; he was, however, defeated at Crevant (1423) and Verneuil (1424), and driven beyond the Loire. Some disputes with the English prompted P. to conclude a treaty with the king of France in 1429. However, the English, by ceding to P. the province of Champagne, and paying him a large sum of money, restored him to their side. At this time, by becoming heir to Brabant, Holland, Zealand, and the rest of the Low Countries, he was at the head of the most flourishing and powerful realm in Western Europe; but though much more powerful than his superior, the king of France, he preferred to continue in nominal subjection. Smarting under some fresh insults of the English viceroy, and being strongly urged by the pope, he made a final peace (1435) with Charles, who gladly accepted it even on the hard conditions which P. prescribed. The English, in revenge, committed great havoc among the merchant navies of Flanders, which irritated P. to such an extent that he declared war against them, and in conjunction with the king of France, gradually expelled them from their French possessions. The imposition of taxes, which were necessarily heavy, excited a rebellion, headed, as usual, by the citizens of Ghent, but the duke inflicted upon them a terrible defeat (July 1454), though he wept over a victory bought with the blood of 20,000 of his subjects. The latter part of his reign was filled with trouble caused by the quarrels between Charles VII. and his son, the Dauphin Louis (afterwards Louis XI.), who had fled from his father's court, and sought shelter from P., although, after ascending the throne, far from shewing gratitude, he tried, in the most dishonourable manner, to injure his benefactor. P. died at Bruges, July 15, 1467, deeply lamented by his subjects. Under him, Burgundy was the most wealthy, prosperous, and tranquil state in Europe; its ruler was the most feared and admired sovereign of his time, and his court far surpassed in brilliancy those of his contemporaries. Knights and nobles from all parts of Europe flocked to his jousts and tournaments.

PHILIPPEVILLE, a thriving town and seaport of Algeria, in the province of Constantine, and forty miles north-north-east of the city of that name, on the Gulf of Stora, between Cape Boujaroun and Cape de Fer. It was laid out in 1838 by Marshal Valée, on the ruins of the ancient Russicada, and is one of the prettiest towns in Algeria, and thoroughly French in its character. It is an important entrepôt of the commerce of the east of Algeria, and the country in the vicinity is picturesque and fertile, producing grain, tobacco, cotton, flax, and fruits. It contains numerous public offices, a large hospital and dispensary, Catholic and Protestant churches, public library and museum, theatre, &c. In the vicinity are quarries of the famous Filfila marble. A harbour has recently been constructed, including a pier and dock, which afford shelter to small merchant ships in bad weather. There are here several establishments for curing fish, and trade is carried on in grain and in fabrics of native manufacture. Philippeville is the chief station of the railway for the province of Constantine. Population about 15,000.

PHILIPPI, a city of Macedonia. It was named after Philip II. of Macedon, who conquered it from Thrace (up to which time it had been called Crenides, or the 'Place of Fountains'), and enlarged it because of the gold-mines in its neighbourhood. Philip worked the mines so well, that he got from them 1000 talents a year. It is famous on account

of the two battles fought in 42 B.C. between Antony and Octavianus on the one side, and the republicans under Brutus and Cassius on the other. The first engagement was undecided; in the second, 20 days after, the republic finally perished. The apostle Paul founded a Christian church here in 53 A.D., to which one of his epistles is addressed. The ruins of the city still bear the name of Philippi, or Feliba.

PHILIPPIANS, EPISTLE TO THE, one of the latest of the Pauline epistles. It was transmitted from Rome probably about the year 63 A.D., through Epaphroditus, apparently a pastor of the Philippian church, who had been sent to minister to the necessities of the apostle. The Philippian church was looked upon with peculiar tenderness and affection by Paul. It was the first fruits of his evangelisation in Europe; its members were singularly kind towards him; again and again, when he was labouring in other cities, such as Thessalonica and Coriath, they sent him contributions that he might not be burdensome to his new converts, and now they had sent one of the brethren all the way to Rome with presents for him, knowing that he was in bonds, and suspecting—what was in fact the case—that he might be in sore straits for his daily bread. His letter to them is deeply affecting. It contains not so much of doctrinal matter, as of a warm outpouring of his personal feelings towards his friends at Philippi. The historical evidence in favour of the authenticity of the Epistle is so strong, that it could hardly give way to any internal criticism; and the objections of this kind, urged by Baur, Schweigger, and others of the Tübingen school, who regard it as a Gnostic composition of the 2d c., are regarded as preposterous even by many Biblical scholars who do not profess to be orthodox.

PHILIPPICS, originally the three orations of Demosthenes against Philip of Macedon. The name was afterwards applied to Cicero's orations against the ambitious and dangerous designs of Mark Antony. It is now commonly employed to designate any severe and violent invective, whether oral or written.

PHILIPPINE ISLANDS, lie to the north of Borneo and Celebes, in 5° 30'—19° 42' N. lat., and 117° 14'—126° 4' E. long. They are more than 1200 in number, with an area estimated from 113,500 to 150,000 square miles. Pop. 4,319,264, three-fourths of whom are subject to Spain, the remainder governed, according to their own laws and customs, by independent native princes.

Luzon, in the north, has an area of 51,300 square miles, and Mindanao, or Magindanao, in the south, fully 25,000. The islands lying between Luzon and Mindanao are called the Bissayas, the largest of which are—Samar, area 13,020 square miles; Mindoro, 12,600; Panay, 11,340; Leyte, 10,080; Negros, 6300; Masbate, 4200; and Zebu, 2352. There are upwards of a thousand lesser islands of which little is known. To the south-west of the Bissayas lies the long, narrow island of Paragoa or Palawan, formed of a mountain-chain with low coast-lines, cut with numerous streams, and exceedingly fertile. The forests abound in ebony, logwood, gum-trees, and bamboos. Area, 8820 square miles. To the north of Luzon lie the Batanen, Bashee, and Babuyan Islands, the two first groups having about 8000 inhabitants, the last unpeopled.

The Sooloo Islands form a long chain from Mindanao to Borneo, having the same mountainous and volcanic structure as the P. I., and all are probably fragments of a submerged continent. Many active volcanoes are scattered through the islands; Mayon, in Luzon, and Buhayan, in Mindanao, of en-

causing great devastation. The mountain-chains run north and south, and never attain a greater elevation than 7000 feet. The islands have many rivers, the coasts are indented with deep bays, and there are many lakes in the interior. Earthquakes are frequent and destructive, Manila, the capital, having been nearly destroyed by one in 1863. On February 3, 1864, another terrific earthquake visited the province of Zamboanga, in Mindanao, levelling all the houses to the ground, and causing some of the smaller islands to disappear. The soil is extremely fertile, except where extensive marshes occur. In Mindanao are numerous lakes, which expand during the rainy seasons into inland seas. Rain may be expected from May to December, and from June to November the land is flooded. Violent hurricanes are experienced in the north of Luzon and west coast of Mindanao. Especially during the changes of the monsoons, storms of wind, rain, thunder and lightning prevail. The weather is very fine, and heat moderate, from December to May, when the temperature rapidly rises and becomes oppressive, except for a short time after a fall of rain. The fertility of the soil and humid atmosphere produce a richness of vegetation which is nowhere surpassed. Blossoms and fruit hang together on the trees, and the cultivated fields yield a constant succession of crops.

Immense forests spread over the P. I., clothing the mountains to their summits; ebony, iron-wood, cedar, sapan-wood, gum-trees, &c., being laced together and garlanded by the bush-rope or palasan, which attains a length of several hundred feet. The variety of fruit-trees is great, including the orange, citron, bread-fruit, mango, cocoa-nut, guava, tamarind, rose-apple, &c.; other important products of the vegetable kingdom being the banana, plantain, pine-apple, sugar-cane, cotton, tobacco, indigo, coffee, cocoa, cinnamon, vanilla, cassia, the areca-nut, ginger, pepper, &c., with rice, wheat, maize, and various other cereals.

Gold is found in river-beds and detrital deposits, being used, in form of dust, as the medium of exchange in Mindanao. Iron is plentiful, and fine coal-beds, from one to four feet thick, have been found. Copper has long been worked in Luzon. There are also limestone, a fine variegated marble, sulphur in unlimited quantity, quicksilver, vermilion, and saltpetre—the sulphur being found both native and in combination with copper, arsenic, and iron.

Except the wild cat, beasts of prey are unknown. There are oxen, buffaloes, sheep, goats, swine, harts, squirrels, and a great variety of monkeys. The jungles swarm with lizards, snakes, and other reptilia; the rivers and lakes with crocodiles. Huge spiders, tarantulas, white ants, mosquitoes, and locusts are plagues which form a set-off to the beautiful fireflies, the brilliant queen-beetle (*Elater noctilucus*), the melody of myriads of birds, the turtle-doves, pheasants, birds of paradise, and many lovely species of paroquets, with which the forests are alive. 'Hives of wild bees hang from the branches, and alongside of them are the nests of humming-birds dangling in the wind.'

The caverns along the shores are frequented by the swallow, whose edible nest is esteemed by the Chinese a rich delicacy. Some of them are also tenanted by multitudes of bats of immense size. Buffaloes are used for tillage and draught; a small horse for riding. Fowls are plentiful, and incredible numbers of ducks are artificially hatched. Fish is in great abundance and variety. Mother-of-pearl, coral, amber, and tortoise-shell are important articles of commerce.

The Tagals and Bisayers are the most numerous

native races. They dwell in the cities and cultivated lowlands; 2,500,000 being converts to Roman Catholicism, and a considerable number, especially of the Bisayers, Mohammedan. The mountain districts are inhabited by a negro race, who, in features, stature, and savage mode of living, closely resemble the Alfours of the interior of Papua, and are probably the aborigines driven back before the inroads of the Malays. A few of the negroes are Christian, but they are chiefly idolaters, or without any manifest form of religion, and roaming about in families, without fixed dwelling. The Mestizos form an influential part of the population; by their activity engrossing the greatest share of the trade. These are mostly of Chinese fathers and native mothers. Few Spaniards reside in the P. I., and the leading mercantile houses are English and American. The Chinese exercise various trades and callings, remaining only for a time, and never bringing their wives with them. The principal languages are the Tagalese and Bisayan. Rice, sweet potatoes, fish, flesh, and fruits form the food of the Tagals and Bisayers, who usually drink only water, though sometimes indulging in cocoa-wine. Tobacco is used by all. They are gentle, hospitable, fond of dancing and cock-fighting.

With the exception of two Spanish brigades of artillery and a corps of engineers, the army is composed of natives, and consists of seven regiments of infantry and one of cavalry. There is also a body of Spanish militia in Manila, whom the governor, as commander of the naval and land forces, may call out in an emergency. The navy has four steamships, one brig, six gun-boats, and a great number of feluccas for coast service.

Education is far behind, and similar to what it was in Europe during the middle ages. There is an archbishop of Manila and bishops of New Segovia, Nueva Caceres, and Zebu. Religious processions are the pride of the people, and are formed with great parade, thousands of persons carrying wax-candles, &c.

The natives not only build canoes, but ships of considerable tonnage. They weave various textile fabrics of silk, cotton, abaca, and very fine shawls and handkerchiefs from the fibre of pine-apple leaves. These are called pinas, and often sell for one or two ounces of gold apiece. The pinilian is the finest sort, and is only made to order—one for the queen of Spain costing 500 dollars. They work in horn, make silver and gold chains, fine hats and cigar-cases of fibres, and beautiful mats in different colours, ornamented with gold and silver.

The governor-general is appointed by the sovereign of Spain, and resides at Manila. There are also a lieutenant-governor, governors of provinces, and chiefs of pueblos or townships, who are elected yearly. Acting governors reside also at Zamboanga in Mindanao, and Iloilo in Panay. They are appointed for six years by the governor-general.

The revenue amounts to about £2,100,000, and the expenditure, including subsidies to Spain, nearly the same. In 1870 the budget was—receipts, £2,451,918; expenditure, £2,475,009. In 1858 the personal tax produced £401,793, and the government monopolies, of which tobacco is the chief, £1,499,990. To Spain was remitted £210,802. The gross receipts of the tobacco monopoly were £1,062,041, of which 63 per cent. was expended in paying for tobacco, manufacturing it, and other charges, leaving 37 per cent. of clear profit.

The principal exports are sugar, tobacco, cigars, indigo, Manila hemp, or Abaca (q. v.)—of which 25,000 tons are annually exported—coffee, rice, dye-woods, hides, gold-dust, and bees'-wax. Cotton, woollen, and silk goods, agricultural implements,

watches, jewellery, &c., are imported. British and American merchants enjoy the largest share of the business, the imports to Great Britain being upwards of £1,500,000 sterling yearly, and the exports thither nearly of the same value. There are seven British houses established at Manila, and one at Iloilo in the populous and productive island of Panay, which is the centre of an increasing trade. The total exports and imports of the P. I. have a value of about £6,000,000 yearly.

The Sooloo Islands have a population of 150,000; are governed by a sultan, whose capital is Sung, in 66° 1' N. lat., and 120° 55' 51" E. long., who also rules over the greatest part of Paragoa, the northern corner only being subject to Spain.

Luzon has a population of 2,500,000, one-fifth part being independent; the Bissayas islands, 2,000,000, of whom three-fourths are under Spanish rule. The population of Panay amounts to 750,000, and that of Zebu to 150,000. Of the numbers in Mindanao nothing is known; the districts of Zamboanga, Misamis, and Caragan, with 100,000 inhabitants, being all that is subject to Spain. The greater part of the island is under the sultan of Mindanao, resident at Selanga, in 7° 9' N. lat. and 124° 38' E. long., who, with his feudatory chiefs, can bring together an army of 100,000 men. He is on friendly terms with the Spaniards. Besides Manila, there are very many large and important cities, especially in Luzon, Pahay, and Zebu. The great centres of trade are Manila in Luzon, and Iloilo in Panay.

The P. I. were discovered in 1521 by Magellan, who, after visiting Mindanao, sailed to Zebu, where, taking part with the king in a war, he was wounded, and died at Mactan, 26th April 1521. Some years later the Spanish court sent an expedition under Villabos, who named the islands in honour of the Prince of Asturias, afterwards Philip II. For some time the chief Spanish settlement was on Zebu; but in 1581 Manila was built, and has since continued to be the seat of government.

PHILIPPINS, a Russian sect, so called from the founder, Philip Pustoswiät, under whose leadership they emigrated from Russia in the end of the 17th c., are a branch of the RASKOLNIKS (q. v.). They call themselves Starowerski, or 'Old Faith Men,' because they cling with the utmost tenacity to the old service-books, the old version of the Bible, and the old hymn and prayer-books of the Russo-Greek Church, in the exact form in which these books stood before the revision which they underwent at the hands of the patriarch Nekon in the middle of the 17th century. There are two classes of the Raskolniks—one which recognises popes (or priests); the other, which admits no priest or other clerical functionary. The P. are of the latter class; and they not only themselves refuse all priestly ministrations, but they regard all such ministrations—baptism, marriage, sacraments—as invalid; and they rebaptise all who join their sect from other Russian communities. All their own ministerial offices are discharged by the Starik, or parish elder, who for the time takes the title of pope, and is required to observe celibacy. Among the P. the spirit of fanaticism at times has run to the wildest excesses. They refuse oaths, and decline to enter military service; and having, on account of this, and many other incompatibilities of the system with the Russian practice, encountered much persecution, they resolved to emigrate. Accordingly, in 1700, under the leadership of Philip Pustoswiät, they settled partly in Polish Lithuania, partly afterwards in East Prussia, where they still have several small settlements with churches of their own rite. They are reported to be a peaceable and orderly race. Their principal pursuit is agriculture.

PHILIPPPOPOLIS. See SUPPLEMENT in Vol. X.
PHILIPPSBURG, a town of Baden. See SUPPLEMENT in Vol. X.

PHILIPS, AMBROSE, was born in Shropshire in 1675. He studied at St John's College, Cambridge, and took his degree of M.A. in 1700. In 1709 his Pastorals appeared, along with those of Pope, in *Tonson's Miscellany*; and the same year, having gone on a diplomatic mission to Copenhagen, he addressed from thence a 'Poetical Letter' to the Earl of Dorset, which was published, with a warm eulogium from Steele, in the *Tatler*. In 1712, he brought on the stage *The Distressed Mother*, a tragedy adapted from Racine's *Andromaque*, which had great success. He subsequently wrote two other tragedies, but they proved failures. Some translations from Sappho, which appeared in the *Spectator*, added greatly to P.'s reputation, but Addison is believed to have assisted in these classic fragments. Some exaggerated praise of P. having appeared in the *Guardian*, Pope ridiculed his Pastorals in a piece of exquisite irony, which led to a bitter feud between the poets. P. even threatened personal chastisement, and hung up a rod in Button's Coffee-house, but no encounter took place. One of the names fastened upon P. was that of 'Namy Pamby,' arising from a peculiar style of verse adopted by him in complimentary effusions, consisting of short lines and a sort of infantine simplicity of diction, yet not destitute of grace or melody. The accession of the House of Hanover proved favourable to the poet; he was appointed paymaster, and afterwards a commissioner of the lottery; and going to Ireland as secretary to Archbishop Boulter, he became secretary to the Lord Chancellor, M.P. for Armagh, and registrar of the Prerogative Court. He died in 1749. P. is somewhat conspicuous in literary history from the friendship of Addison and the enmity of Pope; but his poetry, wanting energy and passion, has fallen out of view.

PHILIPSTOWN, a market and post town (formerly the assize town) of King's County, province of Leinster, Ireland, 47 miles south-west from Dublin. Its charter dates from 1567; and in the reign of James II. it obtained the privilege of sending two members to parliament. This privilege was withdrawn at the Union. It is at present, and has long been a place of hardly any trade and entirely without manufacture, and the town has fallen still more into decay since the withdrawal of the assizes (1838) to the neighbouring and more flourishing town of Tullamore. Pop. in 1871, 820, principally Catholics; in 1881, 829.

PHILISTINES (*LXX.*, *Allophuloi*, Strangers), a word either derived from a root *phalasa* (*Æth.*), to emigrate, wander about, or identified with *Pelagis* (q. v.), or compared by others with *Shefela* (Heb.), lowlanders; designates a certain population mentioned in the Bible as being in frequent contact with the Jews, and who lived on the coast of the Mediterranean, to the south-west of Judæa, from Ekron towards the Egyptian frontier, bordering principally on the tribes of Dan, Simeon, and Judah. Our information about the origin of the P. is extremely obscure and contradictory. The genealogical table in Genesis (x. 14) counts them among the Egyptian colonies (the 'Casluhim, out of whom came Philistim'); according to Amos ix. 7, Jeremiah xlvii. 4, and Deuteronomy ii. 23, they came from Caphtor. But supposing that the Casluhim were some separate tribes, and yet Caphtorian colonists, the question still remains, whether Caphtor can be identified with Cappadocia in Asia Minor, as the early versions (*LXX.*, *Targ.*, *Pesh.*, *Vulg.*)

have it; or whether it be Pelusium, Cyprus, or the Isle of Crete. The latter opinion seems not the least probable among them. At what time they first immigrated, and drove out the Canaanitish inhabitants, the Avvim, is difficult to conjecture. They would appear to have been in the country as early as the time of Abraham; and in the history of Isaac, Abimelech, king of Gerar, is distinctly called king of the Philistines. Yet, even supposing that in Genesis the country is designated by the name which it bore at a later period, there can yet be no doubt of the people being firmly established at the time of Moses (Exodus xv. 14, &c.). Thus the date of their immigration would have to be placed at about 1800 B.C. At the Exodus, Moses, evidently fearing an encounter with the warlike colony for his undisciplined band, did not choose the shorter way to Canaan through their territory, but preferred the well-known circuitous route. At a later period, however, Joshua, having triumphed over 31 Canaanite princes, also conceived the plan of making himself master of the possessions of the P.; but his intended disposal of their country for the benefit of the tribe of Judah was never carried out. At this time, they were subject to five princes (Seranim = axes, pivots), who ruled over the provinces of Gaza, Ashdod, Askalon, Gath, and Ekron. Not before the period of the Judges did they come into open collision with the Israelites; and the strength and importance in which they suddenly appear then, contrast so strangely with their insignificance at the time of the patriarchs, that many theories—a double immigration principally—have been propounded to explain the circumstance. We find them daring powerful nations like the Sidonians, whom, about 1209 B.C., they forced to transfer their capital to a more secure position on the island of Tyre; or the Egyptians, with whom they engaged in naval warfare at the same time, under Rameses III. With the Israelites their war assumed the air of guerrilla raids, sometimes into the very heart of the country. Under Shamgar (about 1370 B.C.), they were repulsed, with a loss of 600 men; however, about 200 years later, the Israelites were tributary to them, and continued to groan under their yoke, with occasional pauses only, until Samson first commenced to humiliate them. But they were still so powerful at the time of Eli, that they carried away the ark itself. Under Samuel, their rule was terminated by the battle of Mizpah. Saul was constantly engaged in warding off their new encroachments, and at Gilboa, he and his sons fell in a disastrous battle against them. At this time, they seem to have returned to their primitive form of a monarchy, limited, however, by a powerful aristocracy, the king's formal title again being 'Abimelech' = 'Father-king,' as we find it in Genesis. David succeeded in routing them repeatedly; and under Solomon their whole country seems to have been incorporated in the Jewish empire. The internal troubles of Judæa emboldened the P. once more to open resistance. Under Joram, in union with the Arabians, they invaded Judæa, and not only carried away the royal property, but also the serail and the royal children. Uzziah, however, recovered the lost ground; he overthrew them, and dismantled some of their most powerful fortresses—Gath, Yabne, and Ashdod, and erected forts in different parts of their country. Under Ahaz, they rose again, and attacked the border-cities of the 'plain' on the south of Judah; and a few years later, renewed their attacks, in league with the Syrians and Assyrians. Hezekiah, in the first years of his reign, subjected their whole country again, by the aid of the Egyptians, whom we find in the possession of five cities. The Assyrians, however, took Ashdod, under Tartan,

which was retaken again by Paammetich, after 29 years' siege. About this time, Philistæa was traversed by a Scythian horde on their way to Egypt, who pillaged the temple of Venus at Askalon. In the terrible struggles for supremacy which raged between the Chaldeans and Egyptians, Philistæa was the constant battle-ground of both—her fortresses being taken and retaken by each of them in turn; so that the country soon sank into ruin and insignificance. Yet a shadow of independence seems to have been left to it, to judge from the threats which Zechariah (ix. 5), after the exile, utters against Gaza and Askalon, and their pride. In the time of the Maccabees, the P. were Syrian subjects, and had to suffer occasionally from the Jews, although intermarriages between the two nations were of no rare occurrence. Alexander Balas transferred part of the country to Judæa; another part was taken by Alexander Jannæus; Pompey incorporated some of the cities with Roman Syria; Augustus transferred another portion to Herod; and finally, Salome, his sister, received a small principality of it, consisting of Jamnia, Ashdod, and Askalon. But by this time the name of the country had long been lost in that of Palestine, which designated all the territory between the Lebanon and Egypt.

Of their state of culture, institutions, &c., we know very little indeed. They appear as a civilised, agricultural, commercial, and warlike nation. They traded largely, and their wares seem to have been much sought after. Their worship was much akin to that of the Phœnicians—a nature-religion, of which Dagon, Ashtaroth, Baalzebub, and Derecto were the chief deities. Priests and soothsayers abounded; their oracles were consulted even by people from afar. They carried their charms about their persons, and their deities had to accompany them to the wars. They do not seem to have practised circumcision. As to their language, so little is known about it, that conjectures seem more than usually vain. Those who take them to have been Semites, conclude that their language, too, was Semitic; others, who would identify them with the Pelasgians, differ also respecting their language. Thus much is certain, that their proper names, as they are recorded in the Bible, are mostly Semitic, and that there always remained a difference of dialect between the Hebrew and the Philistean idiom.

The name of Philistines is given by German students to all non-students in general, and the citizens of the special university-place in particular.

PHILLIP, JOHN, R.A., was born, 22d May 1817, at Aberdeen. At a very early age he gave indication of the talent which afterwards so distinguished him; and before he had attained his fifteenth year, had painted various pictures shewing his feeling for colour. He thus procured an introduction to the late Lord Panmure, by whom he was enabled to go to London to pursue his studies. He began by copying from the Elgin marbles at the British Museum, and after a few months was admitted as a student at the Royal Academy.

All his early subjects were of Scotch character, such as a 'Scotch Fair,' 'Baptism in Scotland,' a 'Scotch Washing,' 'The Offering,' &c. In the year 1851 he went to Spain in search of health, which he found, and with it a change in the character of his subjects. On his return home he established himself at the head of the painters of the habits and customs of the Spanish people. In 1853 he exhibited at the Royal Academy 'Life among the Gipsies at Seville.' His pictures for 1854—1855, 'A Letter Writer of Seville,' and 'El Paseo,' were both purchased by Her Majesty the Queen. In 1857 he attained the rank of Associate of the Royal

Academy, and the following year exhibited a most powerful picture of 'Spanish Contrabandistas,' which was purchased by the late Prince Consort, of whom he also painted a portrait the same year for the town-hall of his native city. In 1859, he received the full honour of Royal Academician. His work for exhibition in 1860 was certainly the most difficult he had yet tried, and his success was proportionably great. 'The Marriage of the Princess Royal' was pronounced by both his fellow-artists and the public as a decided success. His next portrait subject (exhibited 1863) was, if possible, a still more difficult task, being the 'House of Commons,' 1860, containing upwards of thirty portraits of the leading members of both sides of the House; in it he was equally successful. However much he excelled in portraiture, his heart was more in his Spanish subjects, of which he had in progress more works (the fruits of his last two visits to Spain) than he perhaps lived to complete, having died in 1867.

The characteristics of Mr P.'s style are rich powerful colour, broad light and shade, strong bold outline, and great variety and truthfulness of texture; no contemporary artist had more power over his brush, or produced a greater effect on the colorists of the present British school.

PHILO JUDÆUS, the *Philosopher* (there being another Jewish Greek writer of this name), was born at Alexandria, about the time of the birth of Christ. Belonging to one of the most wealthy and aristocratic families—his brother was the Alabarch Alexander—he received the most liberal education; and, impelled by a rare zeal for learning, he, at a very early age, had passed the ordinary course of Greek studies which were deemed necessary for one of his station. Although every one of the different free sciences and arts included in the *Encyclica*, he says, attracted him like so many beautiful slaves, he yet aimed higher, to embrace the mistress of them all—Philosophy. Metaphysical investigation was the only thing which, according to his own confession, could give him anything like satisfaction or pleasure. The extraordinary brilliancy of his style, which, by his contemporaries, was likened to that of Plato—his rare power of thought and imagination, and an erudition which displayed the most astonishing familiarity with all the works of the classical Greek poets and philosophers, while at the same time it made him an adept in the fields of history, geography, mathematics, astronomy, physiology, natural history, music, &c.—could not but be of vast influence both upon his co-religionists and those beyond the pale of his ancestral creed. He had completely mastered the literature of his nation; but, strange to say, he chiefly knew it, as far as it was Hebrew, from translations. Thus, the Bible was only familiar to him through the Septuagint version, with all its shortcomings. When about 40 years of age, he went to Rome as the advocate of his Alexandrian brethren, who had refused to worship Caligula in obedience to the imperial edict. He has left an account of this embassy, into the result of which we need not enter here. Of his life we know little except what is recorded above, and that he once went to Jerusalem. His second mission to Rome, to the Emperor Claudius, on which occasion he is said to have made the acquaintance of the Apostle Peter, as reported by Eusebius, is doubtful.

The religious and philosophical system of P., however, which is really the thing of most consequence, is most minutely known, and is deserving of the profoundest study, on account of the vast

influence which it has exercised both on the Jewish and Christian world. To understand his system aright, it will be necessary to remember the strange mental atmosphere of his days, which we have endeavoured briefly to sketch in our introduction to Gnostics (q. v.). The Alexandrines had endeavoured to make Judaism palatable to the refined Greeks, by proving it to be identical with the grandest conceptions of their philosophers and poets, and had quite allegorised away its distinctive characteristics. P. was the first man who, although himself to a great extent imbued with allegorising tendencies, made a bold and successful stand against a like evaporation of the revealed religion of his fathers: which, indeed, in many cases had led people to throw off its yoke also outwardly. A most zealous champion of Judaism, his bitterness in rebuking those co-religionists who tried to defend their secret or overt apostasy by scoffing at the Law itself, who were 'impatient of their religious institutions, ever on the look-out for matter of censure and complaint against the laws of religion, who, in excuse of their ungodliness, thoughtlessly argue all manner of objections'—knows no bounds. He cannot understand how Jews, 'destined by divine authority to be the priests and prophets for all mankind,' could be found so utterly blind to the fact, that that which is the position only of a few disciples of a truly genuine philosophy—viz., the knowledge of the Highest, had by law and custom become the inheritance of every individual of their own people; whose real calling, in fact, it was to invoke the blessing of God on mankind, and who, when they offered up sacrifices 'for the people,' offered them up in reality for all men.

To P., the divinity of the Jewish Law is the basis and test of all true philosophy. Although, like his contemporaries, he holds that the greater part of the Pentateuch, both in its historical and legal portions, may be explained allegorically, nay, goes so far even as to call only the Ten Commandments, the fundamental rules of the Jewish theocracy, direct and immediate revelations, while the other parts of the Book are owing to Moses: he yet holds the latter to be the interpreter specially selected by God, to whose dicta in so far also divine veneration and strict obedience are due; and again, although many explanations of a metaphysical nature could be given to single passages, yet their literal meaning must not be tampered with. This literal meaning, according to him, is the essential part, the other explanations are mere speculation—exactly as the Midrash and some Church Fathers hold. Only that allegorical method differed in so far from that of his contemporaries, that to him these interpretations—for which he did not disdain sometimes even to use the numbers symbolically, or to derive Hebrew words from Greek roots, and the like—were not a mere play of fancy, in which he could exercise his powers of imagination, but, to a certain extent, a reality, an inner necessity. He clung to philosophy, as combined with the Law. If the former could be shewn, somehow or other, to be hinted at in the latter, then only he could be that which all his soul yearned to be—viz., the disciple of both; a Greek, with all the refinement of Greek culture; and a Jew—a faithful, pious, religious Jew. Nay, he even urged the necessity of allegory from the twofold reason of the anthropomorphisms current in Scripture and from certain apparent superfluities, repetitions, and the like, which, in a record that emanated from the Deity, must needs have a special meaning of their own, which required investigation and a peculiar interpretation. See MIDRASH, HAGGADA. Yet this fanciful method never for

one moment interfered with his real object of pointing out how Judaism most plainly and unmistakably was based upon the highest ethical principles.

His writings develop his ideas and his system in the two directions indicated. In that division of his writings principally, which treats of the Creation (*Kosmopoia*), he allows allegory to take the reins out of his hands; in that on the Laws (*Nomoi*), on the other hand, he remains remarkably sober and clear, extolling the Mosaic legislation throughout, at the expense of every other known to him. In a very few instances only he is induced to find fault, or to alter slightly, by way of allegory, the existing ordinances.

His idea of God is a pre-eminently religious, not a philosophical one. He alone is the real Good, the Perfect; the world has only an apparent existence, and is the source of all evil. God is only to be imagined as the primeval light, which cannot be seen by itself, but which may be known from its rays, that fill the whole world. Being infinite and uncreated, He is not to be compared with any created thing. He has therefore no name, and reveals Himself only in designations expressive of this 'inexpressibility.' He is also named the Place (the talmudical *Makom*), because He comprises all space, and there is nothing anywhere besides Him. He is better than Virtue and Knowledge, better than the Beautiful and the Good (*Kalokagathia*), simpler than the One, more blissful than bliss. Thus, He has, properly speaking, no quality, or only negative ones. He is the existing Unity or Existence itself (*Ōn*, or *Ōn*), comprised in the unpronounceable Tetragrammaton. As Creator, God manifests Himself to man, and He is then called 'The Beginning, the Name, the Word, the Primeval Angel.' In this phase of active revelation of God, which is as natural to Him as burning is to the heat, and cold to the snow, we notice two distinct sides, the Power and the Grace, to which correspond the two names of Elohim and Adonai, used in the Bible. The Power also gives the laws, and punishes the offender; while the Grace is the beneficent, forgiving, merciful quality. Yet, since there is not to be assumed an immediate influence of God upon the world, their respective natures being so different, that a point of contact cannot be found, an intermediate class of beings had to be created to stand between both, through whom He could act in and upon creation—viz., the spiritual world of ideas, which are not only 'Ideals,' or types, in the Platonic sense, but real, active powers, surrounding God like a number of attendant Beings. They are His messengers, who work His will, and by the Greeks are called good demons; by Moses, angels. There are very many different degrees of perfection among them. Some are immediate 'serving angels;' others are the souls of the pious, of the prophets, and the people of Israel, who rise higher up to the Deity; others, again, are the heads and chief representatives of the different nations, such as Israel does not need, since they conceive and acknowledge the Everlasting Head of all beings, Himself. The *Logos* comprises all these intermediate spiritual powers in His own essence. See article *Logos* for P.'s views on this part of his system. Man is a microcosm, a little world in himself, a creation of *Logos*, through whom he participates in the Deity, or, as Scripture has it, 'he is created in the image of God.' He stands between the higher and lower beings—in the middle of creation. The ethical principles of Stoicism, P. identified with the Mosaic ethics, in which the ideal is most exalted moral perfectibility or sanctity, and man's duties consist in veneration of God, and love and righteousness towards fellow men. P.

holds firmly the belief in immortality. Man is immortal by his heavenly nature; but as there are degrees in his divine nature, so there are degrees in his immortality, which only then deserves this name when it has been acquired by an eminence of virtue. There is a vast difference between the mere living after death, which is common to all mankind, and the future existence of the perfect ones. Future recompense and punishment are not taken by him in the ordinary sense of the word. Virtue and sin both have all their rewards within themselves; but the soul, which is 'pre-existing,' having finished its course in the sub lunar world, carries this consciousness with it in a more intense and exalted manner. Paradise is Oneness with God; there is no hell with bodily punishments for souls without a body, and no Devil in the Philonic system.—Philo's Messianic notions are vague in the extreme, and he partly even interprets certain scriptural passages alluding to some future Redeemer as referring to the soul. Yet he indicates his belief in a distant time when some hero will arise out of the midst of the nation, who will gather all the dispersed together; and these, purified by long punishments, will henceforth form a happy, sinless, most prosperous community to which all the other nations will be eager to belong.

We have only been able to indicate, in the slightest of outlines, the principal features of P.'s theology and philosophy, without endeavouring to follow any one of the manifold systematic schemes into which his scattered half-obscure dicta have been pressed. The influence P. has exercised upon Christianity and Judaism (in the later writings of which his name occurs as 'Yedidyah the Alexandrine') is enormous, and the various articles in the course of this work (GNOSTICISM, JEWS, *Logos*, &c.) dwell more or less upon this point. What he has done for the development of Philosophy, is discussed under that head, and in the articles PLATO, NEO-PLATONISM, &c. Of the many works left under his name, several have been declared spurious, but in some cases, without much show of reason. His writings are generally brought under three chief divisions, the first of which comprises those of a more general and metaphysical nature, such as, *De Mundi Incorrumpibilitate*, *Quod Omnis Probus Liber, De Vita Contemplativa*. The second contains those written in defence of his compatriots, *Adversus Flaccum, Legatio ad Caicum, De Nobilitate*. The third and most important is devoted to the interpretation and explanation of Scripture in the philosophical manner indicated, *De Mundi Opificio, Legis Allegoriarum Libri III.*; containing also a number of special treatises, *De Circumcisione, De Monarchia, De Præmiis Sacerdotum, De Posteritate Caini, De Cherubim*, &c.; five books *On the History of Abraham, De Josepho, Vita Mosis, De Caritate, De Penitentia*, &c.; to which also belong *De Parentibus Colendis, De Virtute eiusque Partibus*, first published by A. Mai; and certain very doubtful fragments, first discovered in an Armenian translation, such as *De Providentia* and *De Animalibus*, &c. Many of his works, however, seem irredeemably lost. The *editio princeps* by Turnebus, dates Paris, 1552; reprinted Geneva, 1613; Paris, 1640; &c. Mangey published a more critical edition (Lond. 1742, 2 vols. fol.), and Richter a slightly improved one (Leip. 1828—1830, 8 vols.). An edition of Pfeiffer (1785, &c.) remained incomplete. Another edition was published by Tauchnitz (1851, &c.). As yet, there are several codd. in the Escorial, in Rome, in St Petersburg, which have never been collated, and which promise, to judge from the few readings known, to furnish an immense

help for that really critical edition, which as yet is a desideratum.—Of the scholars who have written on P., we mention principally Dahl, Bryant, Gröner, Creuzer, Grosmann, Wolff, Ritter, Beer, &c. The English translation of P. in 4 vols., forms part of Bohn's *Ecclesiastical Library*.

PHILOLOGY. This word, as a technical name for a branch of knowledge, has gone through various phases of meaning. Originally signifying the love of talk or discourse, and then, in a more restricted sense, the love of philosophical conversation such as is exhibited in the dialogues of Plato, it came, in the later period of Greek literature, to mean the study and knowledge of books, and of the history and other science contained in them. In this sense it passed over to the Romans, under whom the name of philologists was applied to men distinguished for universal learning, more especially to the *grammatici*, whose chief occupation of editing and illustrating the classic poets, naturally led them to this multifarious knowledge; and when Martianus Capella (q. v.) in the 5th c. composed his *Encyclopædia* (q. v.) or curriculum of education, embracing the 'seven liberal arts' (Grammar, Dialectic, Rhetoric, Music, Arithmetic, Geometry, and Astronomy), he designates the collective whole by the name of philology. What is known as the Revival of Literature after the dark ages, is nothing else than the revival of the ancient philology. But when men, instead of looking only at what had been written, began to examine the world for themselves, and enlarge the bounds of science, it became impossible for one man to cultivate the whole round of knowledge, and the term philology was by degrees restricted to a knowledge of the languages, history, laws, &c. of the ancient world (by which the Greek and Roman world was chiefly thought of), or, more narrowly still, to the study merely of the languages—of grammar, criticism, and interpretation. A more complete conception of philology, as an independent branch of knowledge, was that of F. A. Wolf, who assigned as its field all that belongs to the life of the ancient peoples; and the conception is still further extended by Böckh, who makes it almost synonymous with history—its problem being the reproduction of the past; in this sense, the word is applicable to all peoples at all periods of their history, so that we are beginning to have an Indian philology, a German philology, a Slavic philology, no less than a classic philology. The fullest and most systematic exposition of what philology in this sense ought to embrace, has been given by G. Haase in Ersch and Gruber's *Ency.*, 3d sect., vol. xiii.

Of philology, even in its widest sense, the study of language was always, and necessarily, a fundamental part; and, in the usual sense of the word, it has been the chief part—often nearly the whole. For a long time after the revival of learning, the classic writers were studied chiefly for their language and style, and those of them that did not come up to an imaginary standard of purity were despised and neglected, however valuable they might be for their matter. But although great and even undue attention was thus given to language, it was only as an instrument, as means to an end. The philologist studied a language in order to be able to understand it and use it—to get at the thoughts conveyed in it, or to convey his own thoughts with force and elegance to others. This is the object of the grammars, dictionaries, annotated editions, and criticisms, which constitute the chief part of philological literature. But within recent years, philology has entered upon a new phase, or rather a new study has sprung up alongside of the old. As the naturalist investigates a class of objects not with a view to turn them to use, but to understand

their nature, and classify them; so the new school of philologists examine and compare the structures of the various languages, and arrange them in classes and families, with the ultimate view of arriving at some theory of language in general—its mode of origin and growth. The comparison of the structure of two or more languages is called Comparative Grammar, and the whole of this new branch of study is sometimes designated as Comparative Philology; but it seems better to leave the old field in possession of the old name, and in contradistinction to philology as the practical knowledge of languages, to speak of the study of language as a phenomenon *per se*, as the Science of Language. The German term *Sprachenkunde*, and the French *Linguistique*, have more especial reference to the naturalist, or classificatory aspect of the study.

So long as the view prevailed that language was a human invention, anything like a science of it was impossible. According to that view, which was early started, and was especially elaborated and discussed by Locke, Adam Smith, and Dugald Stewart, it was only after men found that their rapidly increasing ideas could be no longer conveyed by gestures of the body and changes of the countenance, that they set about inventing a set of artificial vocal signs, the meaning of which was fixed by mutual agreement. On this theory, there might be a history of the subsequent course of the different languages, but inquiries into the nature and laws of language after the manner of the physical sciences would be absurd. In opposition to the philosophers who attributed the origin of language to human invention, some theologians claimed a divine origin for it, representing the Deity as having created the names of things, and directly taught them to Adam. Both these theories may now be considered as given up by all who are entitled to speak on the subject. Everything, in fact, tends to shew that language is a spontaneous product of human nature—a necessary result of man's physical and mental constitution (including his social instincts), as natural to him as to walk, eat, or sleep, and as independent of his will as his stature or the colour of his hair.

Language was an object of speculation among the Greek philosophers; but as was the case with their inquiries into the outward world generally, they began at the wrong end; they speculated on the origin of things before they had examined the things themselves. They knew no language but their own, and all others were indiscriminately classed as 'barbarous' or foreign; they had no test of affinity among tongues except mutual intelligibility. The theories of the modern philosophers of the 18th c. were nearly as baseless; they were mere *à priori* speculations, akin to Burnet's (q. v.) 'theory of the earth,' which was constructed before the strata of the earth's crust had been explored. The great obstruction to the true course of inquiry was the assumption, first made by the Church Fathers, and for a long time unquestioned, that Hebrew was the primitive language of man, and that therefore all languages must be derived from Hebrew. A prodigious amount of learning and labour was wasted during the 17th and 18th centuries, in trying to trace this imaginary connection. Leibnitz was the first to set aside this notion, and to establish the principle that the study of languages must be conducted in the same way as that of the exact sciences, by first collecting as many facts as possible, and then proceeding by inductive reasoning. It was owing to his appeals and exertions that missionaries, travellers, and others, now began making those collections of vocabularies and specimens of languages and dialects which form the *Herbarium*,

as it were, of human speech. A valuable Catalogue of Languages in six volumes was published in Spanish in 1800, by Hervas, a Jesuit missionary. It contains specimens and notices of more than 300 languages, and many of the true affinities are happily traced. A similar work was Adelung's *Mithridates* (4 vols. Berlin, 1806—1817), based on the catalogue of Hervas, and also on the collections which the Russian government had caused to be made. In none of these efforts, however, although much truth was struck out, were there anything like fixed principles of scientific classification. The light that brought order into the chaos rose with the study of Sanscrit (q. v.), first made accessible to European scholars by Sir William Jones, Colebrooke, and other members of the Asiatic Society, founded in Calcutta in 1784. The similarity of Sanscrit to Greek and Latin, especially in the grammatical forms, struck every one with surprise. Sir William Jones declared that 'no philologist could examine the Sanscrit, Greek, and Latin without believing them to have sprung from the same source, which perhaps no longer exists. There is a similar reason, though not quite so forcible, for supposing that both the Gothic and the Celtic had the same origin with the Sanscrit. The old Persian may be added to the same family.' Rather than admit this relation, which it was seen would involve also ethnological affinities, some, as Dugald Stewart, denied that Sanscrit had ever been the language of a people, and held that it was an invention of the Brahmins, who had constructed it on the model of the Greek and Latin. Fr. Schlegel's work, *On the Language and Wisdom of the Indians* (1808), although defective and erroneous in point of scholarship, has the merit of boldly embracing the languages of India, Persia, and Europe in one family group, by the comprehensive name of Indo-Germanic. It was this work that called the attention of German scholars to a field of labour which they have since made specially their own.

The successive publications of Bopp (q. v.), beginning in 1816, and culminating in his great work on the grammar of the Aryan languages, *Vergleichende Grammatik* (Berl. 1833—1852; a 2d ed. recast and enlarged, 3 vols., Berl. 1857; an English translation of 1st ed. was published in 3 vols., 1845—1850, and, revised, in 1854), created the new science of Comparative Grammar, and laid a sure and broad foundation for the science of language generally. Concurrent with the labours of Bopp, were those of Pott in his *Etymological Researches* (*Etymologische Forschungen*, 2 vols., 1833—1836; 2d ed. 1859) and other works. Not less important, though confined to one stock of the Aryan family, the Teutonic, was the great German Grammar (*Deutsche Grammatik*, 4 vols. 1818—1837) of J. Grimm (q. v.). William von Humboldt (q. v.) did much to establish a philosophy of language—the relations and interactions of mind and speech; a department of the subject which has been further cultivated in recent years by Steinthal. The method of investigation, thus invented and perfected in the field of the Aryan tongues, has been applied to other languages and considerable progress has been made in grouping the principal varieties of human speech into families, which again fall into subdivisions or branches, according to the different degrees of nearness in the relationship. In establishing these relationships, although a comparison of the vocabularies—the numerals, pronouns, and more essential nouns and verbs—may establish a general affinity, and render a common origin probable; yet the surer test lies in the grammatical forms. For when those elements of a language which express the relations of things—case, number, tense—have

once become mere terminations, and lost their original form and independent meaning, they can only be transmitted by tradition; and when the same grammatical forms are found possessed in common by two or more tongues, they must be an inheritance from a common ancestor. It follows from this that the 'genealogical' classification, as it is called, cannot be carried out with great surety or rigour except in the case of languages in which grammatical forms had become in some degree fixed before their divergence—in other words, of the inflectional languages. Accordingly, the only two well-defined genealogical families are the Aryan and the Semitic, which embrace the whole of the languages of the inflectional type.

Besides the division of languages into families bearing traces of a common origin, there is a division into three orders, as they may be called, depending upon a radical difference of structure. Speech, as the expression of thought, contains two elements: ideas or conceptions, which constitute the substance or material part; and the relations of these ideas to one another, which constitute the formal part; and the nature of a language depends upon the particular way in which the vocal expression of these two elements is combined. At the foundation of all words lie Roots (q. v.), or simple sounds expressive of meaning. Now, some languages, as the Chinese (q. v.), use these roots in their naked form as words, the same syllable, according to its position, serving as noun, adjective, verb, &c.—e. g., *ta* means great, greatness, to be or to make great, greatly or very. The relational part of the thought, for the most part, gets no vocal expression, it is only indicated by position, as when *min*, people, and *li*, power, are simply put together (*min li*) to signify the people's power. Relations not readily indicated by position are expressed in a round-about way by using additional significant words: thus, *tschung* (mass or multitude) *jin* (man) = men; *niu* (woman) *tee* (child) = daughter; *y min li* (employ people power) = with the people's power. Even in such cases, each root preserves its independence, and is felt to express its own radical meaning. Languages like the Chinese, whose development has been arrested at this rudimentary stage, are called *Monosyllabic* or *Isolating*.

The next stage of development is that of the *Agglutinate* languages, which are by far the most numerous, including the Turanian and American families. In these, the relational part of thought obtains prominent vocal expression by separate roots joined or *glued* on to the significant roots as terminations. These terminations were originally themselves significant roots, and many of them are still used as separate significant words, although the greater part have sunk down to mere signs of cases and other relations. The compound expression thus formed never, however, attains perfect unity; the significant root always remains rigid, unobscured in its sense and unchanged in form, and the termination is felt as something distinct from the body of the word.

Thus, the Finnish declension exhibits a structure of the most mechanical and transparent kind—e. g., *karhu*, bear; *karhu-n*, of the bear; *karhut-ta*, without bear; *karhu-sta*, out of the bear; and so on through fifteen cases. The insertion of the plural suffix, *i*, gives *karhu-i-n*, of the bears; *karhu-i-ta*, without bears; *karhu-i-sta*, out of the bears; &c. But this composite mechanical structure reaches its climax—remaining all the while perfectly transparent—in the Turkish verb. Thus, the root *sev* has the indefinite meaning of loving, and the inf. is *sev-mek*, to love; which then, by the insertion of certain suffixes, can take on as many as forty forms or voices—e. g., *sev-me-mek*, not to love; *sev-e-me-mek*

not to be able to love; *sen-dir-mek*, to cause to love; *sen-dir-ish-mek*, to cause one another to love; *sen-il-mek*, to be loved; *sen-il-e-me-mek*, not to be able to be loved, &c. Each of these forms, then, runs through a large round of tenses and moods, with their persons and numbers.

The languages of the American Indians are all of this agglutinating type, although they have also got the name Incorporative, or Intercalative, because they run a whole phrase or sentence into one word—e.g., *hoponi*, to wash; *hopocuni*, to wash hands; *hopoaduni*, to wash feet; *ninacaqua*, I (*ni*) eat (*qua*) flesh (*naca*). The Basque language partakes of this character.

It is only in the third or *Inflectional* stage that perfect unity of the two elements is attained. In the Aryan and Semitic tongues, which alone have reached this highest state of development, the significant root and the termination have become blended into one both in effect and form, and phonetic changes have for the most part obliterated the traces of composition. Yet no doubt is felt by philologists that the most highly organised of the inflecting or amalgamating languages began with the radical stage, and passed through the agglutinate. The analytic powers of comparative grammar have succeeded in tracing back the formal elements of the Aryan tongues to original independent words, agglutinated to other words to modify them. See INFLECTION. Against this theory it has been urged, that there is no historical instance of a language so changing its type, and passing from one stage to another. But a sufficient account of this phenomenon may be found in the different mental habits and political positions of the peoples (see Max Müller, *Lectures on the Science of Language*, First Series, page 316). Besides, the languages of the lower types do shew a tendency, under favourable circumstances, to produce grammatical forms of the higher kind. Even in Chinese, in some of its modern dialects, something like cases is to be seen; and Finnish and Turkish, in contact with the inflected languages of Europe, are making approaches to the inflectional type.

On the other hand, the inflectional languages had, before the earliest times of which we have any written monuments, entered on the reverse phase—the *analytic*. By the process of phonetic change and decay, the grammatical forms have been gradually becoming obliterated and losing their power, and their place has been supplied by separate words, in the shape of prepositions and auxiliary verbs. See INFLECTION.

Connected with these radical differences of type, is one of the higher and more speculative problems of the science—the question as to the common origin of all languages. The inherent and apparently ineffaceable difference of structure in the three orders above described, as well as the absence of all sure marks of genealogical affinity even between the two families of the inflectional type, the Aryan and the Semitic, are considered by some as insuperable objections to the theory of a common origin. But although it may be fruitless to look for extensive identifications of the roots and grammatical forms of the Aryan tongues, even in the oldest forms to which we can trace them, with those of the Semitic, still more with Chinese or Turkish elements; it seems rash and unscientific to affirm that, going back to the radical stage, the development of all could not have begun from a common stock of monosyllabic roots. The wonderful transformations exhibited by language in the course of its known history, seem sufficient ground for maintaining the *possibility* of a common origin. On the other hand, the nature of the case forbids all hope

of ever being able to *prove* it; for the coincidences that occur (e.g., Chinese *fu*, Tibetan *pha*, Lat. and Gr. *pa-ter*, Eng. *fa-ther*; Chin. *mu*, Egyp. *mu*, Lat. and Gr. *ma-ter*, Eng. *mo-ther*), even though they were much more numerous than they are, might well arise from the mind and vocal organs of man being everywhere essentially the same.

Languages, like living organisms, are in a state of continual flux or change, and an essential part of the science consists in investigating the laws according to which these changes take place. It is because there are such laws that a science of language is possible. In tracing words to their origin, and identifying them with words in other languages, we are no longer guided by mere similarity of sound; on the contrary, identity of sound is often a proof that a proposed etymology is wrong. It has been established, for instance, by induction (see GRIMM'S LAW), that *c* in Latin is regularly represented by *h* in Gothic and English; while for Gothic or English *c*, the corresponding letter in Latin is *g*. Accordingly, we readily recognise Latin *corn-u* and English *horn* as cognate words; while a suggestion to connect the English *corn* with *cornu*, is immediately rejected. If *corn* has a representative in Latin, it must begin with *g*, which points out *granum* as the word. *Grain* is not the English representative of *granum*; it is *granum*, borrowed from the Latin through the French. The expert etymologist can often identify with certainty two words, although not a letter remains the same. In simple cases, this is done by every one. Who, for instance, doubts that Aberdeenshire *fa*, *filk*, are merely dialectic varieties of Eng. *who*, *which*. Yet the same persons who readily admit such cases, are sceptical when it is proposed, for instance, to identify Fr. *larme*, with Eng. *tear*. The grounds of identification, however, are similar in both instances; the only difference being, that with regard to *larme* and *tear*, they require to be traced historically. No one will dispute that *larme* is a corruption of Lat. *lacrima*; in fact, it can be followed through the successive stages of change. Now we know that the Romans had a peculiarity of letting *d* in some positions degenerate into *l*. Nor is this unaccountable, when we consider that the contact of organs which produces *d*, differs from that which produces *l*, chiefly in being more energetic; a slovenly *d* slides into *l*. Thus the Greek name, *Odysseus*, became, in the mouth of the Romans, *Ulysses*; they said *odor* (a smell), but *oleo* (I smell); and, instead of *impedimentum*, *dedicare*, we sometimes find *impelimentum*, *delicare*. These and other instances would warrant us to conclude that *lacri-ma* was a corruption of *dacri-ma* (corresponding to Gr. *dakru*), even if we had not the express statement of Festus that *dacrima* was the older form. After this there is no difficulty in recognising *dacri*, or *dakru*, as identical with Gothic *tagr*, Eng. *tear*.

In order to give a rational account of the phonetic changes now exemplified, the nature of articulate sounds, and of the organs that produce them, must be carefully investigated. The most valuable contributions, in English, to this important preliminary branch of the study (called *Phonetics*), are those of Mr Alex. J. Ellis. See PHONETIC WRITING. An admirable *résumé* of the subject, with diagrams of the organs of voice in the position of pronouncing the different articulations, is given in the second series of Max Müller's *Lectures on the Science of Language* (1864), where the best recent works on phonetics are noted.

The transformations that words exhibit, as they are traced down the stream of history, are of the nature of phonetic decay, and are due to a natural

tendency to economise muscular energy by pronouncing two syllables in one. The dropping of inflections, the shortening of words by internal elision and otherwise (Fr. *père*, from Lat. *pater*; Eng. *fair*, from A. S. *fæger*; *stranger*, from old Fr. *estranfier*, Lat. *extraneus*), are all owing to the action of this force, and the uniformities observable among such changes, can be explained on physiological principles. Dialectic diversification is not so easily accounted for; it is difficult to say why sister nations—as in the case of the Aryan family, or of the nations speaking Romanic tongues—should have given such different forms to the same stock of primitive roots; why, e. g., Gr. *penē* (Æol. *penpe*), *pepo*, should be in Lat. *quinque*, *coquo*. Max Müller thinks it necessary to go back to a time when many of the articulations were not yet sharply defined; and he appeals, in illustration, to the confusion children make between such sounds as *tat* and *cat*; and, what is still more in point, to the analogy presented by languages like the Polynesian. In the language of the Sandwich Islands, the two consonants, *k* and *t*, run into one another, 'and it seems impossible for a foreigner to say whether what he hears is a guttural or a dental. The same word is written by Protestant missionaries with *k*, by French with *t*. It takes months of patient labour to teach a Hawaiian youth the difference between *k* and *t*, *g* and *d*, *l* and *r*. . . . If colonies started to-morrow from the Hawaiian Islands, the same which took place thousands of years ago, when the Hindus, the Greeks, and Romans left their common home (see ARYAN), would take place again. One colony would elaborate the indistinct, half-guttural, half-dental contact into a pure guttural; another, into a pure dental; a third, into a labial.' Much light is thrown on this question by those phonetic peculiarities—those deficiencies and predilections of articulation which characterise whole tribes and nations, as they often do individuals. They may have originated, perhaps, in the idiosyncrasies of individual ancestors (a lisping patriarch might produce a tribe of lispers, without their inheriting the physical defect which caused the lisp in him), or in a common habit of the organs of speech produced by external circumstances; but once established, they are very persistent and influential. The Mohawks, and several other American tribes, have no *p*, *b*, *m*, *f*, *v*, or *w*; they never articulate with their lips. In Chinese, there is no *d*; *r* is also wanting; and as the habit of the language requires a vowel after every consonant, the nearest approach they can make to the sound of *Christ* is *Ki-li-se-tu*. An analogous habit of articulation transforms the English word *gold* in the mouth of a Kafir into *i-go-li-de*. On this principle can be explained the Fr. *espérer*, from Lat. *sperare*; *établir* or *établis*, from *stabilire*; *école* (*escole*), from *schola*, &c. In the Celtic tongue, an initial *s* with a consonant after it was an unwonted combination; when it would have occurred, a vowel was always prefixed; and, on adopting the Latin language, the Celtic peoples carried their old habit of pronunciation with them. The effects upon a language of thus coming in contact with another, are important elements in its history. See ENGLISH LANGUAGE AND LITERATURE.

The positive part of the science of language having pushed inquiry back until it arrives at monosyllabic roots that admit of no further analysis, there stops, as at the legitimate boundary of its province. It assumes the existence of a certain store of crude or primary matter, and merely concerns itself with how out of this matter the structure

as we know it, has been built or has grown up. But a question yet remains, which, although it can never receive but a conjectural answer, has a wonderful fascination for the speculative mind, and was, in fact, the question with which all inquiries into language began; the question, namely: How did language take a beginning at all? how came this primitive material of language, these significant roots, into existence? The answer may be thus conceived: To speak is a necessity of man's rational and emotional nature; he speaks because he thinks and feels. When the mind receives an impression or intuition, by an instinctive impulse, of the nature of reflex action, some outward expression—a gesture or vocal sound—breaks forth, which by association becomes a sign or symbol, to the individual and to his associates, of the impression or idea that gave it birth. Associated at first with individual impressions and objects, these sounds, by the process of abstraction, which is pre-eminently a human faculty, would gradually come to represent more generalised impressions—would become words, as distinguished from mere animal sounds. The necessity of words to think in is much insisted on by speculators on this subject, as being the motive-power in the generation of language; and no doubt it is true that, without language, thought could advance but little, if at all, beyond what is manifested by the brutes. But when they argue as if this necessity of having his ideas objectively depicted, in order to exercise his own reason, would impel an individual man to construct a language for his own use, they make the unwarranted assumption that, under any circumstances, even though he grew up from infancy in solitude, the thinking powers of a human being must necessarily develop themselves. The necessarily few facts that bear on the case look the other way. Kaspar Hauser (q. v.), instead of elaborating a system of symbols of thought for himself, had forgotten what he had once possessed; his faculties of thought and of speech seem to have been simultaneously arrested. Observation seems to favour the opinion, that man in solitude—if he could exist in solitude—would be as mute as the lower animals. The social nature of man helped to give birth to the germs of speech, no less than his rational nature; an instinctive desire to give a sensible sign of his impressions to his fellows, was perhaps the primary impulse; the aid thus given to his own thinking powers, a secondary result. Be this as it may, it seems reasonable to assume, as it has been well put by Steintal, that 'at the origin of humanity, the soul and the body were in such mutual dependence, that all the emotions of the soul had their echo in the body, principally in the organs of respiration and the voice. This sympathy of soul and body, still found in the infant and the savage, was intimate and fruitful in the primitive man; each intuition woke in him an accent or a sound.'—Farrar, *Origin of Lang.*

Were these sounds, then, guided by chance or caprice? or if not, what determined particular articulations to be associated with particular objects or ideas? Any mystic innate correspondence between sounds and things, is out of the question; but what more reasonable than to suppose that the natural sounds emitted by so many things, animate and inanimate, should suggest the character of the articulations which the ideas of the things called forth—not so as to produce exact imitations, which it is not of the nature of articulate sounds to be, but such resemblances as would suffice for association. See ONOMATOPOEIA. In the case of ideas unconnected with any natural sound, names would readily be suggested in many cases by analogies, real or fancied, with things that were attended by

sounds. We can see, again, a physiological fitness in the articulation *etc.*, to stand; with the idea of stability, still more with the attitude, the organs involuntarily assume the position with which this syllable is emitted. Similar instances might be multiplied. We are not to suppose that the same thing would suggest the same sound to all, or even to the same individual at all times. The language-making faculty in the flush of its spring would throw out a multitude of names for the same thing (synonyms), as well as apply the same name to many different things (homonyms); but by a process of natural elimination, those only would survive that were felt best to answer the purposes of speech. The abstracting faculty would also soon dissociate them from the concrete individual objects that first suggested them, and convert them into symbols of the prominent attributes of whole classes. It is these generalised names, syllables significant of such general simple notions as seeing, moving, running, shining, striking, cutting, or being sharp, that, by a kind of inverse process, became the roots of language as it now exists. A syllable expressive of a single prominent attribute forms the foundation of the names of a whole class of objects, the specific differences being marked by other significant syllables joined on to it. See *Roots*. In some such way, by the unconscious working of man's intellectual nature, we may conceive language to have grown out of the exclamatory or interjectional stage into the rational structure that we now admire. This theory of the origin of roots, together with the constant operation of phonetic change, accounts for the absence of all traces of onomatopoeia in the great bulk of the words of a language, and seems to meet the objections of Max Müller and other philologists to the onomatopoeic theory.

With regard to these primary or radical words it is only necessary to observe here that they are all significant of sensible or physical ideas, and expressions for immaterial conceptions are derived from them by metaphor. How, from a comparatively few roots of this kind, the vocabulary of the richest language may grow, is further illustrated in the article *Root*.

Another speculative question regards the length of time that language must have taken to advance from the rudimentary stage to the state in which it is found in the earliest records. Bunsen assigns 20,000 years as the lowest limit; but it is evident that the same uncertainty must always rest on this question as on the corresponding one in geology.

Separate points of philology will be found treated under a variety of heads. See—besides the articles already referred to—*ALPHABET*; the several letters, *A, B, &c.*; *GENITIVE*; *NOUN*; *ADVERB*; *PRONOUN*; *DIALECT*; *PERSIAN LANGUAGE AND LITERATURE*; *SEMITIC LANGUAGES*; &c.

The literature of the new science of language is already rich; but much of it is scattered through the transactions of societies and periodicals. Of separate works of a comprehensive kind, in addition to those already named, we may mention, in German, Schleicher, *Die Sprachen Europas* (Bonn, 1850), and *Vergleichende Grammatik der Indo-Ger. Sprachen* (2 vols. Weimar, 1861); J. Grimm, *Ueber den Ursprung der Sprache* (Ber. 1852); Diez, *Etymol. Wörterbuch der Romanischen Sprachen* (2d ed. Bonn, 1861), and *Vergleichende Grammatik der Romanischen Sprachen* (3 vols. Bonn, 1836—1842); translations of both works into English have been published by Williams and Norgate (1864). Heyse, *System der Sprachwissenschaft* (Ber. 1856); Steinthal, *Die Classification der Sprachen* (Ber. 1856); and *Der Ursprung der Sprache* (Ber. 1851). In French,

Renan, *Histoire Générale et Système comparé des Langues Semitiques* (3d ed. Paris, 1863); and *De l'Origine du Langage* (3d ed. Paris, 1863); Pictet, *Les Origines Indo-Européennes* (Paris, 1859).

English scholars were late in entering this field of research. Horne Tookes (q. v.) *Diversions of Purley*, though a work of genius, and though it has been the means of first awakening in many an interest in the nature of language, was written without sufficient acquaintance with the kindred tongues, and before the true key to the inquiry had been obtained, and therefore few of the results can now be accepted. Among the first important contributions were Prichard's *Eastern Origin of the Celtic Nations* (Oxf. 1831), and the contributions of the Rev. Richard Garnett to the *Quarterly Review* in 1835—1848. Mr Garnett's essays in the *Quarterly*, and his subsequent papers printed in the proceedings of the London Philological Society (in the formation of which, in 1842, he took an active part), have been reprinted under the title of *Philological Essays* (Williams and Norgate, 1859), and are models of linguistic research. The philological articles of the *Penny Cyclopædia* also contributed to popularise the study in England. Of substantive works, the most important, though bearing more directly on the Greek and Latin tongues, are *The New Cratylus* (1839, 3d ed. 1859), and the *Varronianus* (1844) of J. W. Donaldson (q. v.). Winning's *Manual of Comparative Philology* (1838) had previously given a popular sketch of the affinities of the Aryan languages. Latham's *English Language* (1841—several new editions) treats its subject from the historico-comparative point of view, and therefore comes in some degree within our scope. A valuable work of the same kind is Marsh's *Lectures on the English Language* (New York, 1860). Latham's *Elements of Comparative Philology* (1862) gives an elaborate classification of the languages of the world, with numerous specimens; only a small part of the work (56 pages out of 752) is given to the general principles of the science. Farrar, *On the Origin of Language* (1860), chiefly deals with the speculative part of the subject; he brings within small compass the views of the leading investigators on the more interesting points. But above all, the writings of Max Müller (*Comparative Mythology*, in the *Oxford Essays*, 1856; *Lectures on the Science of Language*, 1861, 1864; *Chips from a German Work-shop*, and *Stratification of Language*) have contributed to make the study of this science take root in Britain.

On the principles of classification above sketched, the chief languages of the earth may be thus arranged:

I. *Monosyllabic or Isolating*.—1. Chinese, the typical language of this order. 2. Tibetan, which shows some beginnings of grammatical forms. 3. The languages of the Eastern Peninsula—Siamese, Anamese, Burman. Japanese and the language of Corea are doubtful.

II. *Agglutinate*.—1. The most important division of this order is the Turanian family, comprising 'all languages spoken in Asia and Europe (including Oceania), and not included under the Aryan and Semitic families, with the exception of Chinese and its cognate dialects.' For the subdivisions of this family, see *TURANIAN LANGUAGES*. 2. *African Languages*.—Some of the languages of Africa are allied to the Semitic family, and were introduced by immigration, such as the dialect of Tigré in Abyssinia (see *ETHIOPIA*), and the Arabic dialects spoken by the Mohammedan population of the coasts, and which have even penetrated deep into the interior. How far the Berber dialects are of Semitic character, is a disputed question; and the same is the case with the language of the Gallas in

Abyssinia. Little has as yet been done in investigating and classifying the native Agglutinate languages of Africa, which have been designated by the common name of Hamitic. The ancient Egyptian, from which the modern Coptic is derived, would seem never to have got beyond the isolating stage (see **HIEROGLYPHICS**). Some of the languages adjoining Egypt are thought to be allied to the Coptic. The negro languages, properly so called, of the Sudan, and of the west coast from the Senegal to the Niger, are exceedingly numerous and widely diverse. The languages to the south of the equator are markedly different from those to the north. They fall, according to some, into two great families, the Congo family on the west, and the Kafir family on the east. The Hottentot language is distinct from both. A valuable contribution has recently been made to the study of part of the field by

Bleek's *Comparative Grammar of the South African Languages* (1862). 3. *The Languages of the American Indians.*—The native languages of the New World are numbered by many hundreds, all differing totally in their vocabulary, but still agreeing in the peculiar grammatical structure which has given the name of Incorporative (see above). Their area is fast contracting, and they seem destined to disappear.

III. *Inflectional.*—This order consists of two families, so distinct in their grammatical framework that it is impossible to imagine a language of the one family derived from one of the other. It is the peoples speaking these languages that have been the leaders of civilisation within the historic period. The subdivisions of these families will be best understood from the accompanying tables, taken from Max Müller's *Lectures, First Series*.

PHILOMELA, the name of a personage in Greek legend, who was changed according to one account into a swallow, to another into a nightingale. Modern poets are (or rather were, for it was chiefly an 18th c. fashion) fond of calling the nightingale by its classic name.

PHILOPŒMEN, the most illustrious patriot and general who figures in the later history of Greece, belonged to one of the best families of Arcadia, and was born at Megalopolis about 252 B.C. At an early age he lost his father, and was brought up by a wealthy citizen, named Cleander, who took care that he should receive an excellent education. His earliest experiences of war were confined to the border raids of the Arcadians into Laconia; but in 222 B.C., he was one of the defenders of Megalopolis against Cleomenes, king of Sparta. Next year, when the Macedonian king Antigonus marched to the assistance of the Achæans, P. joined him at the head of 1000 horse, and contributed materially to the terrible defeat which the Spartan king received at Sellasia. As tranquillity was now for a short time restored to Greece, P. went abroad to perfect himself in the art of war, and served in Crete with such distinction, that on his return to the Peloponnesus, in 210, he was appointed general of the Achæan horse, and at once proceeded to discipline his men in a vigorous and masterly style. In the expedition against Elis (209) he slew the Elean leader, Demophantus, with his own hand. In 208 he was raised to the highest military dignity then possible in Greece, being elected *strategus* or commander-in-chief of the Achæan League, and in this capacity signalled himself by the great improvements which he effected in the drill, discipline, and armour of the Achæan soldiery. It seemed as if the ancient heroism of the land were reviving. The battle of Mantinea, which took place in the course of the same year, and in which the Spartans were again utterly routed—their general and king, Machanidas, falling by the sword of P. himself—raised him to the pinnacle of fame, and at the Nemean festival which followed he was proclaimed liberator of Greece. His exalted honours did not in the slightest degree disturb the integrity of his character. So great was his influence over his quarrelsome countrymen, that the Macedonian monarch, Philip, began to fear that Greece would regain its independence, and tried to have him secretly assassinated; but the infamous treachery was discovered in time, and its only effect was to endear P. still more to the Achæans. Another of his determined enemies was Nabis, successor of Machanidas in the 'tyranny' of Sparta, but in 201 he inflicted on the latter a severe defeat at Skotetas on the borders of Laconia. During the next few years he was absent in Crete, partly, it would seem, for political reasons, but returned to the Peloponnesus in 194 to find matters in a serious condition. A new and dreaded power—the Romans—had appeared, and overthrown both Philip and Nabis, and P. foreboded future mischief to all Greece from these ambitious warriors. On the departure of the consul Flamininus, Nabis recommenced hostilities against the Achæans; P. was once more appointed *strategus* (192); and in a pitched battle nearly annihilated the troops of Nabis, who himself was shortly afterwards killed by the Ætolians. He now exerted all his power to heal the divisions among the Achæans, and to prevent them from affording the Romans a pretext for taking away their independence. In 188, he took a fierce revenge on Sparta for having put a number of his friends to death, and was in consequence strongly censured by the Roman senate, and by Q. Cæcilius Metellus, who was sent out as a commissioner to Greece in 185. Two years later P. (now an old man of 70)

was elected *strategus* for the eighth time. When lying ill of a fever at Argos, news was brought to him that the Messenians had broken their connection with the league; P. instantly rose from his sick bed, hastened at the head of some cavalry to quell the revolt, but was overpowered by numbers, and fell into the hands of Democrates, the leader of the Messenians, who two nights after sent him a cup of poison, which P. drank off and died. The remains of the hero were brought in solemn procession to his native city—the historian Polybius carrying the urn—and statues were erected to his memory by his grateful and repentant countrymen.

PHILOSOPHY. This word meant originally the 'love of knowledge,' and indicated, therefore, a special taste, appetite, or desire, of which the subject-matter was knowledge. At first, man's pursuit of knowledge was subservient to the immediate uses of life; but, in the course of time, an interest was taken in knowing the order of the world, independent of its application to the common utilities. We find that this stage had been reached in Greece especially, about five or six centuries before Christ; at which time the name 'philosophy' took its rise, being attributed to Pythagoras.

The word has had a variety of acceptations, although all pervaded by the one idea of employing the human understanding in the search for increasing knowledge and certainty. It always implies this effort in a distinguished degree, such as only a few persons in any age have ever been able to sustain. The pursuit of knowledge had to become an end in itself, for the mere improvement of practice would not at first have been a sufficient motive for men to undergo the labours of scientific inquiry. Indeed, this improvement was not at all apparent as a consequence of the earliest efforts of speculation. As one celebrated example, the investigation of the properties of the sections of the cone—the ellipse, parabola, and hyperbola—was without any practical use for nearly two thousand years.

As may be readily supposed, the precise aim of philosophy, the statement of what constitutes its end, has varied with the advancement of its study. In modern times, the pursuit of truth has taken a well-defined form, expressed by the name Science (q. v.). But, in the ancient world, this operation was a mixture of speculation, practice, and sentiment—of legitimate inquiry with aspirations after the unattainable; and hence the word 'philosophy,' in its modern employment, often refers to the subjects that have not as yet adopted the strict scientific form. On this view, science is the goal and the grave of philosophy. (See Lewes's *Biographical History of Philosophy*.) It is chiefly with reference to morals, metaphysics, and the human mind generally, that the term is still retained.

The characters that distinguish the highest form of truth are Generality and Certainty or precision; and in proportion as a subject has advanced in these respects, it might be said to have become philosophical, but we now prefer to use the word scientific. The theoretical foundations of a practical subject, as grammar, are sometimes pretentiously called the philosophy of it. So any department of nature or humanity, where explanations by general laws are furnished, is styled 'philosophical,' thus we have the philosophy of zoology or of history, and a 'philosophical' naturalist or historian.

Again, after definite branches of knowledge have taken a scientific shape, and have been reckoned as distinct 'sciences' (mathematics, &c.) the general principles and views that are supposed to run through the whole, are sometimes called 'philosophy.' This was one of the meanings of the word

in Plato. The great work of Auguste Comte bases its title (*Cours de Philosophie Positive*) upon this consideration.

Professor Ferrier remarks that philosophy is not truth, but 'reasoned truth;' that is, it must be truth presented under the forms and processes that evolve and establish the highest or scientific knowledge. This is merely another mode of stating that philosophy implies a special procedure for attaining truth, the ordinary unregulated operations of the understanding being insufficient.

Among the oldest problems of philosophy, we are to reckon the attempt to generalise the universe, or to resolve all nature into some great unity, or common substance or principle. Thales considered Water the primordial and fundamental principle. Anaximander adopted as the foundation of the universe something called by him the Infinite or Indeterminate, out of which the various definite substances, air, fire, water, &c., were generated, and to which they were again resolved. Anaximenes assumed Air as the primordial substance, which, by rarefaction, produced fire and ether, and by condensation, water, earth, and stone. These three philosophers all belonged to the Ionic colony of Miletus. Pythagoras was an emigrant from Ionia to Italy; he gave Number as the essence and foundation of all existing things: the different numbers being representative of different natural properties and powers; thus, *five* stood for colour, *six* for life, &c. Xenophanes of Kolophon attacked the popular polytheism, and propounded one great indivisible agency comprehending and identified with the universe, which he would not designate as finite or infinite, in motion or at rest. Parmenides of Elea distinguished between self-existent being, Ens, or the absolute, characterised by extension and duration, and phenomenal nature, the region of inferior certainty, or mere opinion. This was the first sketch of what has since been called Ontology, or the science of the *noumenon*, or absolute being. Heraclitus of Ephesus maintained an absolute of a totally different character—a principle of incessant Change, the negation of all substance and stability, a power of perpetual destruction and renovation. Empedocles took his stand upon the Four Elements, out of which all things were constituted by the action of the opposing principles of love, and enmity or discord—a poetical representation of attraction and repulsion. Anaxagoras also treated the world as made up of elements, but indefinite in number. By the attraction of each for its own kind, the primitive chaos was separated, but excepting 'mind,' no element ever was perfectly pure, the character of each substance being determined by the predominance of the proper element. These elements were called the 'homœomeries.' Diogenes of Apollonia, the last of the series called Ionic philosophers, adopted in a modified form the tenet of Anaximenes, that Air was the primordial element. The celebrated Atomic theory originated with Leukippus, but is commonly identified with his pupil Democritus of Abdera. The elements of Anaxagoras were acted on by mind, but with Democritus their activity was inherent in themselves from the beginning.

The grand problem of External Perception (see PERCEPTION) was agitated at an early period, and has been always reckoned a leading question of philosophy. The first attempt at a solution was an application by Democritus of his atomic hypothesis. He supposed that all things were constantly throwing off images of themselves, which enter the soul through the pores of the organs of sense. He was aware that this left us in a state of uncertainty, as to whether the images corresponded to the otherwise unknown originals.

The many difficulties and uncertainties incident to the search for knowledge, could not but be felt by inquirers generally. There was one sect in particular, more especially impressed by this circumstance, and hence called Sceptics, or Doubters. They were represented in antiquity by Pyrrho. They dwelt on the absence of any sure criterion of truth, and pointed out that what was considered most certain was not free from objections, or counter-arguments.

Philosophical speculation began to take definite shape in the age of Plato and Aristotle, the age of the beginnings of many of the sciences. More especially at this time do we find the distinct enunciation of the Philosophy of Human Life, otherwise called Moral and Ethical Philosophy. The questions concerning the end of life, the pursuit of happiness, and men's duties in various relationships, had been answered by a sort of rule-of-thumb experience, rather than by deep reflection or far-seeing combinations. The distinctions of virtue and vice were determined by political society, and connected more or less with religion. There were tests and maxims of conduct, for the most part merely prudential. The first approach to a moralising strain is found in the poems of Hesiod. He combines a gloomy view of life with much practical wisdom, enjoining justice, energy, temperance, and simplicity of living. The 'Seven Wise Men,' who belonged to the 6th c. B.C., followed in the same course, and uttered a variety of sayings or short maxims, of which the most ordinary subjects were 'the uncertainty of human things, the brevity of life, the unhappiness of the poor, the blessing of friendship, the sanctity of an oath, the force of necessity,' &c., together with the simple rules of prudence. The most celebrated saying of this age was the Delphian inscription (of uncertain authorship), 'Know thyself.' The teaching of the Sophists made another stage in the history of moral philosophy. They opened up discussions on virtue, on justice, on the laws, and on happiness; and framed hortatory addresses with a view to moral culture. Socrates then came forward, and instituted a severe logical analysis of the meaning of ethical terms, asking 'What is piety? What is impiety? What is the noble? What the base? What is just? What is temperance? What is madness? What is a state? What constitutes the character of a citizen? What is rule over man? What makes one able to rule?' The rigid search after strict definitions of these terms may be said to constitute a philosophical method in ethics, and hence Socrates is called the first moral philosopher. He gave the impulse to Plato, his successor, who in his turn acted upon Aristotle, and also to the opposing sects of the Cynics and the Cyrenaics—the one affecting a hard and ascetic life, and a proud superiority of the individual will to all outward conventions and customs; the other avowing pleasure as the chief good, sitting loose to the irksome duties of the citizen, and in despair of attaining happiness, sliding into apathy. The Stoics and the Epicureans afforded a similar contrast, although differently expressed. The Stoic ideal was a being in whom the natural impulses and desires should be absolutely subjected to highly abstract views of the universe: the Epicurean ideal was a being moving harmoniously according to natural impulses—in short, following nature up to the limits of prudence.

The last phase of ancient philosophy is represented by Neo-Platonism (q. v.), or the Alexandrian school. In the middle ages, speculative philosophy took the form called Scholasticism (q. v.). At the revival of learning, Descartes and Bacon led in opposite directions, the one representing what is called *a priori* philosophising; the other, *Induction*

(q. v.). From this time, 'philosophy' comes to mean more exclusively the inquiries connected with the mind, as exemplified in the writings of Hobbes, Locke, Leibnitz, Berkeley, Hume, Reid, Kant, &c. The qualified phrase, Natural Philosophy (in the English sense), was applied to a special department of the outer world, as Moral Philosophy was used in connection with mind and the discussion of moral duties. The chief points in the history of modern philosophy will be found under the heads of GERMAN PHILOSOPHY, ECLECTICISM, COMMON SENSE, PERCEPTION, METAPHYSICS, ETHICS; and in the notices of BERKELEY, LOCKE, HUME, REID, KANT, HEGEL, FICHTE, COUSIN, HAMILTON, &c.

PHILOSTRATUS, the Elder, of Lemnos, a famous Greek sophist and rhetorician, was born probably about 170—180, A.D., studied under Proclus at Athens, and finally established himself at Rome, where he became a member of the brilliant and learned circle that gathered round the 'philosophic' Julia Domna, wife of Severus. He was alive, according to Suidas, in the time of the Emperor Philip (244—249). He is the author of a number of works still extant, and not without value on account of their matter, although the style and arrangement are faulty. Among them are a life of Apollonius (q. v.) of Tyana, a description of a collection of paintings at Naples under the title of *Imagines*, biographies of a number of sophists, *Heroica*, Letters, &c. There are complete editions of his works by Morel (Paris, 1608); Olearius (Leip. 1709); and Kayser (Zur. 1844, *et seq.*), of which the last is by far the most correct and critical.—PHILOSTRATUS the Younger, called Philostratus the Lemnian, also a teacher of elocution, was an intimate friend, perhaps a relative of the former, but nothing is known with certainty regarding him.

PHILTRE, PHILTRE (Gr. *philttron*, love-charm, love-potion). A superstitious belief in the efficacy of certain artificial means of inspiring and securing love, seems to have been generally prevalent from very early times; and among the Greeks and Romans (among the latter in the later days of the republic, and under the emperors), love-charms, and especially love-potions, were in continual use. It is not certainly known of what these love-potions were composed—nor can we rely entirely on the details given us on this subject by classic writers, and their commentators in later time—but there is no doubt that certain poisonous or deleterious herbs and drugs were among their chief ingredients, to which other substances, animal as well as vegetable, are said to have been added, coupled with the employment of magic rites. Thessaly had the credit of producing the most potent herbs, and her people were notorious as the most skilful practisers of magic arts, whence the well-known 'Thessala philtre' of Juvenal (vi. 610). These potions were violent and dangerous in operation, and their use resulted often in the weakening of the mental powers, madness, and death, instead of the purpose for which they were intended. Lucretius is said to have been driven mad by a love-potion, and to have died by his own hand in consequence—though the story does not perhaps rest on sufficient authority; and the madness of the Emperor Caligula was attributed by some persons to love-potions given him by his wife Cæsonia—by which also she is said to have preserved his attachment till the end of his life. In the corrupt and licentious days of the Roman empire, the manufacture of love-charms of all kinds seems to have been carried on as a regular trade; the purchasers, if not the makers of them, being chiefly women. The use of philters seems to have been not unknown during the middle ages; and in the

East, the nurse of superstition of all kinds, belief in the power of love-potions lingers probably down to the present day.

PHLEBE'NTERISM is a term invented by De Quatrefages to designate an anatomical arrangement, existing, as he supposed, in certain of the nudibranchiate molluscs, and characterised by ramified prolongations of the digestive tube, in virtue of which the digestive apparatus, to a certain extent, supplies the place of a complete circulatory apparatus, and aids in the process of respiration. The researches of Alder and Hancock, and other zoologists, seem, however, to shew that in these animals the circulation is as complete as in the gasteropod molluscs generally, and that these ramified prolongations are of the nature of a rudimentary liver. For further information on this subject, the reader is referred to De Quatrefages's *Rambles of a Naturalist*, vol. i. pp. 348—353.

PHLEBITIS, or INFLAMMATION OF THE VEINS (Gr. *phlebs*, a vein), although seldom an original or *idiopathic* disease, is a frequent sequence of wounds, in which case it is termed *traumatic phlebitis* (from the Greek *trauma*, a wound), and is not uncommon after delivery. The disease is indicated by great tenderness and pain along the course of the affected vessel, which feels like a hard knotted cord, and rolls under the fingers. The hardness is, however, sometimes obscured by the swelling of the limb beyond and about the seat of the disorder, partly in consequence of the effusion of serum caused by the obstruction to the return of the venous blood (which thus gives rise to a local dropsy), and partly in consequence of the propagation of the inflammation to the surrounding tissues. The inner surface of the inflamed vessel is supposed to throw out fibrinous fluid, which coagulates in layers, and finally closes the tube. If the vessel is small, the consequences of its obstruction may be of little importance, but when a large vein is affected, the consequences are always dangerous, and may be fatal.

There are two modes of recovery: solution of the coagulated fibrine may take place, and the vessel may again become pervious; or, as is more commonly the case, the obstruction may continue, but a collateral venous circulation may be established, and the circulation thus carried on through a circuitous route. With the return of the circulation—in whichever of these two ways it is accomplished—the swelling subsides, and the patient gradually recovers. If, however, the disease advances, supuration takes place within the coagulum, and one of two things happens; either abscesses are formed along the vein, or the pus gets into the current of blood and contaminates the circulation, giving rise to the perilous disease known as *Pyæmia* (q. v.). Either condition is dangerous; the latter pre-eminently so.

Phlebitis generally originates in some local injury of a vein, and the inflammation, when once established, is readily propagated along the course of the vessel. Sometimes very slight injuries give rise to it. It occasionally occurs after venesection, especially with a dull lancet, or one soiled by contact with diseased matter. Women are peculiarly liable to this disease after delivery, as the veins of the womb are apt to become inflamed, and to communicate the inflammation to the venous trunks connected with them. See PHLEGMASIA.

There is considerable difference of opinion as to the treatment to be pursued; some high authorities (Dr Wood, for example) recommending 'the very free use of leeches along the affected vein,' and that they 'should be repeated over and over again if the

symptoms of inflammation should persevere,' the subsequent application of cold lotions, and the internal use of mercury 'pushed to a moderate salivation;' while others question the utility of such treatment, and recommend 'rest, warm fomentations and poultices, early incision of abscesses, evacuation of bile and fæces by one or two doses of calomel, opium to relieve pain and insure quiet of mind and body, and wine, especially if there has been great loss of blood.'—Druitt's *Surgeon's Vade Mecum*, 8th ed., p. 326. The latter is in most cases the preferable mode of treatment. During convalescence, the patient must be satisfied if the swelling goes down slowly. Time is required for the enlargement of the veins by which the collateral circulation is to be carried on; and active counter-irritation, such as the application of ointments of iodine or mercury, if employed incautiously, frequently does harm by increasing the inflammation. With care, however, they are useful appliances; and if, after giving them a fair trial, much swelling should remain, the practitioner must have recourse to carefully regulated bandaging and the use of diuretics.

PHLEBOLITES (Gr. *phleps*, a vein, and *lithos*, a stone) are calcareous concretions formed by the degeneration of coagulations in veins, or occasionally originating in the coats of the vessel. They are seldom detected till after death, although cases are on record in which, occurring in subcutaneous veins, they have given rise to external tumours of considerable size.

PHLEBOTOMY. See BLEEDING.

PHLEG'ETHON, i. e., the Flaming, a river of the infernal regions, whose waves rolled torrents of fire. Nothing would grow on its scorched and desolate shores. After a course contrary to the Cocytus (q. v.), it discharged itself, like the latter stream, into the Lake of Acheron.

PHLEGMA'SIA ALBA DO'LENS, or **MILK-LEG**, is a disease which is most common in women after parturition, especially if they have lost much blood, but sometimes occurs in unmarried women, and occasionally in males. It usually commences about a week or ten days after delivery with a feeling of pain in the loins or lower part of the abdomen, whence it extends to the groin and down the thigh and leg. The pain soon becomes very severe, and principally follows the course of the internal cutaneous and crural nerve of the thigh and of the posterior tibial in the leg. The limb soon begins to swell, and in the course of a couple of days, is sometimes twice its ordinary size, and as the swelling develops itself, the acuteness of the pain considerably diminishes. The limb is partly flexed, and lies motionless; any movement aggravates the pain. The swelling extends uniformly over the limb, which is pale and shining, and hot and firm to the touch, seldom pitting on pressure. The femoral vein may usually be felt like a hard cord, and this symptom, taken with the swelling, clearly indicates that this affection is essentially *crural phlebitis*. The uniformity of the cord is interrupted by nodules, arising either from inflamed cellular tissue, or from clots within the vein. Both legs are seldom attacked at the same time, and the left thigh is the most common seat of the disease.

This affection usually terminates favourably, the acute symptoms disappearing in about ten days or a fortnight. The swelling, however, often continues for a long time, and sometimes lasts for life. Very different opinions have been held regarding the nature of this disease. At one time, it was considered as the result of metastatic secretion of milk (or, in other words as due to the milk leaving

the breast, and settling in the thigh, and hence the term *milk-leg*. There is now no doubt that the disease is inflammation originating in the veins of the womb, and extending to those of the lower extremity. The treatment is the same as for *Phlebitis* (q. v.) generally. Warm poppy fomentations, or bran poultices sprinkled with laudanum, may be applied externally at the beginning of the attack, after which flannel saturated with a liniment, composed of one part of laudanum to two parts of soap liniment, may be applied round the limb in the form of a bandage, applied not so tightly as to occasion pain. If necessary, the bowels must be gently opened with castor oil, and opium given to allay pain and induce sleep.

PHLE'UM. See TIMOTHY GRASS.

PHLOGI'STON (Gr. *combustible*) was the term employed by Stahl, professor at Halle, in his *Zymotechnia Fundamentalis*, 1697, to designate a hypothetical element which, by combining with a body, rendered it combustible, and which occasioned combustion by its disengagement, there being left, after its evolution, either an acid or an earth. In the above-named work, he maintains that the processes of obtaining sulphur from sulphuric acid, and of procuring the metals from their earths or *calces*, are analogous, and consist alike in the addition of his phlogiston. Thus, sulphur, according to the phlogistic theory—which held undivided sway in chemistry until the time of Lavoisier, who substituted for it the theory of oxygenation (1775—1781), and was maintained by a few chemists, especially Priestley, till the beginning of the present century—was composed of sulphuric acid and phlogiston; lead, of the *calx* of lead and phlogiston; &c. In consequence of the general adoption of the phlogistic theory, when Priestley, in 1774, discovered oxygen, and when Scheele, a little later, discovered chlorine, the names these chemists gave to their discoveries were *dephlogisticated air* and *dephlogisticated marine acid*. According to modern views, mainly based on Lavoisier's experiments, the addition of oxygen takes place in the formation of acids and of earths, instead of the subtraction of phlogiston. The question whether the process was, in fact, one of addition or subtraction, was finally decided by the balance, an instrument to which chemistry owes most of its marvellous progress during the last three-quarters of a century.

PHLOX, a genus of plants of the natural order *Polemoniaceæ*, distinguished by a prismatic calyx, salver-shaped corolla, and unequal filaments. The species are pretty numerous, mostly perennial plants with simple leaves, and mostly natives of North America. A number of species are common in our flower-gardens. This has of late become a favourite genus with florists, and many very fine varieties have been produced.

PHO'BEROS, a genus of trees of the natural order *Flacourtiaceæ* or *Bizaceæ*, of which one species, *P. Mundtii*, the *Klipdoorn* of the Dutch colonists of South Africa, although only 20—30 feet high, attains a diameter of three feet or more, and is very useful for the purposes of wagon-makers and house-carpenters, the wood being hard and fine-grained; another South African species, *P. Ecklonii*, the *Roodpeer* of the colonists, has a hard, heavy, and fine-grained wood, used by cabinet-makers, millwrights, &c.

PHOCÆ'NA. See PORPOISE.

PHO'CAS, emperor of Constantinople (602—610), was a Cappadocian by birth, and was for some time groom to Priscus, one of the celebrated generals of the Emperor Mauricius (q. v.). His brutal courage

gained him a great reputation among the soldiers, and though only a centurion at the time of the revolt against Mauricius, he was elevated to the throne by the soldiers. To secure himself, he caused Mauricius to be murdered, along with his five sons and his principal adherents; and then, by a treaty disgraceful to the empire, got rid of the Avars. But his troubles were just commencing, for Khusrû II. (q. v.), Shah of Persia, hearing of the death of his friend and benefactor, Mauricius, an event which freed him from the obligation of amity with the Eastern Empire, took up arms to revenge his friend's murder, and to recover for Persia all the territories previously under her sway. The war was fiercely carried on for 24 years, during the first 18 of which the Persian army were uniformly successful, and the Byzantines were almost completely driven out of Asia. See KHUSRÛ II. and HERACLIUS. P. remained in the capital, to overawe his turbulent subjects, conscious of his unfitness to command the army; and abandoned himself to his animal appetites, tyrannising over the people without the least regard to justice, and putting to death whomsoever he thought dangerous, among others, Narses, the celebrated general in the former Persian war. Constantina, the widow of Mauricius, excited against the tyrant two formidable insurrections, the latter in 607, but both were speedily quelled; and the empress, with her daughters, was beheaded on the same spot where her husband and sons had been slain. Her principal adherents, some of whom were among the highest officers of state, suffered death under the most horrible tortures. These cruelties, and the successes of the Persians, had well-nigh ruined P.'s power and influence. But he gave the *coup de grâce* to it himself by insulting his favourite and son-in-law, Crispus, who had remonstrated with him on his conduct. Crispus revenged himself by forming a conspiracy against him, along with Heraclius, exarch of Africa—the result of which was the overthrow of the tyrant, who was taken prisoner (October 3, 610). After being insulted and tortured, he was beheaded, and his body dragged through the streets by the mob.

PHO'CIDÆ. See SEAL.

PHO'CION (Gr. *Phokión*), an Athenian general, of noble and unselfish character, was born about the end of the 5th c. B.C. Clinton, in his *Fasti Hellenici*, gives the date 402 B.C. He was of humble origin, but appears to have enjoyed a superior education, and to have studied under Plato, Xenocrates, and perhaps Diogenes also, from the last of whom he may have acquired his habit of indulging in caustic sarcasm. P. first attracted notice in the great sea-fight at Naxos (376), where he commanded a division of the Athenian fleet, and materially helped to secure the victory for his countrymen. Strange to say, however, we scarcely hear of him again for more than 20 years; but in 351, along with Évagoras, he undertook the conquest of Cyprus for the Persian monarch, Artaxerxes III. (Ochus), and was completely successful. About the same time, but the exact date is uncertain, he led an Athenian expedition into the island of Eubœa, where Philip of Macedon was intriguing, and inflicted a severe defeat on that powerful sovereign at Tamynæ. In 341, he was again successful in crushing the Macedonian party in Eubœa, and in restoring the ascendancy of Athens. Two years before this, he had achieved a similar result at Megara; and in 340, when sent to the aid of the Byzantines against Philip, he acted with so much prudence and tact, and inspired the citizens with so much zeal and courage, that Philip was forced to abandon the siege, and even to evacuate the Chersonesus; while P. captured several

of his ships and coast-garrisons, besides making havoc of a good deal of the Macedonian territory. Nevertheless, with just appreciation of the real weakness of Greece Proper, and of the strength of Macedon, he advocated, even in the midst of his triumphs, pacific views, and the establishment of better relations with the enemy. His advice was not taken; but the fatal battle of Chæronea, only two years afterwards, in which the independence of the Greek republics was lost for ever, proved its soundness. The murder of Philip, in 336, occasioned the greatest exultation, and Demosthenes even proposed a public sacrifice of thanksgiving, and the establishment of religious honours to the memory of the assassin, but P. resisted, and prevented so monstrous a proposal. Henceforth, his career is chiefly political. We see him struggling at Athens to repress what appeared to him the reckless desire for war on the part of the fanatical patriots, on account of which he was regarded as a traitor, but his personal honour is above suspicion. After the death of Alexander in 323, the aged P. endeavoured, but in vain, to hinder the Athenians from going to war with Antipater. The battle of Cranon, next year, which prostrated his countrymen, again evinced the wisdom of his counsels; but, though very unhand-somely treated by the Athenians, he used all his influence with the conqueror (who, like Alexander, had a profound respect for him) to mitigate their hardships. After the death of Antipater, P. was involved in the intrigues of Cassander, the rival of Polysperchon, and was forced to flee to Phocia, where Polysperchon delivered him up to the Athenians. He was condemned, by 'a mixed mob of disfranchised citizens, foreigners, and slaves,' to drink hemlock. His body, flung unburied over the borders of the state, was carried by some of his friends to Eleusis, and burned there. The Athenians soon began to raise monuments to his memory. His life has been written by Plutarch and Cornelius Nepos.

PHO'CIS (Gr. *Phókis*), a province of Greece Proper or Hellas, bounded on the W. by the Ozolian Lokri, on the N. by Doris, on the E. by the Opuntian Lokri, and on the S. by the Gulf of Corinth. It was about 792 square miles in extent. The greater part of the country is occupied by the famous mountain-range of Parnassus (q. v.). The principal river is the Cephissus. According to tradition, the most ancient inhabitants were the Leleges, Pelasgians, and Thracians, from the gradual mixture of whom the Phocians were believed to have arisen. These were finally united into a free federal state, which derives its chief historical importance from possessing the famous oracle of Delphi (q. v.). During the Peloponnesian war, the Phocians were close allies of the Athenians. In the time of Philip of Macedon, they were involved in a ten years' war, on account of their opposition to a decree of the Amphictyonic Council, concerning the use of a piece of land belonging to the temple of Delphi. This war, commonly known as the Sacred or Phocian War, ended disastrously for the Phocians, the whole of whose cities (22 in number) were destroyed, with one exception, and the inhabitants parcelled out among the hamlets.

PHŒ'BUS (i.e., the Bright or Radiant), a title, and subsequently a name, of Apollo. It had reference both to the youthful beauty of the god, and to the radiance of the sun, when, latterly, Apollo became identified with Helios, the sun-god.

PHŒN'ICIA (Gr. *Phoinike*, derived either from *Phoinos*, purple, or *Phoinix*, palm-tree—both designations descriptive of the chief produce of the country; the Hebrew term *Kenan*, Lowland,

referring to its physical condition) is the name given by the Greeks and Romans to a certain territory situated about 34°–36° N. lat., bounded by the Mediterranean on the W., by Syria to the N. and E., and Judæa to the S. Except where the Mediterranean set a natural boundary, the frontiers differed widely at different periods, north, south, and east, according to the gradual rise and decline of the country. Its length may be said to have been about 200 miles, while its breadth never exceeded 20 miles, making a total of about 2000 square miles. We may here mention some of the products of the soil, the exportation of which, to a certain extent, laid the foundation of her greatness. Pine, fir, cypress, cedars, terebinths, palm and fig-trees, sycamores, olive-trees, and acacias, crown the heights; while wheat, rye, and barley are found in the lower regions, together not only with ordinary fruit, but also with apricots, peaches, pomegranates, almonds, citrons, sugar-cane, grapes, bananas—all growing luxuriantly, and forming a forest of finely-tinted foliage. The land further yields silk and cotton, indigo and tobacco; and the modern inhabitants of Shur, like their forefathers of old, drive a profitable traffic with the produce of Mount Lebanon, its timber, wood, and charcoal. Flocks of sheep and goats, and innumerable swarms of bees, supply meat, milk, and honey. The sea furnished shoals of fish, and molluscs for the purple of Tyre. There are no precious metals found anywhere in P.; but it is rich in iron, and the stone-quarries of Lebanon were already worked in Solomon's time.

The question of the origin of the Phœnicians is one which has hitherto not been solved satisfactorily. Their own account, as preserved by Herodotus, speaks of their having immigrated from the 'Sea called Erythra'; a report further confirmed by another passage in his History, and by Justin. Strabo speaks of two islands in the Persian Gulf, called Tyros or Tylos and Aradus, in which temples were found similar to those of the Phœnicians; and the inhabitants of these cities stated that the Phœnicians had left them in order to found new colonies. The Erythrean Sea, in its widest sense, extends from the eastern shores of Egypt to the western shores of India; and since Genesis calls Canaan, the founder of the race, a descendant of Ham, not of Shem, some investigators have come to the conclusion, that the Persian or Arabian Gulf is the original home of the Phœnicians. Against this notion, however, weighty arguments have been brought forward, both from the genuine traditions of the people itself, as preserved, not in a corrupted Greek shape, but in their myths, in the biblical accounts, in their language, which even in its very oldest remnants (Canaan = Lowland; Sidon = Fishing-place; Gîblites = Mountain-people) is purely Semitic. It would be vague to speculate on the time at which the first Phœnician settlers entered the country: as vague as to conjecture—the Erythrean Sea being put out of the question—whence they came. So much seems certain, that they did not enter it from one region, but from several sides, and at various periods; and that only very gradually, in the course of long pre-historic centuries, they grew into one nationality, embracing the tribes that inhabited the sea-coast, or Phœnicia Proper, from Sidon to Gaza, and the cities north of Sidonia. The latter term included the many separate states originally formed by the various *gentes*, who again, originally, had their own political existence, laws, and even worship. Gradually, however, the larger communities extended their rules over the smaller ones, or rather combined with them for the formation of a more imposing and important state into which the different states were merged,

without, however, giving up their own individual existence or cultus entirely. The most important of these special tribes or states were the inhabitants of Sidonia—a term, however, expressive both of the inhabitants of the city and of the whole country—the Tyrians, whose settlement, according to their own traditions, was prior to any other Phœnician settlement (about 2750 B.C.); and Aradus, founded, according to the native traditions, by Arvadi, 'the brother of Sidon.' From these three tribes—of the Sidonians collectively—are to be distinguished the Gîblites with their two sovereignties of Byblus and Berytus, who differed in many respects from the former, and who, it may be presumed, formed at first the ruling state of P., until they were brought under Sidonian dependency. Several smaller tribes or states are mentioned in Scripture—Arke, Sin, Hamath, &c.—but little is known about them.

Of the government and internal constitution of these states or cities, we know next to nothing. There were hereditary monarchs ruling over Sidon, Tyrus, Byblus, Berytus, and Aradus, for whose confirmation, however, the assent of the people was necessary in all cases. By the side of the king stood a powerful assembly, composed of representatives of the old aristocratic families of the land, whose numbers differed at various periods. When Tripolis was founded by Tyrus, Sidon, and Aradus, as a place of joint meeting for their hegemony, every one of these cities sent 100 senators to watch her special interests at the common meeting; and the senate of Sidon seems, in the 4th c. B. C., at least, to have consisted of 500–600 elders, some of whom were probably selected more for their wealth than for their noble lineage. The king sometimes combined in his person the office of high-priest. The turbulent seething mass of the people, consisting of the poorer families of Phœnician descent, the immigrants of neighbouring tribes, the strangers, and the whole incongruous mass of workmen, tradespeople, sailors, that must have abounded in a commercial and maritime nation like the Phœnicians, and out of whose midst must have arisen at times influential men enough—was governed, as far as we can learn, as 'constitutionally' as possible. The unruly spirits were got rid of in Roman fashion somehow in the colonies, or were made silent by important places being intrusted to their care, under strict supervision from home. Only once or twice do we hear of violent popular outbreaks, in consequence of one of which it was mockingly said that P. had lost all her aristocracy, and what existed of Phœnicians was of the lowest birth, the offspring of slaves. As the wealth of all the world accumulated more and more in the Phœnician ports, luxury, and too great a desire to rest and enjoy their wealth in peace, induced the dauntless old pirates to intrust the guard of their cities to the mariners and mercenary soldiers, to Libyans and Lydians—'they of Persia and of Lud and of Phut,' as Ezekiel has it; although the wild resistance which this small territory offered in her single towns to the enormous armies of Assyria, Babylonia, and Greece, shews that the old spirit had not died out.

The sources for the early Phœnician history are of the scantiest description. Of the annals and state documents which filled the archives of every large city, nothing has survived except a very doubtful record, which Sanchuniatho (q. v.) is said to have compiled, about 1250 B.C., in Phœnician from official documents, and which was translated into Greek by Philo of Byblus, and a fragment of which is preserved by Eusebius. The Bible, principally Ezekiel, Menander of Ephesus, and Dius, a Phœnician, who wrote the history of Tyre from Tyrian annals, fragments of which are extant in Josephus

and Syncellus, Herodotus, Diodorus, Justinus, and others, together with a very few notes scattered throughout the Church Fathers, contain the sum of all our information. Four great periods, however, are clearly distinguishable in the history of ancient Phœnicia. The first would comprise the earliest beginnings and the gradual development of the single states and tribes, from their immigration to the historical time when Sidon began to take the lead, or about 1500 B.C. The second period dates from the conquest of Palestine by the Hebrews. Sidon had then become already the 'first-born of Kanaan,' as Genesis has it, or 'Sidon Rabbah,' the Great Sidon. The flourishing state of its commerce and manufactures appears likewise from several passages in Homer. The silver vase proposed by Achilles as a prize in the funeral games in honour of Patroclus, was a work of the 'skilful Sidonians;' the garment Hecuba offers as a propitiatory gift to Minerva was the work of Sidonian women. The gold-edged silver bowl given to Telemachus by Menelaos, Hephaistos had received from the king of the Sidonians. Ulysses is left on the island of Ithaca by the Phœnicians, who sail away to 'well-peopled Sidonia.' The gradual ascendancy of the rival city of Tyre marks the beginning of the third period, in which P. reaches the height of its power, in which her ships covered all the seas, her commerce embraced the whole earth, and her innumerable colonies flourished far and near. The first historically-recorded item of Tyre's activity is her foundation of Gades, a few years before that of Utica, in 1100 B.C. The reason of the sudden greatness of Tyre is to be found in the defeat of the Sidonians by the king of 'Askalon'—a term probably meant to represent the whole pentapolis of Philistia—about the year 1209; in consequence of which, the principal families of Sidon 'emigrated in their ships to Tyre, which [viz., the Island-city] they founded.' In the 11th c., in the time of Samuel, 'the princes of the Tyrians' are already spoken of instead of the Sidonians, as the representatives of Phœnicia. During the reigns of David and Solomon—under Hiram (980—917)—the friendliest relations existed between the two nations: both in the full bloom of their power. Each country needed what the other could supply. Hence their close alliance, which led even to common commercial enterprises in ships built by Solomon, the supercargoes of which belonged to him, while the mariners and pilots were Hiram's.

By this time, Phœnician colonisation had reached its utmost extent. In the space of three centuries (1300—1000), the Phœnicians had covered all the islands and coasts of the Mediterranean with their forts, their factories, and their cities; and their ships, which ploughed the main in all directions, everywhere found their own ports. They had colonised Cyprus, thus commanding the waters of the Levant and the coasts of Syria and Cilicia. Kithion, Amathus (Hamath), Karpasia, Paphos, with its magnificent temple of Ashera, Keryneia, and Lapothos, were some of their principal settlements in those regions. Northward, on the coast of Cilicia, they founded the cities of Myriandros, Tarsos, and Soloi. Migrating to the west, they took possession of Rhodes, Crete (cf. the Myth of Zeus and Europe), Melos, Thera, Olios (near Paros), and Cythera, on the coast of the Peloponnese. To the east of the Ægean, we find them at Erythra, and further, as masters of the islands of Samothrace, Lemnos, and Thasos with its wealth of gold mines. The Ægean Sea, with all its islands, being in their hands, they sailed thence further west, to Sicily, where they settled at Motye, on the extreme west point; founded Rus

Melkarth, in the south (Heraclea Minoa); in the north, Machanath (Panormos, Palermo), and further, Melite (Malta) and Gaulos. They owned Caralis (Cagliari) in Sardinia, Minorca, Iviza (Ebusos), Elba; on the opposite, or African coast, Hippo, Utica, Hadrumetum, Leptis, and some minor island states. From Sardinia and Minorca, the indefatigable mariners went still further west—through the Strait of Gibraltar to Tarshish (the California of those days) or Spain, where they founded Gadeir or Cadiz, and in the south, Karteja, Malaka, and Abdarach. From here, having colonised well-nigh the whole of the Spanish coast, they went northwards to the tin islands (Scilly Isles), and to Britain herself. And while they thus explored the regions of the Atlantic, their alliance with the Hebrews had permitted them to find the way to the Indies by the Red Sea.

The impulse given to industry and the arts by this almost unparalleled extension of their commercial sphere, was enormous. Originally, exporters or traders only for the wares of Egypt and Assyria, they soon began to manufacture these wares themselves, and drew the whole world into their circle of commerce. As to the early and most extensive commercial intercourse between P. and Greece and her colonies, nothing can be more striking than the circumstance of nearly all the Greek names for the principal objects of oriental commerce being Phœnician, or rather Semitic—identical almost with the terms found in the Old Testament. Thus, of spices—myrrh, cassia, cinnamon, galbanum, narde, aloe, crocus, nitron, balsam, &c.; of jewels and precious stones, sapphire, jasper, smaragdus; of fine materials, and garments, byssus, karpasos, sindon, &c.; musical instruments—nabla, tympanon, sambyke, &c.; oriental plants, vessels, and even writing implements. The wealth of silver, iron, tin, and lead was chiefly got from Tartessus. The descriptions of the abundance of precious metals there verge on the fabulous. Thus, the Phœnicians are supposed to have made even their anchors of silver, when they first discovered the country, not knowing how to stow away all the silver in their vessel. What must have been the state of these mines is clear from the fact, that, even in the Roman time, 40,000 men were constantly employed as miners, and the state received a clear revenue of 20,500 drachms daily. The 'Fortunate Islands,' which, according to Diodorus, they discovered after many days' sailing along the coast of Africa, beyond the Strait of Hercules, and which, to judge from the name *Purpurarie* given to some islands off the coast of Mauritania, would seem to have been the Canaries, yielded them the shell-fish *purpura*, so useful for their dyeing manufactories. Besides their wholesale commerce carried on by fleets and caravans, they also appear to have gone about the interior of Syria and Palestine, retailing their home or foreign produce.

Although the Phœnicians were erroneously believed, by the western tribes, to manufacture all the wares in which they dealt themselves, yet no inconsiderable number of them was really their own work. None of their manufactures, however, stood in so high repute throughout antiquity as the purple dye prepared from the *muricidæ*, a shell-fish of its coast; and none excelled more in it than the Tyrians. Purple was an almost indispensable luxury of antiquity, particularly in Asia. In temples and palaces for gods and men, purple garments, hangings, curtains, and veils were needed; and Alexander the Great found in Susa alone a store of purple worth 5000 talents. Sidon's principal production was glass—invented there, it was said, by

accident; but probably the invention was derived from Egypt, where it was in use long before; the Phœnician glass, however, was always supposed to be the best. The Sidonians knew the use of most of our own contrivances—the blowpipe, the lathe, and the graver. Hardly less great was the fame of Phœnician metallurgy. Their mining operations in the Lebanon and Cyprus, where they dug for copper; in Thasos, where, according to Herodotus, they overturned a whole mountain in searching for gold; but more particularly in Iberia, where at first silver was so abundant, that hardly any labour was required to obtain it—were stupendous; and the minute description of the mining-process contained in Job (chap. xxviii. 1—11) has probably been derived from a sight of Phœnician mining-works. That they well understood how to work the metals thus gained, has been observed already. The art of founding brass must, indeed, have reached a high perfection to enable Hiram Abif to execute such works for Solomon's Temple as they are described in the Bible. No less were they familiar with the art of imitating precious stones, and colouring glass by means of metallic oxides. To Sidon is further attributed the pre-eminence in the glyptic and plastic arts; and the artists sent by Hiram to Solomon were skilful workers in gold and silver, in brass, in iron, in purple and in blue, in stone and in timber, in fine linen, and the engraving of precious stones. Their architecture seems to have been of a Cyclopean nature. Their vessels, originally simple rafts, gradually developed—with the aid of the Lebanon, which afforded inexhaustible supplies of timber, and Cyprus, which possessed all the materials necessary for fitting up a ship, from the keel to the sails—into a first-rate fleet, consisting of round ships, or gauli, for short or coasting voyages; war-galleys, or triremes; and fifty-oared craft, long in build, and adapted for rapid sailing or rowing. The internal arrangement of these vessels was perfect, and excited the wonder and admiration of the Greeks, by their being so splendidly adapted at once for navigation, freight, and defence. Their extraordinary three years' voyage of discovery, undertaken in the service of Necho, round Africa, going out of the Red Sea, and returning by the way of the Strait's mouth, is as well known as their voyages in the service of Solomon.

The golden age of P., during which her colonies, her manufactures, and her commerce were in this most brilliant phase, seems to have waned simultaneously almost with that of Judæa. As Solomon in the latter, so does Hiram in the former, mark the end of that peace and happiness which had made their countries rich and glorious, as no other country of their day. According to a fragment preserved in Menander, Hiram was followed by his son Balestartus, who died after a short reign of seven years, in 940 B.C., and a long series of political calamities and civil wars ensued. The last of Hiram's sons, Pheletus, fell, in 898, by the hands of Ithobaal, the priest of Astarte, into whose family now passed the kingdom of Tyre. He is the Ethbaal mentioned in Scripture as the father of Jezebel, and father-in-law of Ahab; and a peculiar coincidence is the simultaneous mention of the three years' drought in Judæa (to which an end was put by Elijah's prayer) and in P., where relief was obtained by Ithobaal, who seems to have stood in the odour of sanctity. It was during this unhappy period that the celebrated Elissa, better known as Queen Dido (q. v.), fled, together with some of the most aristocratic families of Sidon, to Libya, where they founded a new city (Kartachadata = Carthage), near the spot of an ancient Sidonian settlement, about 813 B.C. The

fourth and last period of Phœnician history may be dated from the middle of the 8th c., when Shalmaneser, the king of Assyria, invaded P., and besieged Tyre for five years, but without result; and there is every reason to believe that the peace concluded at the end of this period was very favourable to Tyre. But soon afterwards, P. was drawn into the struggle for the supremacy then raging between Chaldæa and Egypt, and was conquered by the former power. A further calamity befel P. at the hand of Pharaoh-Apries, who anticipated Nebuchadnezzar's intended attack on Egypt by destroying the Phœnician fleet, conquering the country, and pillaging it. These calamities produced a series of internal troubles, in consequence of which the constitution was constantly changed; and we hear now of a series of kings, and now of provisional *suffetes*—all their respective reigns, however, being of very brief duration. From that time forward, and even before the special histories of Sidon and Tyre, which alternately possessed themselves of the hegemony of Phœnicia, constitute also the history of the country itself, and to these two cities we refer for what momentous events took place in the latter days of the once mighty empire. The battle on the Issus terminated even the shadow of P.'s independent existence, and it shared the fate of Alexander's vast empire. In 65 B.C. it became, under Roman dominion, part of Syria, and has since shared her fate for good or evil. See SYRIA, SIDON, TYRE, CARTHAGE.

Religion.—With regard to the Religion of the Phœnicians, its real character has as yet been imperfectly explicated. Deprived of all original and direct information on the subject, we have to cull what scanty notices we may from the works of Greek and Latin writers, or to gather knowledge from some vague allusions contained in the Bible. Not a scrap of native literature has been allowed to survive; and the supposed extracts from a Greek version by Philo of Sanchuniatho's Phœnician works, which we find in Eusebius—hitherto our chief source of information—must be used with more than an ordinary degree of caution. See SANCHUNIATHO. We shall therefore, without entering into futile speculations, confine ourselves to a few general and well ascertained facts; premising, however, that Phœnician theology is far from being a hopeless province, whatever it may appear now. Excavations are on foot in all directions, both in the mother-country and in the colonies, and new discoveries are being brought to light constantly.

The religion of the Phœnicians was, like all ancient Semitic religions—except that of the Hebrews—a kind of pantheistic worship of nature. While Monotheism, with the descendants of Abraham, assumed a supreme power within nature, which, according to its own free will, creates and destroys, the rest of the East assumed a Dualism: two elements, a male and a female; or two highest deities, one of whom begets, and has the power to destroy, and the other conceives and bears. These two supreme beings were sometimes merged in one deity, with male and female attributes, which spread out into immense ramifications: representatives now of the general powers of nature, now of the particular phenomena in nature, or the life of men. They had deities who ruled over the stars, the elements, the seasons; over special localities, or over certain phases of life. No nation of antiquity perhaps possessed a more endless pantheon than the Phœnicians: a circumstance easily explained by their peculiar position and relations. Consisting originally of a variety of tribes, each of whom had had their own special deities—although the supreme

Numen, or the principle of their chief Deity, was probably the same with all—those Phœnicians who dwelt in the north differed in some respects, such as the names and attributes of certain gods, from those of the south. Besides this, it must not be forgotten that the period of Phœnician history ranges over 2000 years, and their political career, as well as their commerce, brought them in close and constant contact with nearly all the civilised nations of the then known world; and being both superstitious (as sailors and traders are prone to be), and possessed of an adaptability to which partly they owed their success in other respects, they easily, if not greedily, received into their wide pantheon those who, albeit the special national gods of others, or because of this very reason, could either harm or benefit them. It may be also that a certain easy nonchalance about these things, such as the wealthy and aristocratic classes displayed in ancient Rome and elsewhere, and the interest of the priests, who received very considerable tithes of every sacrifice (oddly enough, our information on that point leaves nothing to be desired), went hand in hand to favour the gradual introduction of as many gods and goddesses as pleased the herd. Their proper divisions, however, their real names and derivations, and the history and time of their nationalisation, are things which will for ever continue to puzzle investigators.

Setting aside such more or less vague and undefined names of deities as were common to the whole Semitic stock, and as they are found in the Hebrew records—like *El* (Mighty One), or (in plural) *Elohim*; *Olonim* [*Elyon*] (the Most High); *Adon* (Lord); *Melech* [*Moloch*] (King); &c.—we find in the first rank of gods (of Tyre and Sidon) Baal (q. v.) and Astarte (q. v.). Baal again occurs in two different characters, as it were—as *Baalsamin* (Lord of Heavens), the highest god ruling over the Universe, the Zeus Olympios, and Jupiter Optimus Maximus; and as *Baal Melkarth*, the special national numen. Baalsamin is originally identical with the Babylonian Bel or Baal. The third supreme Tyrian goddess was Astarte, worshipped as the very counterpart of the Sidonian *Astarte*. While the latter was considered a pure virgin, whose emblem was the moon, the former (the biblical Asherah) was propitiated (as Venus, goddess and planet) by prostitution. The Tyrian Astarte was principally known under the name of Tanis (q. v.), the Assyro-Persian Tanais, and was married to Baalsamin, and also to Adonis, and bore altogether the character of a goddess who delighted in chastity.

The principal deities of Northern P.—the non-Sidonian tribes—consisted of a different trias—*El*, *Baalit*, and *Adonis*. The first was the supposed founder of the two oldest Phœnician cities of Byblus and Berytus, and corresponded to (being originally, perhaps, identical with) both Baalsamin, as the highest deity, and Melkarth, as the special god of Tyre. Baaltis, Beltis (My Lady—Aphrodite), worshipped at Byblus, Berytus, Aphaka, Arke (Architis), &c., was joined to Adonis (q. v.), whose cultus had been imported from Assyria, and is therefore unknown in the more ancient Phœnician colonies, in Africa and Spain. Byblus called him Adonis Ganas, or Ganan (perhaps Gaavan, the Exalted); near Byblus, we find him worshipped as Elyon (the Highest); as Esmun in Berytus, and perhaps also under the name of Memnon, at Apamea, where an annual mourning-festival was celebrated in his honour; further, near the river Bandas at Paltos; and at the river Belus. As Serach (the Brilliant) in Phœnician, and Kharush (the Sun) in Persian, he appears to have had some relation to the star-and-planet worship which became, under Assyrian

influence, a prominent feature of the Phœnician religion.

Besides these more or less localised gods and goddesses (*Dii Majores*), a certain number of deities—states and country deities—were worshipped in common by all Phœnician states. They were called the Children of Sadik (the Just), or the Children, or the Pataki (Descendants of Phtha), or the eight Kabiri (Strong Ones). They are the maritime gods, and their images were placed on the prows of Phœnician ships. As protectors of navigation, they are identified with the Dioscuri; and again, as representatives of heat, breath, and life, they received the names of Lares and Penates. Their individual names are not generally mentioned; they seem (cf. Esmun = eighth) to have been merely counted. Their mode of worship was most mysterious—as indeed some of the earliest mysteries were closely connected with it.

Besides these, they also worshipped certain phenomena, personified attributes, and qualities. Their planetary divinities were the Sun and his four horses—to whose worship belongs, among others, to a certain extent the annual festival of the Resurrection of the (Tyrian) Herakles, under the emblem of a column in the form of a rising flame (Chaman); the Moon with her chariot drawn by white bulls; the planet Mars (Aziz or Nergal); Jupiter (Kochab Baal); Venus (Astoret Naamah = lovely Astarte), with her voluptuous cultus; and Saturnus (Moloch, Kronos), the evil principle. The elements were revered either in conjunction with certain duties or on their own account. The water, to which sacrifices were offered both in the shape of human beings and animals or fruits, was hallowed in all its shapes—as the sea, as rivers, fountains, lakes—by which people took their most solemn oaths; the fire, in connection with the oldest deity of P.; the light (Moloch); the air and the winds; the earth and all its plants, its forests, and glens, and trees, and more especially its mountains, as the 'symbols of the High Ones,' or as 'Faces of God,' such as Mount Carmel, Lebanon, Antilibanus, and others. Of animal-worship we have only small traces.

Abstract notions and ideas were not forgotten. The Year and the Months, Day and Night, Aurora (Lilith), Age and Youth, Art and Love, had their altars. Nor were certain professions and trades without their visible patrons. Thus, there are gods of agriculture and horticulture, like Dagon, the god of grain; a Dionysos, whose Phœnician name is lost, as the god of wine-growers; a god who is the numen of fruit-growing, of pisciculture, of mines, &c. Chthonian gods are not wanting. The god of Death—the king of the lower regions—is Muth = Death (Pluto), who is represented as a small child. His reign was shared by a goddess whose name is vaguely known as Eloti (My Goddess), and who is occasionally identified with Astarte, Dido, Anna, Persephone, Europa, and a great many other deities.

We have already touched upon the mode of worship of the Phœnicians, and the places chiefly selected for their rites. Mountains, heights, rivers, lakes, fountains, meadows, glens, were, as we said, the favourite habitations of the gods. But the Phœnicians were also amongst the first who erected temples. These were generally divided in two parts, containing the sacred arks (the mystic cists of the Greeks); and the chariots upon which the sacred objects were at times carried about. Not being intended to be prayer-houses, but as dwelling-places for special gods, they were rather small, and did not even contain the altar upon which the sacrifices were offered. This generally stood at the entrance of the temple, and around it the

priests and hierodouloi danced in their service. Pure wells and an everlasting fire were the indispensable conditions of a sanctuary. The sacrifices themselves, as far as they consisted of animals, offer great analogies to those of the Jews; but the P. also offered up human sacrifices—chiefly first-born male children, as that which the suppliant held dearest—chiefly to Baalsamin, Baal Hamon, and Astarte. Such human sacrifices, or burnt-offerings took place annually at the great festivals of expiation, and further on extraordinary occasions, at the beginning of important enterprises, such as a campaign, and in great casualties: in order to expiate by one sacrifice the sin of all. The same fanaticism which fancied the gods best pleased by the offering up of what was most precious, led the Phœnician women, like the Babylonian, to sacrifice their honour in honour of Astarte, on certain occasions, so that certain sanctuaries became hot-beds of prostitution. Circumcision—another kind of sacrifice—was not common among all the Phœnician tribes, it being a rite principally sacred to El, the god of Berytus and Byblus.

Of festivals and pilgrimages in general, we have spoken under FESTIVALS, GREEK RELIGION, &c.; and what has been observed there respecting their character in Polytheism (their being to a great extent connected with the births, deaths, resurrections, and other personal phases of special deities), holds good here. No doubt, these festivals, like those of the Hebrews, and all other ancient nations, had, beside their religious, also their political and commercial significance; and P. was more particularly, by the eminent position she held in the world's trade, a place towards which flocked, on solemn occasions, pilgrims from all parts of Asia and Africa. 'Festival Embassies,' as they were called, were despatched thither from Syria, Arabia, Babylonia, Cappadocia, Cilicia, Egypt, Armenia; nay, from India, Ethiopia, Persia, and Scythia; and not until the 5th c. A.D. did these pilgrimages to P. cease entirely. One festival, is entirely peculiar to Tyre, and strangely enough, it is still celebrated by the present inhabitants of Sur—viz., the 'Wedding of the Land-water with the Sea-water.' On these occasions, the people walk in procession to the well near the town-gate, and pour some pails of sea-water into it, in order to render it clear and sweet again for a long time.

It would be vain to try, with our scanty and adulterated sources, to gain a deeper insight into the ideas attached to the names, attributes, and modes of worship of the deities mentioned, or to speculate upon their moral influence upon the people of Phœnicia. That these were pre-eminently practical; that arts and manufactures flourished among them, more than among any other ancient nation; that they knew how to turn science into money; that they were, in fact, shrewd men of business—all this we know, but little more. Atheists or Pantheists, whichever they must be called in the modern sense of these words, it is extremely doubtful whether they, any more than the bulk of the Hebrews before the Exile, believed, as a body, in immortality. What was their influence upon Greece, Rome, the whole ancient and modern world, in the province of religious thought, we shall never have any means fully to ascertain. Comparative Mythology has a vast field to explore in this direction.

Phœnician Language and Literature.—With the exception of Greek and Latin, no language was so widely known and spoken throughout antiquity as the Phœnician; and monuments of it have been found, and continue to be found, almost all over the ancient world. We can only vaguely speculate on its early history and its various phases, so long

as our materials yield so little information on that point. Its decline seems to date from the 8th c. B.C., when Aramaisms crept in in overwhelming numbers. Finally, the close contact with, and the everywhere preponderating influence of the Greeks, superseded—chiefly after Alexander's time—the ancient language almost completely; and even coins with Phœnician legends occur not later than the 2d c. B.C.—An important Phœnician literature seems to have been extant as late as the 1st c. A.D., but it has disappeared from the face of the earth. After the second half of the 3d c., the language had vanished entirely in the country itself, and Jerome, who lived in Palestine, mentions the Punic, but never the Phœnician. In the west, it survived to a much later period. In Mauritania and Numidia, it remained, in a corrupted form, the reigning tongue as late as the 4th c. A.D.; and Augustine draws his explanations of Scripture from the Punic current in the 5th century. There was a translation of the whole Bible into Punic made for the use of the Punic Churches; and in and near Tripolis and Bizanium, it was the language of the common people up to a late period. From the 6th c., however, it rapidly died out, chiefly in consequence of the Vandals, Goths, Moors, and other foreign tribes overrunning the country, and ingrafting their own idioms upon it.

As a branch of the so-called Semitic family of the Hebrews, Syrians, Arabs, &c., the Phœnicians naturally are closely related to these also with respect to language. The affinity of the 'speech of Canaan,' as the Hebrew is called sometimes, with the Phœnician was indeed remarked at an early period. Augustine, Jerome, and Priscian pointed out already—and sometimes in order to back some very peculiar notions—how closely these two languages and their dialects were allied. Yet it must be obvious at first sight, that however near the two idioms may originally have stood to each other, the peculiar relations and fortunes of the two races who spoke them must have produced substantial changes in their structures in the course of time. While the ancient scriptural monuments of the Hebrews—outwardly and inwardly—exhibit a rare unity of idiom and form, the ancient hallowed utterance becoming a type and model for the later generations: the Phœnicians, on the other hand, not confined within the narrow limits of their home-country, but mixing freely with all the nations of the earth, spreading their own colonies far and near among them, opened a wide field for the 'development' of their language, or rather for its corruption, by its entering into alliance with Libyan in Africa, Sardinia, and Spain, and with Aramaic in Northern Phœnicia, Cilicia, and perhaps even in Cyprus. Thus it came to pass that the two languages which originally may have been identical in old Canaan became more and more widely divergent. To enter into a more detailed disquisition on this or other cognate points, we deem more hazardous now than we should have thought it ten or even five years ago; for the more ample our discoveries in Phœnician literature have become of late, the more it becomes evident that we are only at the commencement, as it were, of Phœnician philology.

What we said of the structure of the Hebrew Language (q. v.), also holds good for Phœnician to a certain extent; and we shall therefore simply point out the most palpable differences between them. In the first instance, we observe the very strange circumstance, that what is considered an archaism or an isolated dictum in Hebrew, appears as a common expression in Phœnician. Certain grammatical terminations, obsolete in Hebrew, are in use in Phœnician—so that it would appear as if the Phœnician had retained more of the ancient Canaanite speech

than the Hebrew, which gradually transformed and refined it by grammatical niceties. Another feature is the preponderance of the Chaldee, or rather Aramaic words and forms—although here again we are on very dubious ground. It might further be questioned whether our Phœnician Inscriptions—all belonging to a very late period—are not rather a faithful reflection of the Hebrew of their period, which, since the 8th c. B.C., had more and more changed into Aramaic. So much is certain, that the original language of Canaan was perfectly free from Chaldaisms, and that these are but a late corruption—such as we also find in the later books of the Old Testament. Yet there are other features quite peculiar to the Phœnician, which—although not of sufficient importance to warrant our separating the dialect entirely from the Hebrew—are of a nature not to be explained by any Semitic analogy; such as certain differences in the pronunciation of vowels, in the treatment of consonants, the formation of pronouns, some verbal forms, and certain words entirely foreign to the Semitic. Again, a distinction is to be made between the Phœnician of P. and that corrupted form of it spoken in the western colonies, called Punic, and further, that idiom peculiar to the inhabitants of Leptis, called Libyo-Phœnician—a mixture of Phœnician and Libyan, with a vast preponderance, however, of the former element.

The difference in the pronunciation may be briefly characterised as a tendency towards an obscuring or lowering, as it were, of the vowels: thus, the Hebrew *a* is changed into *o*, the *e* into *i* or *y*, *i* into *y*, sometimes into *u*, and *o* into *u*. Peculiar is also the use of the Hebrew *Ayin* as a vowel (*mater lectionis*), with the pronunciation of *o* or *u*. On some occasions, however, it is entirely omitted. The gutturals are changed at times, as in the corrupted orthography of Samaritan and Sabian, so that *L* and *R* are sometimes assimilated with the next consonant in the middle of the word, or entirely omitted, &c. As to grammar, our knowledge is extremely limited. A few undoubted facts are the termination of the nominative form in *at* instead of the Hebrew *ah*, the greater variety of genitive forms in Phœnician, the difference in the formation of the pronoun, and the identity of the article with that in Hebrew (*ha*). For the Phœnician alphabet, the model of all European alphabets, see ALPHABET.

The Literature of P., in its original form, has, as we said, perished entirely. What traces and fragments we have of it, have survived in Greek translations. But from even these small remnants, we can easily imagine the extreme antiquity, and the high importance and vast extent of these productions, which, at first, seem to have been chiefly of a theological or theogonical nature. Their authors are the gods themselves, and the writings are only accessible to the priests, and to those initiated in the mysteries. From the allegorical explanations of these exalted personages sprang a new branch of sacred literature, of which those fragments of Cosmogony mentioned above are derived. To the literary age of Taaut, Kadmus, Ophion, Esmun, &c., succeeded Thabion, Isiris, Sanchuniatho, and Mochus, who founded the schools of Priests and Prophets. These cultivated the sciences, chiefly the occult ones, magic, and the like. Nearest to the Sacred Literature stands Didactic Poetry, somewhat related to the Orphic, whose chief representatives are Sido, Jopas, &c. The erotic poetry is characterised as of a very sensuous nature, both in P. and the colonies. Of historians are mentioned Mochus, Hysikrates (Sanchuniatho?), Theodotus, Philostratus, Menander, and others; but these are mere Greek versions of

their Phœnician names, and absolutely nothing has been preserved of their writings. Punic literature is also frequently mentioned by Greek and Roman writers. Geography, history, agriculture, were the fields chiefly cultivated by the colonists of Carthage and the West generally.

The monuments that have come down to us, and which not only have enabled us to judge for ourselves of the religion, the language, and the manners of the Phœnicians, are of twofold kind—they are either legends on coins and lapidary inscriptions, or Phœnician proper nouns and texts imbedded in the works of ancient classical or sacred writers. The principal and ever-growing source for our information, however, are the monumental inscriptions, of whose existence, till the middle of the 18th c., nothing was known. The most numerous Phœnician remnants have been discovered in the colonies. Richard Pococke first found, on the site of ancient Citium (Larnaka of to-day), 31 (not 33, as generally stated) Phœnician inscriptions, which he deposited at Oxford (published by Swinton, 1750). Malta, Sardinia, Carthage, Algiers, Tripolis, Athens, Marseille, have each yielded a considerable number, so that altogether we are now in the possession of about 120 monuments, either votive tablets, or tomb inscriptions. The latest and most remarkable are those now in the British Museum, discovered at Carthage a few years ago by N. Davis, consisting of votive tablets, a (doubtful) tombstone, and a sacrificial tariff, which completes another stone found some years ago at Marseille of the same nature; both setting forth the amount of taxes, or rather the proportionate share the priest was entitled to receive for each sacrifice. Another exceedingly valuable (trilingual) inscription, referring to the gift of an altar vowed to Eshmun-Asklepios, has been discovered a year or two ago in Sardinia. See below. One of the most important historical monuments is the sarcophagus of Ashmanasar II., king of Sidon (son of Tennes?), found at Tyre in 1855, the age of which has variously been conjectured between the 11th c. B.C. (Ewald)—a most incongruous guess indeed—the 7th (Hitzig), the 6th (Duc de Luynes), and the 4th (Levy), of which we shall add the commencement, literally translated: 'In the month of Bul, in the fourteenth year that I reigned, King Ashmanasar, king of the Sidonians, son of King Tebni, king of the Sidonians—spake King Ashmanasar, king of the Sidonians, saying: Carried away before my time, in the flood of days—in dumbness ceases the son of gods. Dead do I lie in this tomb, in the grave, on the place which I have built. I myself ordain that all the nobles and all the people shall not open this place of rest; they shall not seek for treasures and not carry away the sarcophagus of my resting-place, and not disturb me by mounting the couch of my slumbers. If people should speak to thee [and persuade thee to the contrary], do not listen to them. For all the nobles and all the people who shall open this sarcophagus of the place of rest, or carry away the sarcophagus of my couch, or disturb me upon this resting-place, may they find no rest with the departed; may they not be buried in a tomb, and may no son and successor live after them in their place'; &c.

The votive tablets bear the same character throughout, differing only with respect to the name of the man or woman who placed it in a certain sanctuary in accordance with his or her vow. Their material is mostly limestone or fine sandstone, rarely marble, and they vary from 5 to 15 inches in height, from 4 to 7 in width, and from 1½ to 4 in thickness. Beginning in most cases with the dedication to the god or goddess, or both, thus: '[Sacred] To the god . . . [this tablet]

which vowed N. son (daughter) of N. When he (she) heard my voice and blessed,' or 'hear my voice and bless;' &c. The sepulchral tablets generally run somewhat in this manner: 'Stone erected to . . . , who lived . . . years.'—Much yet remains to be done. Even the palæographical side has, notwithstanding all the ready material, not been settled satisfactorily yet. One point, however, is indisputable even now. There are at least two kinds of Phœnician writing to be distinguished most clearly. The older, purer, more orthographical, and more neatly executed, is found in the inscriptions of P. herself, of Malta, Athens, Citium, and Carthage; the younger, corrupted not only with respect to the grammar and language, but also with respect to the form of the letters, which are less carefully executed, and even exhibit some strange, probably degenerate characters, is found chiefly on the monuments of Cyprus, Cilicia, Sardinia, Africa, Spain, Numidia, and the adjacent parts.

Besides these monumental sources for the language, there are a few remnants of it embedded, as we said, in ancient non-Phœnician writings. The Old Testament alone, however, has preserved its words—proper nouns chiefly—unmutilated. Later eastern writers even, not to mention the Greeks and Romans, have corrupted the spelling, to such a degree, that it is often most puzzling to trace the original Semitic words. Phœnician names occur in Suidas, Dioscorides, Apuleius, in martyrologies, calendariums, Acts of Councils, in Church

Uleaddan Lebaâl Ch[anmon A]

[Sh] Nadar Chanbaâl [Ben Âbd]
Ashmun [Shema]
[Kôl]a Barcha

To the Lady Tanith, the Face of Baal, and to the Lord Baal Chanmon [is dedicated this scil] which has vowed

Janbaâl [the son of Âbd] Ashmun [When
1e (or she) hears his voice, may he (or she) bless.]

Fathers (Augustine, Priscianus, Servus), &c. The only really important remnant, however, is found preserved—albeit fearfully mutilated and Latinised—in Plautus's *Pœnulus*, act v. s. 1 of which contains, in 16 lines, the Phœnician translation of the Latin text, with more than 100 Phœnician words. Several other phrases and words are embodied in act v. ss. 2 and 3 of the same play. Yet, although there is very little doubt among scholars about the greater portion of these texts, the corruption and mutilation which they had to

undergo, first at the hands of Plautus, who probably only wrote them by the ear, then at the hands of generations of ignorant scribes, have made more than one word or passage an insoluble puzzle.

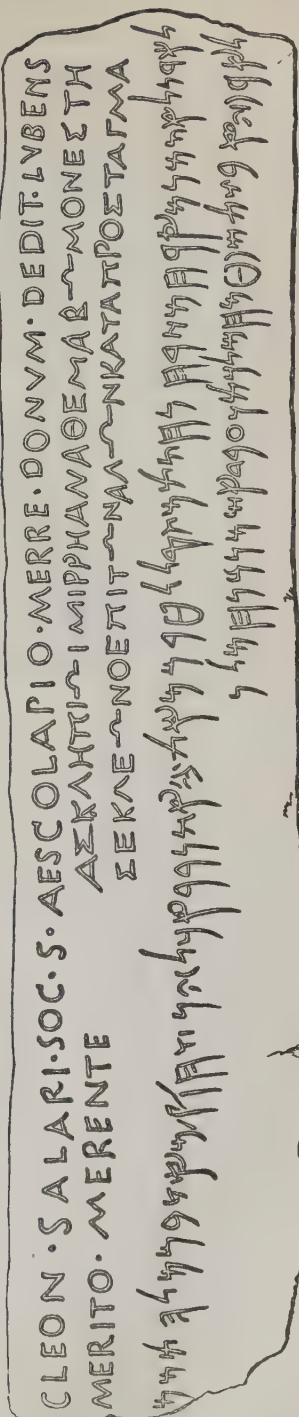

Fig. 2.

The first (Latin) division, consisting of 1½ lines, reads: 'Cleon. Salari[orum]. Soc[ietatis]. S[ocius, odalis]. Escolapio. Merre. Donum. Dedit. Merito. Merente.'

The second (Greek) division (two half lines) reads: 'Αρχαρίων Μισχ Νεχουσέθ Μισχάλ Λιτράμ Μεάθ [100] Άσ Νάδάρ Ακλιν'

The third (Phœnician) division (1½ lines) reads: 'Leadan Leeshmun Maarach Misbach Nechoseth Mishkal Litram Meath [100] Ash Nadar Aklin Shachasg Measher Mimelach Tishm[a K]jola Refia Beshat Sufetum Chamilkat Vesab Ashmun Ben Chamilk[at].'

The first of the two specimens of Phœnician [Punic] writing subjoined is taken from one of those

Carthaginian votive tablets with which the British Museum (now the wealthiest in Phœnician monuments) has lately been enriched, as mentioned before.

The emblems on it are symbolical, and refer to the deities invoked. The lower part is mutilated, but easily supplied. The date is uncertain, perhaps the 2d or 3d c. B. C.

The second is a trilingual inscription from a base of an altar, recently found at Pauli Gerrei, in Sardinia, and has been first fully explained by Deutsch. (See *Transactions of the Royal Society of Literature*, 1864.)

Its contents are briefly this: A certain Cleon, Phœnician by religion, Greek by name, Roman by nationality, a salt-farmer, vows an altar—material and weight of which are only given in Phœnician; viz., copper, a hundred pounds in weight—to Eshmun-Æsculapius 'the Healer' (the Phœnician *Mearrach*, clumsily transcribed *Merre* in Latin, and *Mirre* in Greek), in consideration for a cure to be performed. The date, given in Phœnician, viz., the year of two, apparently annual, entirely unknown judges, gives no clue to the time. Palæographical reasons, however, would place it in about the 1st c. B. C.

Among those who have more or less successfully occupied themselves with Phœnician antiquities, language, and literature, and who have also, in some instances, deciphered inscriptions, we mention Scaliger, Bochart, Pococke, Barthelemy, Swinton, Bayer, Dutens, Hamaker, Gesenius, Movers, Munck, Judas, Barges, De Saulcy, Ewald, Levy, Vaux, Renan, De Luynes, De Vogué, Deutsch, and others; to whose writings, contained either in special works or scattered in *Transactions of learned societies*, we refer for further information on the subject of our article. The principal work in German is Movers's *Phœnizier*, unfortunately left unfinished at the author's death. A useful English compilation is Kenrick's *Phœnicia* (Lond. 1855).

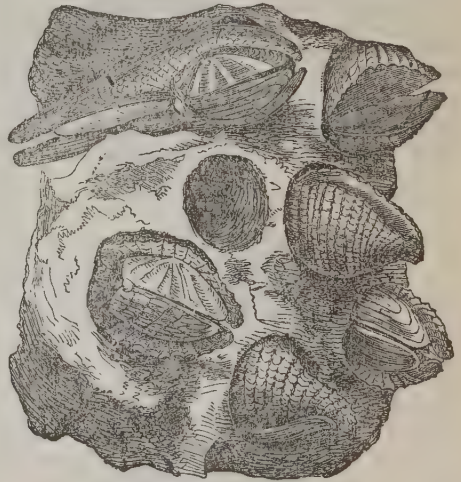

PHENICOPTERUS. See FLAMINGO.

PHœNIX, the name of a mythical Egyptian bird, supposed by some to be a kind of plover, like the *kibitz*, often depicted with human arms, and called in hieroglyphs *rekh*. Others consider it to be the *beanu*, or nycticorax, a bird sacred to Osiris, and represented watching in the tamarisk over his coffin. The first of these representations has sometimes a star upon the head, supposed to indicate the astronomical period of its appearance. It visited Egypt after the death of its father, and entered the shrine particularly dedicated to it at Heliopolis, and there buried its parent, putting the body into an egg or case made of myrrh, and then closing up the egg. Another account is, that the P., when about to die, made a nest for itself in Arabia, from which a new P. sprung of itself. This bird proceeded to Heliopolis, and there burned and buried its father. But the more popularly-known version is, that the P. burned itself, and a new and young P. sprung from the ashes. A less received version is, that a worm crawled out of the body of the dead P., and became the future one. The P. was, according to the most authentic accounts, supposed to visit Egypt every 500 years; the precise period, however, was not known at Heliopolis, and was a subject of contention till its appearance. The connection of the Phœnix period with that of the Sothic cycle, appears to be generally received by chronologists, as well as the statement of Herrepollo, that it designated the soul and the inundation of the Nile. A great difference of opinion has prevailed about the Phœnix period: according to Ælian, it was a cycle of 500 years; Tacitus seems to make it one of 250 years; Lepsius, a cycle of 1500 years. The P. was fabled to have four times appeared in Egypt: 1, under Sesostrius; 2, under Amasis, 569—525 B. C.; 3, under Ptolemy

Philadelphus, 284—246 B. C.; and lastly, 34 or 36 A. D., just prior to the death of Tiberius. The P. also appears upon the coins of Constantine, 334 A. D., viz., 300 years after the death of Christ, who was considered the P. by the monastic writers. It is supposed by the rabbins to be mentioned in Job and the Psalms.—Job xxxix. 18; Psalms ciii. 5; Herodotus, ii. 73; Achilles Tatius, iii. 25; Tacitus, *An.* vi. 28; Tselzes, *Chil.* v. 397; Lepsius, *Einleit.* p. 183; *Archæologia*, vol. xxx. p. 256.

PHENIX. See DATE PALM and PALMS.

PHO'LAS, a genus of lamellibranchiate molluscs, of the family *Pholadide*. This family, to which the Ship-worm (*Teredo navalis*) also belongs, has the shell gaping at both ends, thin, white, very hard, sometimes with accessory valves; the two principal valves beset with calcareous inequalities, connected by fine transverse parallel ridges, forming a kind of rasp, used by the animal for boring a hole in rock, wood, or other substance, in which it lives. The animal itself is either club-shaped (as in *Pholas*) or

A piece of rock bored by Pholades.

worm-shaped (as in *Teredo*), with large long siphons, often united almost to the end, and a short foot. Several species are natives of the American coasts. *Pholas Thompsonii* is very destructive to wharf timber; *Diplothyra Smithii* is found in New York harbour. How the pholades excavate the holes in which they live, sometimes in clay, but often in chalk, and even in much harder rocks, has been the subject of much dispute. It is said that they possess an acid secretion which acts as a solvent. The shell is studded with projections, in regular rows, giving it the character of a rasp or file; and the P., fixing itself firmly by its foot, which acts as a sucker, and working itself from side to side, makes use of the rasping power of its shell to enlarge its hole as it has need, so that the hole is always very exactly accommodated to the size of the occupant. There are numerous fossil species of P. in the Tertiary strata.

PHONETIC WRITING is the representation of speech by means of symbols for the elementary sounds of language. All alphabetic writing is essentially phonetic. The invention of letters was the invention of phonetic writing, as distinguished from the older pictorial, or ideographic, writing. From a variety of causes, however, no language has ever been perfectly represented by its spelling, and with the lapse of time the divergence has gone

on increasing, since the spoken words are constantly undergoing change, while the spelling tends to remain fixed. In English, more especially, this divergence has been allowed to proceed to such an extreme that it is admitted on all hands to be a serious evil, and in recent times various schemes have been projected to remedy it. It is to these schemes of radically reformed spelling that the name of Phonetic Writing is now more especially applied; and what follows, represents the views and arguments of the promoters of the movement, and sketches its history.

The earliest attempts at alphabetic writing were as strictly phonetic as the limited scheme of symbols allowed, or as the limited aim of writers required. The alphabets were confined almost exclusively to consonants; and the analysis of speech on which they were based was of course confined to the languages for which the alphabets were designed. When any old alphabet, therefore, came to be adopted for a new language or dialect, it would be found deficient in the means of writing any sounds which were not used in the language for which the alphabet was originally intended. Unless, then, new symbols were added for the new sounds, these latter must have been represented by conventional combinations of letters; and at this point the writing would cease to be perfectly phonetic.

The Sanscrit language furnishes the most convincing proof of the original phonetic character of alphabetic writing; for not only were words written exactly as they were sounded, but every change which a word underwent in utterance was consistently indicated by a change in the writing. Notwithstanding this fact, there is no language in which the etymological and grammatical relations of words are more clearly exhibited or easily traced than in Sanscrit. Our own language illustrates the same principle. No difficulty is experienced in discovering the relation between *loaf* and *loaves*, *wife* and *wives*, notwithstanding the change of *f* into *v* in the plural; nor would any difficulty be created though the *s* also were changed, as it is in sound, and the words written as they are pronounced—*lôvz*, *wivz*.

The English language embraces in its dialects almost all the elementary sounds of all languages; and the Latin alphabet, which was adopted for its writing, was so insufficient in the number of its characters, that many new letters would have been required to adapt it for the representation of Anglo-Saxon and other words. But in place of being extended, the alphabet was reverentially accepted with all its imperfections; its deficiencies were supplemented by the use of servile or silent letters, and by various orthographical expedients; and thus our writing came to be irregular, difficult, and fluctuating. The great inconvenience, however, of representing by the same character the sounds of U and V, led to the introduction of the former as a new letter for the vowel sound, and to the limitation of the latter character to the consonant sound; and the further ambiguity arising from the want of an appropriate sign for the sound of W, led to the invention of that symbol, which, being formed by joining together two of the old V characters, was thence called 'double V'—pronounced, according to the old sound of V, 'double U.' The phonetic principle was fully recognised in these changes, and they furnish precedent for further changes, when a necessity for them shall be sufficiently felt and acknowledged.

There can be no doubt that phonetic writing would greatly facilitate the acquisition of the power of reading, and consequently of the education of children and illiterate adults; as well as tend to

the reduction of dialects to one common standard, and further the diffusion of our language in foreign countries. To learn to read from perfectly phonetic characters, would be merely to learn the alphabet, and to spell would be merely to analyse pronunciation. A child at school might be made a fluent reader in a few weeks. All uncertainty of pronunciation would vanish at the sight of a word, and dictionaries of pronunciation would be superfluous.

Of all the languages which employ the Latin alphabet, the English is the worst represented; in some measure because of the rich variety of its phonic elements, but chiefly because, of all the nations which have adopted Latin letters, the English have done least to make their writing phonetic. Every attempt to correct the anomalies of our orthography has roused a host of prejudices, against which the efforts of private individuals have been powerless. The difference between phoneticians and their opponents seems to be a fundamental difference as to what really constitutes a word. The former, maintaining the *sound* to be the true word, would discard all associations dependent on letters, in order to represent the exact sound in the simplest manner; the latter, clinging to the literal associations of orthography, argue as if the verbal cluster of *letters* in reality constituted the word. The dispute is thus, in effect, between letters and sounds: which are the signs—which the thing signified?

In phonetic writing, the eye would no doubt confound such words as *know* and *no*, *see* and *sea*, *sighs* and *size*, when written separately, as in a vocabulary; but it cannot be supposed that such words would present more ambiguity in contextual usage than they now do in utterance, subject to the same confusion to the ear. At present, we have, in fact, two languages—one purely phonic, addressed to the ear; and the other, in some degree etymological or historical, addressed to the eye. In this respect, we are in a similar position to the Chinese, with their classical ideographic language of literature, and their multitudinous vernacular dialects. In order to establish the assertion, that the phonic word (the sound) written phonetically in a sentence would be less intelligible to the eye than the written word in its present form, it is incumbent on the opponents of phoneticism to shew that the simple phonic word is now less intelligible when pronounced in a sentence, than its written symbol is when read in a sentence.

The principal objection urged against phonetic writing is, that it would obscure the etymological history now discoverable in the orthography of a word. The best answer to this objection is that the traces of etymology, preserved in the present spelling, are so imperfect and inconsistent as to be of little value compared with the embarrassments they occasion in other respects.

The first requisite for the construction of a phonetic alphabet is an exact knowledge of elementary sounds, that every element may be provided with its appropriate symbol, and that no more symbols may be introduced than there are distinct elementary sounds. The latter consideration would be of importance only in connection with a general alphabet available for all languages. An alphabet for any individual language might contain symbols for compound sounds, with no other disadvantage than that of adding to the number of symbols. It would not, for instance, be of any consequence, so far as phonetic writing is concerned, whether the word *sacks* were represented by the letters *saks*, *sacs*, or *sax*, so that the symbols used were invariably appropriated to the same sounds. Orthoepists and phoneticians are not agreed as to what elements compose many of

our compound sounds, such as those heard in the words *chair, queen, tune, I, out, &c.* Any attempt, therefore, at representing compounds analytically would be premature, until the analysis of the compounds had been settled. This analysis would be absolutely necessary for a general alphabet, but not so for an alphabet for any single language. Phonetic writing, then, should be separately considered, as a means of representing the elementary sounds of all languages, and as a method of symbolising the pronunciation of any one language only. We shall now shew the nature of the attempts that have been made for the phonetic writing of English.

Dr Franklin, in 1768, proposed a phonetic alphabet for English, in which new symbols were introduced for the vowels heard in the words *on* and *up*, and the four consonants heard in the words *she, they, and thing*. Many other schemes have been from time to time proposed; but the only alphabets which have been practically applied on a large scale are those of Dr Comstock in America, and Messrs Ellis and Pitman in England. The object of experimenters in this department has generally been to make use of existing letters as far as possible, and only to supplement deficiencies by new forms. The common alphabet has been made to furnish almost a sufficient number of characters by the inversion of some of its letters—thus, *A, Δ, ε, o, e, Z, q, &c.*, as in the 'Anti-absurd' alphabet of Major Beniowski; but the best scheme of phonotypes that has yet been introduced was the joint production of Mr Isaac Pitman, the inventor of the first system of phonetic shorthand writing, and Mr A. J. Ellis, B.A. of Cambridge, a most accomplished mathematician and linguist. This alphabet was completed in 1847; and the experiment of its introduction was carried out with great diligence and perseverance by its promoters, until an army of philanthropic assistants became enlisted in all parts of Great Britain and America. Primers and school-books were issued, and tested on juvenile and adult classes; many works of standard literature, and even the entire Bible, were translated into the new spelling; magazines were published, and ultimately a newspaper, printed in the phonetic character, was started by the enterprising orthographic reformers. In this scheme of phonotypes, diphthongal and articulate compounds were not analysed, and the letters of the ordinary alphabet were retained in their most common signification, seventeen new characters being introduced for unrepresented or ambiguously written sounds. The forms of these were, in most cases, happily suggestive of the displaced orthography, and the general aspect of the writing bore such a resemblance to common typography, that any good reader of the latter could decipher the new printing with ease, after a very brief study of the alphabet. The ordinary vowel letters (*A, E, I, O, U*) were pronounced as in the words *am, ell, ill, on, up*; the consonants *C* and *G* were sounded as in *came* and *game*; the letters *K, Q, X* were rejected as superfluous, and all the other letters of the common alphabet were retained, with their established sounds. Comparing this scheme of letters with the tabulated elementary sounds of English, we find that it represents all the vowels, except the nice varieties heard in the words *air, ore, err, ask*; and that all the consonants are accurately represented except *wh*. The latter element is written by letters sounding *hoo*, so that the words *where* and *who'er* are made identical to the eye; and the sentence, 'I saw the man *whet* the knife,' is written, 'I saw the man *who* ate the knife.'

Notwithstanding these imperfections, this alphabet was found to work well among those who were disposed for a reform. The phonetic method was

proved to be remarkably simple and easy in comparison with the ordinary system; the time occupied in making fluent readers was greatly reduced; and readers of phonetic printing experienced but little difficulty in the transition to reading from common orthography.

The advantages claimed for the system were chiefly: rapidity of learning to read, certainty of pronunciation, and increased facility in common reading, after the power of phonetic reading had been acquired. The chief disadvantages alleged against the system were: accustoming the eye to a false orthography, and teaching what had to be in great part unlearned after it was acquired. Whether the objectors were right or wrong, they were overpoweringly numerous, and the system failed to do more than prove that phonetic spelling greatly simplifies the acquisition of the power of reading.

The original phonotypic alphabet, described above, has been for some years discarded in the printing issued from the 'Phonetic Institution' (Bath), and a more analytic alphabet has been adopted, in which *eleven*, instead of seventeen, new forms are introduced. The latest edition of this alphabet gives the ordinary vowel letters *A, E, I, O* for the sounds in the words *am, ell, ill, on*, and the letter *U* for the sound in *pull*; *K* is restored, and *C* rejected; *J* is used as in French; and the elementary sound of *wh* is still unacknowledged. The eleven new characters represent the consonants in the words *she, oath, they, and (s)ing*; and the vowels in the words *ale, eel, alms, old, all, pool, up*.

The following are the forms of the new letters as printed and written, with a passage exhibiting their appearance in composition.

This Phonetic Alphabet consists of 34 letters, viz, the 23 useful letters of the common alphabet (*c, g, and x* being rejected), and the 11 new ones below. *J* is used for the French *j* (*zh*), or *g* in 'edge,' or *s* in 'vision;' hence *dj* represents *J* in *John*, and *dj* in *edge*. *Tg* (*t sh*) represents *ch* in *chess*, and *tch* in *catch*. *Y* and *w* are consonants; *wh* being replaced by *hw*. The vowels *a, e, i, o, u* have invariably the short sounds heard in *pat, pet, pit, pot, put*. All the other old letters have their usual signification. The italic letters in the words in the third line denote the SOUNDS of the letters.

VOWELS.

A a E e I i — O o U u — J j

A a E e I i — O o, O o, U u — J j

alms, age, air, eat — all, ope, food — son, but, smz, edj, er, it — ol, ep, fud — son, but

DIPHTHONGS.

CONSONANTS.

si, ei, oi, ou. || C c, R r, A a, W w.

ai, ei, ai, ou || L l, N n, B b, Z z

ay, by, boy, now. she, thin, then, sing.

ai, bei, boi, nou. ci, bin, den, sip.

The double letter *u*, as in *unit, unite, duty, value*, is written thus: "yunit, yuneit, diuitt, valiu." When *ai, ei* make a dissyllabic diphthong, the second letter is marked with a dieresis; thus, *soifaiy, soiy.*

"Tiz de meind dat meks de bodi ritq;
and az de ssn breks bru de darkest klouds,
so onor 'pireb in de minest habit.
?Hwot! ?iz de dje mor preqs dan de lark,
?ikoz hiz federz ar mor biutiful;
or ?iz de ader beter dan de il,
?ikoz hiz pented skin kontents de ef.
O no, gud Ket; neider art dou de wste
for dis pur fsrnitry and min ara."

The reduction in the number of letters from that in the Ellis and Pitman alphabet is obtained chiefly at the expense of the phonetic principle, in the attempt to analyse diphthongs in writing, before their correct phonic analysis has been ascertained and settled. Thus, the compound sound in the word *use*, before represented by a single character, is now analysed into the elementary vowels heard in the words *ill* and *pool*; the diphthong in the word *owl* is analysed into the elementary sounds in *on* and *pull*; and the diphthong in the word *isle* is analysed into the elements heard in *ell* and *ill*.

The original phonotypic alphabet was of proved value as an initiatory alphabet, from which the transition to reading from ordinary orthography was easy, and on this ground it had many advocates; the recent modifications, which are doubtful improvements, have been introduced apparently with the view rather of superseding established orthography, and on this ground, it is to be feared, the 'reformed' phonetic alphabet will meet with comparatively few supporters.

But the full advantages of the phonetic principle are not secured to the learner while phonetic writing is used only as introductory to common reading. Phonetic spelling would require to be authoritatively established, so as to be irrefragable in ordinary use, otherwise the learner has still to master the more difficult orthography after the phonetic mode has been learned. At present, spelling is the test of a good vernacular education, and the applicability of this test phonetic writing tends to destroy.

But may not the advantages of phoneticism, so far as simplifying the acquisition of reading is concerned, be obtained by the phonetic teaching of ordinary letters, and without any alphabetic change? Such a result is undoubtedly practicable, as by Mr Bell's method (in his nursery-book of *Letters and Sounds*) of shewing the orthography of a word and its sound together, and teaching the latter only while the learner's eye is accustomed to the former also. Thus, the words *loaf*, *debt*, *wife*, *wreath*, *straight*, &c., are printed *loaf*, *debt*, *wife*, *wreath*, *straight*, &c. The associations of orthography are chiefly fixed by the eye, and this plan for learners preserves the pictorial aspect of words, and shews at once the phonetic spelling and the established orthography.

But the question recurs: Why should established orthography be unphonetic? Or, at least, why should not some national measures be adopted to correct the anomalies of our spelling? A similar work was undertaken by the Spanish Academy in the middle of last century, and carried out so efficiently that, at the present day, the pronunciation of any word in Spanish is immediately determined with certainty by every reader who merely knows the phonetic value of the alphabetic characters. The writing of the Italian, Dutch, and many other languages has also been successfully phoneticised. A similar result would be attained in English, if the work of orthographic revision were submitted to a competent tribunal, and if such changes as might be found necessary were duly sanctioned by authority. New letters should be added to the alphabet for the six unrepresented simple consonant sounds, *Sh*, *Zh*, *Th*, *Dh*, *Wh*, *Ng*; or, at all events, the writing of these elements should be made distinctive; and, with a few rules for distinguishing the vowel sounds, little alteration of spelling would be needed to approximate the writing of English to phonetic accuracy.

A general phonetic alphabet, available for the writing of all the sounds of human speech, is still a scientific desideratum. Such an alphabet would be

of great practical value to travellers, colonists, missionaries, and philologists. Much attention has been paid to this subject of late years. In 1854, a conference of philologists was held in London, at which two rival alphabets were produced, one by Professor Lepsius of Berlin, and another by Professor Max Müller of Oxford. The former has been adopted by the Church Missionary Society, but so many local diversities in the value of the characters have been found necessary in different countries, that this 'Universal Alphabet' has been practically split up into several alphabets. The writing is, besides, overlaid with diacritical points. In the alphabet of Professor Max Müller, the latter difficulty is obviated by a free use of compound letters. The *Lectures on the Science of Language* by this author may be consulted with great advantage, both as to the physiology of speech and the history of words. In the second series of these Lectures, diagrams of the organic formation of many of the elements of speech are given, as well as a comparative table of four alphabets that have been used in the transcription of Sanskrit, and numerous references to the works of continental and other writers who have treated of the science of phonetics.

The most elaborate scheme of a universal alphabet hitherto published is that of Mr A. J. Ellis. In this alphabet 94 sounds are discriminated by means of an ingenious system of compound letters, but the complexity of the writing forbids the possibility of its 'universal' adoption.

The chief difficulty in the construction of a universal alphabet has arisen from the want of a complete classification of elementary sounds; another difficulty has been created by an adherence to the inadequate letters of the Roman alphabet. The resolutions of the alphabetic conference were decidedly in favour of Roman letters as the basis of the proposed 'standard' alphabet. But the wisdom of this decision may be questioned. No existing alphabet exhibits the natural relations of the sounds it represents; and, consequently, although an alphabet physiologically complete were framed, it could not incorporate Roman, Greek, or any other letters at present in use, without sacrificing the most essential qualities of a universal alphabet—simplicity and congruity. Symbols must be devised which would indicate to the eye all the organic relations discoverable by the ear between the various elements, and which would be free from the associations that would attach to adopted letters familiar to the eye with other meanings.

A general or panethnic alphabet must, of course, embody an exhaustive classification of sounds, and its characters should be designed to be pictorially suggestive of the organic actions which produce the sounds, so as to be universally intelligible. In this way, a person who had never heard the language or the sound might pronounce it from the physiological writing, if he were only acquainted with the modes of action of the organs of speech, and the representative principle of the alphabet. By means of such a scheme of symbols, all the sounds of every language, including even the laugh, the sigh, the murmur, the groan, the snore, the lisp, the burr, and the imitative sounds practised by ventriloquists, as well as the modulative distinctions of the Chinese, the Hottentot Clicks, and the peculiar inspiratory sounds indulged in by savages, might be represented phonetically with the utmost directive precision, and by a wonderfully small number of radical characters. If ever the utopian dream of a universal language is to be realised, its alphabet must be phonetic, and its elementary symbols not selected from old alphabets, but new, designed from the mouth, pictorial or analogical,

and forming a 'visible speech.' See **VISIBLE SPEECH**. Phonetic writing on such a basis would not encounter the prejudices that have hitherto defeated the efforts of orthographic reformers; and it would be of considerable immediate service to linguists, besides being a beginning and a promise of the widest utility. For phonetic shorthand writing, see **SHORTHAND**.

PHONOMANIA. See **HOMICIDAL MANIA**.

PHOSGENE GAS, known also as **OXYCHLORIDE OF CARBON** or **CHLOROCARBONIC ACID**, **CHLOROCARBONIC OXIDE**, and **CHLORIDE OF CARBONYL**, is represented by the formula COCl_2 . It is a colourless, suffocating gas, which is formed by exposing equal measures of carbonic oxide and chlorine to the direct action of the sun, when they combine and become condensed into half their volume. It does not possess any acid characters, but water decomposes it into carbonic and hydrochloric acids, as is shown by the equation $\text{COCl}_2 + \text{H}_2\text{O} = \text{CO}_2 + 2\text{HCl}$. This gas is of great interest in relation to the artificial production of Urea (q. v.) from inorganic matter.

PHOSPHATES (in Physiology). The following phosphates* play an active part in the chemistry of the animal body.

Phosphate of Sodium, which may occur under any one of the three forms NaH_2PO_4 , or Na_2HPO_4 , or Na_3PO_4 . All these salts are soluble in water; and the first two have an acid reaction, while the third is alkaline. By exposure of the second of these salts (Na_2HPO_4) to a red heat, it is converted into what is termed *pyrophosphate of sodium* ($2\text{Na}_4\text{P}_2\text{O}_7$), in which the phosphoric acid is obviously no longer tribasic, but bibasic; and by similarly treating the first of these salts (NaH_2PO_4), we convert it into the so-called *metaphosphate of sodium* (NaPO_3), in which the phosphoric acid is monobasic. It is in consequence of these changes under the action of heat, that the terms *pyrophosphoric* and *metaphosphoric* have been used as synonyms for *bibasic* and *monobasic phosphoric acids*. Phosphate of sodium, in one or other of the above forms, occurs as a constituent of all the animal fluids and soft tissues of the body, but is especially abundant in the urine and the bile. There are reasons for believing that it is the second and third of these salts which occur as constituents of the animal body, although the first may possibly sometimes be found. Pyrophosphate and metaphosphate of sodium are often found in the ashes of animal fluids or tissues after the process of incineration, but they merely result from the action of heat on the two other salts. The following remarks on the derivation, elimination, and physiological importance of the phosphate of sodium, are equally applicable to the corresponding salts of potash, which are always associated with them. The phosphates of the alkalies, which occur in the animal body, obviously owe their origin, either directly or indirectly, to the food; viz., directly, by being ingested as phosphates of the alkalies; or indirectly (within the system), by the action of phosphate of lime on salts of the alkalies. The elimination of these salts from the system is necessary, because they are being constantly supplied by the food; and this process is effected mainly by the kidneys and the intestinal canal. In the carnivorous animals, whose blood is much richer in phosphates than that of herbivora (the ash of the blood of the dog, for example, contains from 12 to 14 per cent. of phosphoric acid, while that of the ox or

sheep does not contain more than from 4 to 6), these salts are carried off by the urine; but in consequence of the formation of free acids as products of the disintegration of the tissues, a portion of the base is abstracted from the originally alkaline phosphates, and a corresponding portion of phosphoric acid is liberated. The originally alkaline salt is thus rendered neutral or even acid; and the occurrence of the acid phosphate of sodium (Na_2HPO_4) in the urine is thus explained. In the herbivorous animals, on the other hand, the urine contains no phosphates, the whole of the phosphoric acid taken in their food being eliminated by the intestinal canal in the form of the insoluble phosphates of lime and magnesium. Although the general distribution of the phosphates of the alkalies in the nutrient fluids (there is 40 per cent. of them in the ash of the blood-cells; 28·4 per cent. of phosphoric acid and 23·5 of potash in the ash of cow's milk; and about 70 per cent. of phosphoric acid in the ash of the yolk of egg) is in itself an indication of their importance, the exact nature of their functions is not completely understood. Liebig has specially drawn attention to the peculiar grouping of the acid and alkaline fluids of the animal body. The permanence of this grouping is chiefly maintained, especially in herbivorous animals, by the conversion, within the body, of alkaline and neutral phosphates into acid phosphates by the means already described. Moreover, all tissue-forming substances (the protein bodies) are so closely connected with phosphates, that they remain associated during the solution and subsequent re-precipitation of these substances; and the ash of developed tissues (such as muscle, lung, liver, &c.) always affords evidence that acid phosphates existed in the recent tissue; and, further, no exudation from the blood-vessels can undergo transformation into cells and fibres, or, in other words, become organised, unless, in addition to other conditions, phosphates are also present. Another very convincing proof of the share taken by the phosphates in the formation and functions of the tissue, is the fact, that although herbivorous animals take up a very small quantity of phosphates in their food, and although their blood is very poor in these salts, their tissues contain as large a proportion of phosphates as the corresponding parts of carnivora. Lastly, the fact, that one equivalent of the alkaline phosphate of sodium (Na_3PO_4) possesses the property of absorbing as much carbonic acid as two equivalents of carbonate of soda, leads us to the belief, that the power of attracting carbonic acid, which the serum of the blood possesses, is due at least as much to the phosphate as to the carbonate of soda, and that, consequently, phosphate of soda plays an important part in the respiratory process.

Phosphate of Calcium occurs in the organism in two forms, viz., as the neutral or tricalcic orthophosphate, $3\text{Ca}_2\text{O} \cdot \text{P}_2\text{O}_5$, and the acid phosphate, $2\text{CaH}_4\text{P}_2\text{O}_8$. The neutral phosphate occurs in all the solids and fluids of the body, but is most abundant in the bones, in which it amounts to about 57 per cent.; and in the enamel of the teeth, in which it ranges from 80 to 90 per cent. It may at first sight appear inexplicable how a salt so perfectly insoluble in water as neutral phosphate of calcium can be held in solution in the animal fluids. In some fluids, as the blood, it is probably, in part at least, combined with albumen, with which it forms a soluble compound; while in other fluids, as the urine, it is held in solution by a free acid or by certain salts (as, for example, chloride of sodium), whose watery solutions are more or less able to dissolve it. If any proof is wanted of the functions of this salt in relation to the bones, it is afforded by the well-known experiment

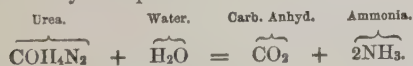

* The means of distinguishing between the salts of tribasic, bibasic, and monobasic phosphoric acid, are given in the article **PHOSPHORUS**.

of Chossat, who shewed that when too small a quantity of it is taken with the food, the bones lose more or less of their hardness and firmness, and fractures do not readily unite. Phosphate of calcium, like the phosphates of the alkalies, is indispensable to cell-formation; and as a good illustration of this fact, it may be mentioned that in the mantle of the molluscs (where new cells for the formation of shell abound) this salt is far more abundant than in any other part of the body. Although by far the greater quantity of the phosphate of calcium found in the body has doubtless pre-existed in the food, yet it is unquestionable, that a part of it is formed within the organism by the action of carbonate of lime on the phosphoric acid that is produced during the disintegration of the phosphorus-containing tissues, such as the brain, for example. In man and carnivorous animals, a certain portion of the phosphate of calcium is eliminated by the kidneys, and the rest is carried off in the excrements; while in herbivorous animals the whole is carried off in the excrements. The acid phosphate of calcium is occasionally found in the urine of man and carnivorous animals, but is of no practical importance. For a notice of the amount of earthy phosphates daily eliminated by the kidneys, the reader is referred to the article URINE.

Basic Phosphate of Magnesium, $3Mg_2P_2O_8$, is analogous, both in its chemical and physiological relations, to the corresponding salt of lime, with which it is always associated. The abundance of this salt in the seeds of the cereals, and in the other ordinary articles of vegetable diet, sufficiently explains its presence in the system. A far less amount of this salt, than of the corresponding lime-salt, seems to be required by the organism, as is shewn by the relative quantities in which they occur in bone (57 of the former to 1·3 of the latter), and as is further indicated by the fact, that, relatively, far more of this than of the lime-salt escapes intestinal absorption, and appears in the excrements.

The only phosphates remaining to be noticed are the *phosphate of ammonium and magnesium*, or, as it is sometimes termed, the triple phosphate, $(NH_4)_2Mg_2H_2P_2O_8 \cdot 3H_2O$, which occurs in beautiful prismatic crystals in alkaline urine, and, indeed, in any specimen of urine that is beginning to putrefy, and the *phosphate of sodium and ammonium*, which is occasionally found as a crystalline sediment in putrid urine.

PHOSPHATIC DIATHESIS, in Medicine, designates the condition in which there is a tendency in the urine to deposit *white gravel*. As the deposit of lithates (see LITHIC ACID DIATHESIS) depends upon an excessive acidity of the urine, so that of the phosphates is determined by the opposite condition—namely, by deficient acidity, or by positive alkalescence. Alkalescence of the urine may occur from two distinct causes—viz. (1) from the presence of the carbonate of a fixed alkali (potash, or soda), or of alkaline phosphate of soda (see PHOSPHATES, in Physiology); or (2) from the presence of the carbonate of the volatile alkali, ammonia, which is due to the decomposition of urea. This decomposition is due to the fermenting action of the mucus of the bladder on the urea, and is explained by the equation—

The white gravel which is deposited in the second of these conditions—viz., when the urine contains carbonate of ammonia—is composed of minute shining prismatic crystals of the triple phosphate of ammonium and magnesium, whose formula is given in the article PHOSPHATES. This salt is formed as follows: Healthy urine contains phosphate

of magnesium in a state of solution. If, however, the urine become alkaline from the decomposition of the urea, a portion of the ammonia combines with the phosphate of magnesium, and forms the triple salt which is insoluble in the urine, which has now become alkaline. With this triple phosphate, there is almost always an admixture of phosphate of calcium ($3CaO \cdot P_2O_5$) in the form of an amorphous precipitate. The tendency to deposit the mixed phosphates (triple phosphate and amorphous phosphate of calcium) is especially observed in cases of disease or injury of the spinal cord, and in disease of the bladder, particularly in chronic inflammation of its mucous coat. Upon allowing urine of this kind, which is usually pale in colour, to stand for some time, an iridescent film or pellicle generally forms upon its surface, which, when examined under the microscope, is found to consist mainly of the salts we have described. Such urine speedily becomes putrid, and evolves a strong ammoniacal odour.

The above is by far the most common form of the phosphatic deposits, but, as has been already stated, the urine may become alkaline from the presence of the carbonate of potassium or sodium; and then, no ammonium being present, in place of the triple salt, there is a deposition of amorphous phosphate of calcium, or, in rare cases, of a crystalline stellar phosphate, whose composition, according to Dr Bence Jones, is represented by $2CaO \cdot HO \cdot PO_3$ (*Journ. of Chem. Soc.* vol. 15). In these cases, the urine is alkaline, pale, copious, slightly turbid, of low specific gravity, and of a peculiar odour. This urine makes reddened litmus paper *permanently* blue; while ammoniacal urine causes only a temporary change in the colour of the same test-paper. As the urine cools, and sometimes even in the bladder, the white sand is deposited, occasionally giving the last portion of the excreted urine a milky appearance. During perfect health, the urine often becomes temporarily alkaline during the act of digestion (when the gastric juice is especially acid); but as a general rule, the tendency to alkalescence from a fixed alkali, and therefore to phosphatic deposits, is associated with general debility. These deposits occur for the most part in sallow, languid, unhealthy-looking persons, whose vital energies have been depressed by mental anxiety, by insufficient food, or by sexual excesses.

In both forms of alkaline urine, and therefore of phosphatic deposits, a generous diet and tonics, such as bark, wine, and the mineral acids (given before meals), are of great service; and opium is usually of great value, if judiciously administered. Small doses of benzoic acid, twice or thrice a day, with the view of restoring the acidity to the urine, and the occasional washing-out of the bladder with tepid injections, have been also found serviceable in the ammoniacal form of the disease.

PHOSPHORESCENCE. Strictly speaking, the term is applied to the phenomenon, exhibited by certain bodies, of remaining luminous in the dark for some time after being exposed to a strong light. In this sense, it is strictly analogous to, perhaps we should say, identical with, the heating of bodies by exposure to light or radiant heat. They absorb part of the energy of the vibrations which fall on them; it becomes motion of their particles; and is again radiated from them as light or heat. Certain preparations, such as Canton's Phosphorus (q. v.), indurated limestone, &c., possess this true phosphorescence in a very high degree. With the great majority of phosphorescent bodies, however, the duration of the phenomenon is very short, rarely more than a small fraction of a second. Becquerel, who has recently studied this phenomenon with great care, has invented a very ingenious instrument

for the purpose, called a *phosphoroscope*. The body to be tried is placed in a small drum, which has an opening at each end. In this drum there revolve two discs, mounted on the same axle, and pierced symmetrically with the same number of holes. They are so adjusted, that when a hole in one disc is opposite to the hole in the corresponding end of the drum, the second disc closes the hole at its end of the drum, and *vice versa*. Light is admitted by one of the holes in the drum, so as to fall on the object, and it is examined through the other hole. It is obvious that when the discs are made to revolve, the object is alternately exposed to light, and presented to the eye. By a train of multiplying wheels, these alternations may be made to succeed each other as rapidly as the observer pleases, and thus the object is presented in the dark to his eye as soon after its exposure to light as may be desired. Almost all bodies are found to be phosphorescent; for instance, some kinds of pink rubies, when exposed to sunshine in this apparatus, appear to glow like live coals in the dark. The phenomenon is, in fact, precisely that which was observed by Brewster and Herschel in quinine and certain crystals of fluor-spar, and thence called *Fluorescence*. Stokes was the first to give the true explanation of these facts, and he shewed it to depend upon the change of refrangibility (i. e., colour) which light suffers on being absorbed and then radiated by the fluorescent substance. The green colouring-matter of leaves, a decoction of the bark of the horse-chestnut, and the common *canary glass* (coloured with oxide of uranium), are bodies which exhibit this phenomenon very well. Perhaps the most striking method of studying the phenomenon is to receive in a darkened room the solar Spectrum (q. v.) on a sheet of white paper; and to pass over the coloured spaces a brush dipped in a solution of sulphate of quinine with sulphuric acid. No change is produced on the less refrangible rays, but in the blue and indigo spaces, a strange change of colour is at once apparent where the liquid has been spread. This appears more strongly in the violet, and vividly in the spaces beyond the violet, where rays fall which excite no luminous sensation in the eye. By this experiment, the visible length of the spectrum may easily be doubled. By using the electric light, which is peculiarly rich in these highly refrangible rays, a prism of quartz, which allows them to pass very freely, and various fluorescent substances, Stokes has obtained spectra six or eight times as long as those otherwise visible. The characteristic of all these rays is, that they are *less* refrangible than those from which they are produced. The entire phenomenon is identical in principle with Leslie's photometer, in which light was measured when changed into heat by absorption, in the coloured glass of which one of the bulbs of his differential thermometer was formed.

Ordinary phosphorus (from which the phenomenon took its name) becomes luminous in the dark by slight friction; whence the common trick of drawing self-luminous figures on doors and walls with a stick of phosphorus, or an ordinary lucifer-match. A similar appearance is presented by putrescent animal matter, such as decaying fish, &c.; but these are effects of slow combustion, or chemical combination, and are not properly classed among the phenomena of phosphorescence. See LUMINOSITY OF ORGANIC BEINGS.

PHOSPHORUS (symb. P, equiv. 31, sp. gr. 1·826) is one of the metalloids, or non-metallic elements, although, in its combining relation, it is more closely connected with the metals arsenic and antimony than with any of the members of the sulphur-group, in which it is commonly placed.

This substance affords an excellent example of allotropy; that is to say, it may be made to occur under different forms presenting different properties. See ALLOTROPY.

Ordinary phosphorus and the red variety are the only important forms. We shall speak of them as phosphorus and red phosphorus respectively.

Phosphorus at ordinary temperatures is an almost colourless or faintly yellow solid substance, having the glistening appearance and the consistence of wax; and evolving a disagreeable alliaceous odour, which, however, is probably due to the action of the oxygen of the air upon it. It fuses at 111·5° into a colourless fluid; and if the air be excluded, it boils at 555°, and is converted into a colourless vapour of sp. gr. 1·826. If, however, it be heated to about 140° in the air, it catches fire, burns with a brilliant white flame, and is converted into phosphoric acid; and, indeed, it is so inflammable that it will catch fire at ordinary temperatures by mere friction. As the burns which it occasions are often severe and dangerous, great caution is required in handling it; and in consequence of the readiness with which it catches fire, and of its tendency to oxidise when exposed to the air at a temperature higher than 32°, it is always kept in water, in which it is insoluble. It is slightly soluble in ether, but dissolves freely in benzol, in the fixed and essential oils, and in bisulphide of carbon; and by allowing its solution in one of these fluids to fall upon filtering paper, the finely divided phosphorus absorbs oxygen so rapidly as spontaneously to catch fire as soon as the solvent has evaporated. One of the most characteristic properties of phosphorus is that it shines in the dark, probably from the slow combustion which it undergoes; and hence its name from the Greek words *phōs*, light, and *phōros*, bearing. Its power of forming ozone is noticed in the article on that substance. Taken internally, phosphorus is a very powerful irritant poison; and it is the active ingredient of some of the preparations employed for the destruction of vermin. Its fumes give rise to a peculiar form of necrosis of the jaw, which is very common amongst the makers of lucifer-matches, and is not followed, as in ordinary necrosis, by a formation of new bone.

Red phosphorus differs from the ordinary variety in several important points. It occurs as a deep red amorphous powder, which is perfectly devoid of odour, may be heated to nearly 500° without fusing, has a specific gravity of 2·10, does not shine in the dark, nor take fire when rubbed, undergoes no change on exposure to the air at ordinary temperatures, and is in all respects far less inflammable. Moreover, it is insoluble in bisulphide of carbon and the other fluids in which ordinary phosphorus dissolves, and is not poisonous. On this account, Schrötter (to whom we are mainly indebted for our knowledge of this modification of phosphorus) has attempted, although with imperfect success, to apply it to the formation of lucifer-matches. When red phosphorus is heated in an atmosphere of carbonic acid to a temperature of 500°, it is converted, without loss of weight, into ordinary phosphorus.

Phosphorus is never met with in nature in an uncombined state, but it occurs in small proportions as phosphate of calcium in the primitive and volcanic rocks (as was first shewn by Fownes in 1844), by the gradual decay of which it passes into the soil; it is also found abundantly in the minerals known as *apatite* and *phosphorite*, and in the brown rounded pebbles which abound in the Norfolk Crag, and which, under the name of *coprolites*, are much employed, when crushed, for manure. From the soil, it is extracted by plants, which accumulate it

(especially in the seeds of the cereals) in quantity sufficient for the wants of the animals which they supply with food. In the animal system, phosphate of lime forms 57 per cent. of the bones; phosphates of the alkalies, especially of soda, occur freely in the animal fluids; and in fibrin, albumen, and nervous matter, phosphorus is universally present, although we do not clearly know in what form of combination it occurs.

Phosphorus was originally discovered in 1669 by Brandt, a Hamburg chemist, who obtained it from urine. Gahn and Scheele were, however, the first to discover its presence in bone, and to employ that material for its preparation. The following are the leading steps of the method now usually employed in obtaining it on the large scale. Bones are burned to whiteness, and powdered; and this bone-ash is then mixed with sulphuric acid in such quantity as partially to decompose the phosphate of calcium occurring in the ash ($3\text{Ca}_2\text{O.P}_2\text{O}_5$) into insoluble sulphate of calcium, and a soluble superphosphate of calcium, whose composition is represented by the formula $\text{Ca}_2\text{H}_4\text{P}_2\text{O}_8$. The solution of the superphosphate is evaporated to a syrup, mixed with charcoal, and submitted to distillation in an earthen retort exposed to a red heat. Phosphorus rises in vapour, and is conveyed, by means of a bent tube, into water, in which it condenses in yellow drops. Two distinct processes take place within the retort. The first consists in the decomposition of the superphosphate of calcium into bone earth and hydrated phosphoric acid; while the second consists in the deoxidation, by means of the carbon, of the liberated phosphoric acid into phosphorus—a process accompanied by the evolution of hydrogen and carbonic oxide gases. After it has been pressed in a fused state through wash-leather, and further purified, it flows through a glass tube immersed in cool water, and is drawn out as a solid cylinder, which may be cut into sticks of any required length.

Phosphorus forms with oxygen three anhydrous oxides—viz., suboxide, P_4O ; trioxide, phosphorous oxide, or anhydride, P_2O_3 ; pentoxide, phosphoric oxide, or anhydride, P_2O_5 ; and an acid to which there is no corresponding anhydride, the hyposulphurous, PH_3O_2 . Of these compounds, phosphoric anhydride is by far the most important. The anhydrides unite with water and form phosphorous acid ($\text{P}_2\text{O}_3.3\text{H}_2\text{O}$, or PH_3O_3) and phosphoric acid ($\text{P}_2\text{O}_5.3\text{H}_2\text{O}$, or PH_3O_4), respectively.

Phosphoric acid in its anhydrous state, or *phosphoric anhydride*, is represented by the formula P_2O_5 , and is obtained by burning phosphorus in a jar of perfectly dry atmospheric air or oxygen, when it is deposited in snow-white flakes at the bottom and on the sides of the jar, from whence it must be removed by means of a platinum spatula as quickly as possible, in consequence of its attracting moisture from the atmosphere, and placed in a perfectly dry flask. When dropped into water, it combines with it, and dissolves, evolving a considerable amount of heat, and emitting a hissing sound, as when red-hot iron and water come together. In consequence of its strong affinity for water, this anhydride is very useful in the laboratory as a desiccating agent.

The occurrence of phosphoric acid (in a state of combination) in the three kingdoms of nature has been already noticed in our remarks on phosphorus. The discovery of the acid was made in 1740 by Marcgraf; the discovery of its true chemical nature is, however, due to Lavoisier; and that of its various modifications and its polybasicity, to the investigations of the illustrious English chemist Graham.

Phosphoric oxide or anhydride unites with water in three proportions, forming three acids, known as metaphosphoric (HPO_3 , or $\text{H}_2\text{O.P}_2\text{O}_5$), pyrophosphoric ($\text{H}_4\text{P}_2\text{O}_7$, or $2\text{H}_2\text{O.P}_2\text{O}_5$), and orthophosphoric (H_3PO_4 , or $3\text{H}_2\text{O.P}_2\text{O}_5$) but described by the generic name of

phosphoric acid. Metaphosphoric acid and its salts differ from orthophosphoric acid and the orthophosphates by the want of one or two atoms of water or base. Accordingly, they are convertible into each other by loss or gain of one or two atoms of water or base, as by boiling, the meta- is converted into the orthophosphoric. Pyrophosphoric, heated to dull redness, is converted into metaphosphoric acid, and by the absorption of water the meta- passes into the orthophosphoric. The metaphosphates are remarkable for exhibiting very different properties according to the manner in which they are prepared, and form five classes of salts. Pyrophosphoric acid is capable of forming four classes of salts. The orthophosphoric acid is tribasic, forming three distinct classes of metallic salts; one, two, or three of its element, H, being capable of replacement by a base; thus the sodic orthophosphates are NaH_2PO_4 , Na_2HPO_4 , and Na_3PO_4 . The three atoms of H in phosphoric acid may be replaced in like manner by alcohol-radicles forming acid and neutral ethers. The salts of pyrophosphoric acid may be viewed as compounds of one atom of orthophosphate and one atom of metaphosphate, thus, $\text{M}_4\text{P}_2\text{O}_7 = \text{M}_3\text{PO}_4 + \text{MPO}_3$.

Phosphorous Acid occurs both as an anhydride, P_2O_3 , and as a hydrate, PH_3O_3 . *Hypophosphorous Acid*, PH_3O_2 , is only known in its hydrated condition, in which it occurs as a very acid, colourless, uncrystallisable syrup.

Phosphorus combines with hydrogen in three proportions to form phosphuretted hydrogen or phosphamine, PH_3 ; liquid phosphide of hydrogen, PH_2 ; and solid phosphide of hydrogen, P_2H . Of these, the first alone requires notice in these pages. There are various processes for obtaining the gas; one of the simplest being by boiling fragments of phosphorus in a solution of lime water, in which case, hypophosphite of calcium is formed, while phosphuretted hydrogen gas is extricated. The reaction is explained by the equation, $3\text{CaHO} + \text{P}_4 + 3\text{H}_2\text{O} = 3\text{CaH}_2\text{PO}_2 + \text{PH}_3$. The gas thus evolved is colourless, possesses a characteristic fetid odour, and has the remarkable property of taking fire spontaneously in atmospheric air or in oxygen gas, and of resolving itself into anhydrous phosphoric acid and water—a phenomenon of which Professor Miller has given the following graphic description: 'If allowed to escape into the air in bubbles, each bubble as it breaks produces a beautiful white wreath of phosphoric acid, composed of a number of ringlets revolving in vertical planes around the axis of the wreath itself as it ascends; thus tracing before the eye, with admirable distinctness, the rapid gyratory movements communicated to the superincumbent air by the bursting of a bubble upon the surface of a still sheet of water. If the bubbles be allowed to rise into a jar of oxygen, a brilliant flash of light, attended with a slight concussion, accompanies the bursting of each bubble.' There is reason to believe that *perfectly pure* phosphuretted hydrogen gas does not possess the power of igniting spontaneously, and that the self-lighting gas always contains a minute quantity of the vapour of the liquid phosphide (PH_2). The luminous phenomenon known as *Will-o'-the-Wisp* has been referred to the natural evolution of the gas; there is, however, no scientific evidence in favour of this hypothesis.

Various compounds of phosphorus with sulphur, chlorine, iodine, bromine, &c., have been formed and investigated; but none of them are of any practical importance.

The medicinal uses of *phosphorus* and *phosphoric acid* have still to be considered. Phosphorus, dissolved in ether or oil, was formerly prescribed in very minute doses as a stimulant to the nervous system in certain conditions. It is, however, now rarely employed in medicine, in consequence of its poisonous properties. Several cases are on record in which

children have been killed by sucking the phosphoric ends of lucifer-matches. Its fumes have caused necrosis of the lower jaw in those engaged in the manufacture of lucifer-matches. Christison relates an instance in which a grain and a half of phosphorus proved fatal.

The symptoms induced by this poison are those of acute inflammation of the stomach and bowels, and the only treatment that can be recommended is the administration of large quantities of mild demulcent fluids, such as milk and thin arrowroot, so as, if possible, to envelop the phosphorus, and exclude it from the action of the air in the intestinal canal; and of magnesia, with the view of neutralising any phosphorous and phosphoric acids that may be formed.

Dilute Phosphoric Acid is included in the British Pharmacopœia, but is not very much employed. It may be prescribed in much the same cases as those in which sulphuric and nitric acids are employed, and is less likely to disturb the digestive functions, if employed for a long period, than the other mineral acids. The late Dr Paris used to recommend it, when properly diluted, as the best acidulated drink for assuaging the thirst in diabetes. It may be prescribed in half-drachm doses.

PHOTIUS, Patriarch of Constantinople in one of the most critical periods of the struggle of that see with the great patriarchate of the West for supremacy in the entire church, was a member of a patrician family of Constantinople, and was born in the early part of the 9th century. From youth, he was distinguished by his abilities and learning; and having served in various important public offices, and especially on a diplomatic mission to Assyria (or more probably Persia), he secured the favour of the Emperor Michael, with whom P.'s brother was connected by marriage, and of the all-powerful Cæsar and favourite Bardas. The Patriarch Ignatius having incurred the displeasure of Bardas and of the emperor, a weak and profligate man, whose vices Ignatius tried in vain to correct, it was resolved to deprive him of the patriarchal dignity; and the attempt to induce him to resign having failed, he was deposed with much indignity, imprisoned, and sent into exile. P., although a layman, and hitherto engaged in secular pursuits, was appointed in his stead, hurried in a few successive days through all the stages of sacred orders, and finally installed as patriarch. A council of bishops, under the influence of the court (858), declared in favour of the deposition of Ignatius, and confirmed the election of P., and the latter communicated his election to the pope, Nicholas I., in a letter which carefully suppressed all these irregularities, and represented that he had reluctantly undertaken the office. Meanwhile, however, Ignatius had privately written to Rome, and the pope sent two legates to inquire and report on the facts. A new council was assembled (859), in which Ignatius was declared deposed, and was compelled to sign the act of abdication, and P. was declared duly elected. The legates concurred, it was believed, under the undue influence of Bardas, in this sentence. But in so doing they had exceeded their power, which was merely to report to the pope; and Nicholas refused to acknowledge the sentence, and summoned the parties to a new hearing. P., however, resisted; and a new cause of dispute having arisen in regard to the jurisdiction claimed by the see of Constantinople in part of the province of Illyricum and among the newly-converted Bulgarians, the council, which Nicholas called at Rome in 862, annulled the acts of that of Constantinople and of the legates, declared P.'s election uncanonical and invalid, deposed and excommunicated him, and

reinstated Ignatius in his see. Being supported, however, by the emperor, P. retained possession, and not only refused to yield, but retaliated on the pope by assembling a council at Constantinople in 867, in which the question was removed from the region of a personal dispute between the bishops to a controversy of doctrine and discipline between the churches of the East and West themselves. In this council, P. first brought forward distinctly certain grounds of difference between the churches, which, although considerably modified, afterwards led to their final separation. In all these doctrinal differences, the council condemned the Western Church, excommunicated Nicholas and his abettors, and withdrew from the communion of the see of Rome. During the life of the Emperor Michael, the authority of P. remained without further question; but on Michael being deposed and put to death by Basilus the Macedonian in 867, P., by that capricious exercise of imperial authority of which these times supply so many examples, was deposed, and banished to Cyprus, and Ignatius reinstated; soon after which, in 869, the council known as the eighth general council, at which Pope Adrian II.'s legates presided, was assembled at Constantinople. The whole case was revised. P. being convicted of fraud, forgery of documents, and uncanonical usurpation, was condemned and excommunicated, the rights of Ignatius established, and the intercommunion of the churches restored. From his exile at Cyprus, P. appealing successfully to Basilus, obtained his recall, and, on the death of Ignatius, was re-appointed to the patriarchate. The pope of the time, John VIII., yielding to expediency, or deceived by false reports, acquiesced in the proceeding—a supposed act of womanish weakness, which, in the opinion of some, by obtaining for John the feminine sobriquet *Joanna*, was the origin of the fable of POPE JOAN (q. v.). P., in 879, assembled a new council at Constantinople, renewed the charge against the Western Church, and erased from the creed in the article on the PROCESSION OF THE HOLY GHOST (q. v.), the word *filioque*, which had been inserted by the Latin Church. The separation of the churches, however, was not completed till the time of Michael Cerularius. See GREEK CHURCH. P. did not die in possession of the see; he was deprived, and exiled to Armenia, by Leo, surnamed the Philosopher, the son and successor of Basilus, in 886, and died soon afterwards, probably in 891. The character of P. is, of course, differently represented by the Easterns and by the Westerns, the latter of whom ascribe to him every excess of craft, violence, and perfidy. The Greeks, on the contrary, defend his memory. It is hardly possible, however, to doubt the substantial justice of the accusations made against him. The impression produced by a review of his chequered career, and of the more than equivocal proceedings with which his name is connected, is made more painful by the evidences of rare genius, and profound and cultivated literary judgment, which his works reveal. His chief remains are (1.) *Myriobiblon*, called also *Bibliotheca*, a summary review of the works which P. had read, with an epitome of the contents, and a critical judgment of their merits. The number of works thus criticised is no less than 279; and as many of these are now lost, the judgment and remarks of such a man are of great value for ancient literary history. (2.) A *Lexicon*, which was edited by Hermann, and afterwards by Porson (or rather from his manuscript by Dobree) in 1822. (3.) The *Nomocanon*, which is a collection of the acts and decrees of the councils up to the seventh ecumenical council, and the ecclesiastical laws of the emperors for the same period. (4.) Several minor theological treatises

(5.) A collection of letters, many of them extremely interesting and elegant. There is one in which, from his exile, he appeals to be permitted the use of his books, which, for beauty of composition, delicacy of sentiment, and the genuine eloquence of a scholar's love of learning, can hardly be surpassed in ancient or modern literature. A complete edition of his works is found in Migne's *Patrologia Cursus Completus*, in 4 vols., royal 8vo.

PHOTO-GLYPHIC ENGRAVING. See PHOTOGRAPHIC ENGRAVING, PHOTOGRAPHY.

PHOTOGRAPHIC ENGRAVING. Several ingenious attempts have been made to prepare engraved plates by photogenic action; the earliest of these dates as far back as 1827, which was six years previous to the introduction of the Daguerreotype process, and was the invention of M. Nicéphore Niepce of Paris, who first discovered that thin plates of bitumen were curiously affected by light; he therefore coated metal plates with a thin layer of bitumen, of the kind called Jews' Pitch, and placed them in a camera obscura, so arranged that he could insure their exposure to the same image for several hours. The plate was then submitted to the action of oil of spike, which readily dissolved those portions not acted upon by the light, but exerted little action upon the remainder; the metal exposed by the solution of the bitumen was then acted upon by acid, which produced a complete etching-plate, the picture-part being protected by its bituminous varnish from the action of the acid. About ten years after, M. Fizeau invented another process; he took a Daguerreotype picture, and acted upon it with a mixture of nitric, nitrous, and hydrochloric acids, which, without affecting the silver where the metal was free from the photographic action, quickly attacked the dark portions of the picture in greater or less degree according to their intensity, and thus etched the picture in the plate. This effect was increased by other operations, not now of sufficient importance to be described, since the entire method has been abandoned for the more satisfactory inventions of Dr W. H. Fox Talbot; these were patented in 1852 (No. 179) and 1858 (No. 875). By his first plan, a steel plate, such as is prepared for engravers, is first dipped into a solution containing acetic and sulphuric acids; it is then coated with a mixture containing a solution of fine gelatine and bichromate of potash. This is impressed with the image of a photographic negative by exposure in the copying frame, and washed. The film of gelatine is previously yellow, but the action of the light through the light parts of the photograph change it dark-brown, while the remainder is unaffected: consequently, a picture is produced of a light-yellow colour on a brown ground. The action of the light is to reduce the bichromate of potash, and, consequently, to render the gelatine combined with it insoluble; while those portions which have been protected from the action of the light by the dark parts of the negative, are still readily soluble in water, and can be removed by soaking: the insoluble portion thus forms a raised picture, which is submitted to a solution containing bichloride of platinum in certain proportions, with a little free acid and water, which etches out the exposed parts of the plate, and renders it fit for engraving from. In the same specification is added an ingenious method of giving to the whole picture the appearance of an engraving; it consists in spreading over the gelatinised plate, when nearly dry, a piece of very fine muslin, and evenly pressing it so as to leave an impression of the cross-lines of the textile material upon the surface. By his second specification, he alters the process so far as the

washing is concerned, after obtaining the picture on the gelatinised plate, and thus obviates some injury to which it was thereby rendered liable. Instead of washing, the gelatinised surface is thinly but very evenly covered with finely-powdered copal or other resin, and the under-side of the plate exposed to sufficient heat to melt the resin, so as to form a thin varnish over the whole. The etching fluid is then poured on, and, notwithstanding the resin coating, it acts through to the metal, and eats in wherever the gelatine has not been rendered insoluble by the action of the bichromate of potash and the light. When sufficiently etched, it is washed in clean water, and the plate is freed from the resin and gelatine. Two modifications of this process are given in the Specification, to which the reader is referred for fuller particulars. Dr Talbot calls his process *Photo-glyphic Engraving*. The same processes, with some modifications, applied to zinc constitute *Photo-zincography*, and to stone *Photo-lithography* (q. v.), both of which are largely practised; and they have been brought to such extraordinary perfection, especially by Sir Henry James, Director of the Ordnance Survey in Great Britain, and by an eminent firm in Brussels—Messrs Simonau, Toovy & Co.—that quite a new era is opened in the art of engraving and printing.

These processes are particularly well adapted for copying maps and printed books, and Drs Bache and Pierce have turned them to a most profitable account in producing reductions of the large plans of the U. S. Coast Survey to the proper size of maps. Reductions of the maps of the English Ordnance Survey and copies of the Domesday Book and other important documents have been made by these processes. See PHOTOGRAPHY.

PHOTOGRAPHY (Gr. *phos*, light, and *grapho*, I write). From the following brief sketch of the history of this art, it will be apparent that its present advanced form has resulted from the combination of various discoveries in reference to the nature and properties of light made by investigators at different periods. The progress has been far more rapid than in most of the sciences which have been built up in a similar manner. Like other branches of chemistry, it owes its origin to the alchemists, who, in their fruitless researches after the Philosopher's Stone and *Elixir Vitæ*, produced a substance to which they gave the name of *Luna Cornea*, or Horn Silver, which was observed to blacken on exposure to light. This property of the substance constitutes the leading fact upon which the science of photography is based. More recently, the illustrious philosopher Scheele made experiments with the substance in question, with a view to determine the effects produced upon it by different rays in the solar spectrum. His words are these (published in 1777): 'Fix a glass prism at the window, and let the refracted sunbeams fall on the floor; in the coloured light put a paper strewed with *luna cornea*, and you will observe that the horn silver grows sooner black in the violet rays than in any of the other rays.' Still more recently, the names of Wedgwood and Davy (1802), and of Niepce and Daguerre from 1814 to 1839, occur as followers in the path indicated by Scheele and the earlier savans; and in the early months of the year 1864 the attention of the Photographic Society of London was occupied by the endeavour to establish the authenticity and true photographic character of some pictures found in the library of Matthew Boulton, and believed to be true sun-pictures by James Watt, the celebrated engineer; thus offering great probability that the mind which produced the wonders of steam-power, had also been engaged in the same investigations which have resulted in the present more extensive

development of photographic science. Most of the experiments alluded to may be said to have been based upon the fact, that the salt of silver, called by the ancients *luna cornea*, and by modern chemists nitrate of silver (otherwise lunar caustic, from its use in medicine), is highly sensitive to the influence of light.

There seems but little doubt that some of the acute-minded men who investigated the phenomena of the influence of light must have made use of the beautiful invention of Baptista Porta of Padua, known as the Camera Obscura (q. v.); for the pictures of natural objects formed on the inner surface of this instrument would readily suggest its use in combination with the *luna cornea*. The honour of having been the first to produce pictures by the action of light on a sensitive surface is now very generally conceded to Thomas Wedgwood, an account of whose researches was published in 1802 in the *Journal of the Royal Institution*, under the title: 'An Account of a Method of copying Paintings upon Glass, and of making Profiles by the Agency of Light upon Nitrate of Silver; with Observations by H. Davy.' In the experiments detailed in this communication, white paper and white leather were imbued with nitrate of silver, and exposed either in the camera obscura, or under the leaves of trees or wings of insects. The result was, that the shadows preserved the parts concealed by them white, while the other parts became speedily darkened. The misfortune was, that no attempts made either by Wedgwood or Davy to prevent the uncoloured portions from being acted on by light (or, as we now say, to fix the picture) were successful. This operation was not effected in a thoroughly efficient manner until Sir John Herschel suggested the employment of hyposulphite of soda for that purpose. Many other fixing agents had been previously used, as ammonia, iodide of potassium, chloride of sodium, and bromide of potassium, suggested by Mr Fox Talbot; none of these, however, were found equal to the salt proposed and successfully used by Sir John Herschel.

M. Niepce, of Châlons-on-the-Saône, was the first to enjoy the satisfaction of producing permanent pictures by the influence of solar radiations. This was accomplished in 1814, and the name chosen to designate his process was heliography—a name in some respects preferable to photography. It consisted in coating a piece of plated silver or glass with a varnish made by dissolving powdered asphaltum to saturation in oil of lavender, taking care that the drying and setting of this varnish be allowed to take place in the entire absence of light and moisture. The plate so prepared was then exposed in the camera obscura for a length of time, varying from four to six hours, according to the amount of light. A faint image only is at first visible, and this is afterwards developed and fixed by immersion in a mixture of oil of lavender and oil of white petroleum; the plate being finally washed with water, and dried.

Adopting date of publication as the best evidence of discovery, the next process offering itself for consideration is that for photogenic drawing, by Mr Henry Fox Talbot, communicated to the Royal Society on the 31st of January, 1839, just six months previous to the publication of Daguerre's process. It consisted in immersing carefully selected writing-paper in a weak solution of common salt, and drying it. After this, a dilute solution of nitrate of silver was spread over one side, and the paper was again dried at the fire. When dry, it was fit for use, the sensitiveness being much increased by alternate treatment with saline and argentine solutions. Paper thus prepared yielded impressions in an incredibly short time, and nothing could be more perfect than

the images it gave of leaves and flowers, the light passing through the leaves delineating every ramification of their nerves. Considerable improvement in point of sensibility was attained by Mr Talbot in the following year, 1840, by the employment of iodide of silver on paper, as a foundation, to be washed over with a mixture of aceto-nitrate and gallo-nitrate of silver, just previous to exposure in the camera. Paper so prepared was so sensitive that an exposure of less than a second to diffused light was enough to produce an impression. After exposure and development, the picture was washed, and fixed by immersion in a solution of bromide of potassium.

Niepce and Daguerre accidentally discovered that they were conducting experiments of a kindred character, and shortly afterwards entered into a partnership. The former, however, dying in July 1833, a new deed of partnership was signed between his son Isidore and M. Daguerre, which resulted in the publication, in July 1839, of the process known as the Daguerreotype. This was not done, however, until the French government had passed a bill, securing to M. Daguerre a pension of 6000 francs, and to M. Isidore Niepce, the son of the Niepce, a pension of 4000 francs, both for life, and one-half in reversion to their widows. This handsome conduct on the part of the French government was based upon the argument, that '*the invention did not admit of being secured by patent, since, as soon as published, all might avail themselves of its advantages; they, therefore, chose to enjoy the glory of endowing the world of science and of art with one of the most surprising discoveries that honour their native land.*'

The discovery of the Daguerreotype may be said to have arisen from the dissatisfaction entertained by Daguerre with the insensibility of the bituminous surfaces of Niepce, which induced him to turn his attention to the salts of silver as a means of producing a higher degree of sensitiveness. This he attained by exposing a highly polished plate of silver (attached, for greater strength, to a copper plate) to the vapour of iodine, by which pure iodine of silver was formed on the surface. The plate so prepared was exposed in the camera obscura for a length of time (20 minutes), which was then considered very short. No apparent effect was produced on the plate, the image being a latent one, arising from a minute molecular disturbance caused by the impact of the actinic rays. The latent image was afterwards developed by exposing the plate to the vapour of mercury; and it is this development of a latent image, reducing as it did the time of exposure from hours to minutes, which truly constituted a new era in the science of photography. It is further due to Daguerre to state, that, while his processes for the purpose were imperfect, he still succeeded in fixing his pictures, although it was reserved for Sir John Herschel to announce the great suitability of the hyposulphites for dissolving the haloid salts of silver. The sensibility of the silver plate was still further increased by Mr Goddard, who suggested, in 1839, the association of the vapour of bromine with that of iodine; while M. Claudet, in 1840, employed chlorine. It is a remarkable fact in connection with these discoveries, that the elder Niepce should, so early as 1820, have tried the treatment of silver plates with the vapours of sulphur and phosphorus.

But the progress of this interesting science received a very important impulse from a discovery, which at first scarcely appeared to have any connection therewith. In 1833, Braconnot gave, in the *Annales de Chimie*, an account of a new substance obtained by the action of nitric acid on

starch, sawdust, linen, and cotton-wool. He named this substance Xyloidine; it was very combustible, and burned almost without residue. In 1838, Pelouze, in the *Comptes Rendus*, suggested its application in artillery. He says, 'Plunge paper in nitric acid (specific gravity 1.500), leave it in for two or three minutes, and wash: a kind of parchment is obtained, impermeable to moisture, and extremely combustible.' Dumas, in 1843, proposed the name Nitramidine, and suggested its use for fireworks. At a meeting of the British Association held at Southampton in the year 1846, Herr Schönbein, an eminent Prussian chemist, read a paper on the preparation of explosive cotton, a substance obtained by acting on ordinary carded cotton by a mixture of strong nitric and sulphuric acids. This explosive cotton was afterwards found to be soluble in ether; and the solution so prepared was named collodion by its discoverer, Mr Maynard, who, in 1848, published in the *American Journal of Medical Science* the formula for its preparation. This ethereal solution having a certain proportion of alkaline iodides and iodide of silver added thereto constituted the collodion first employed by Mr Archer, who, although deserving the credit of having first arranged a practicable working process with collodion for its basis, without which photography could not have attained its present high position, says, in the second edition of his *Manual*, 'it is due to Legray to say that he was the first to publish an account of collodion as a photographic agent;' thus illustrating the candour with which Mr Archer admitted his claim to be considered the first to suggest its value in photography. Mr Fallon Horne and Mr Fry materially assisted Mr Archer in bringing his experiments to perfection. Although the announcement at the British Association in 1846, was to the effect that Schönbein had made cotton as explosive as gunpowder, no particulars were published. In April 1847, he obtained a patent; but in October 1846, Mr Thomas Taylor had published a similar method to that patented. By one of those singular freaks of fortune which sometimes occur, Daguerre succeeded in identifying his name with his process; but Mr Archer was not so fortunate as to give his name to the process which he invented. A reference to the article COLLODION will shew that (bearing in mind that glass perfectly cleaned forms the supporting medium) the sensitive surface is obtained by the conversion of the soluble iodides and bromides in the collodion film into iodide and bromide of silver by immersion in a solution of the nitrate of that base, and that it is exposed in the camera while still moist with adherent nitrate, the latent image so obtained being developed with a mixture of pyrogallie acid, acetic acid, and alcohol, fixed with hyposulphite of soda, and varnished.

In the Niepotype or albumen process, glass plates of proper thickness and quality, and perfectly clean, are coated with Albumen (q. v.), to which an alkaline iodide has been added. When perfectly dry, they are immersed in a solution of nitrate of silver, when an immediate decomposition takes place; iodide of silver being formed in the albumen film, and nitrate of potash or ammonia remaining in solution. The plate is then freely washed with water, dried, exposed, developed with gallic acid, and fixed with hyposulphite of soda.

A retrospective glance will shew the reader that four processes have now been passed in review; and on a little consideration, it will be seen that one principle pervades the whole—viz, the production of a latent image by the action of light on iodide and bromide of silver, its subsequent development by suitable means, and the final removal of the

unaltered portions of the sensitive film by a fixing agent.

Among these processes, that in which collodion is employed has achieved a well-merited distinction, and is now so generally employed as almost entirely to exclude the others. Various modifications of this process have been from time to time suggested to meet the exigencies of landscape photography. It has already been stated that the collodion film is exposed while still moist with adherent nitrate of silver solution; and this method is especially applicable to the taking of portraits, where it is desired to reduce the time of exposure to a minimum; but for landscape purposes it is by no means so imperatively necessary to curtail the time of exposure; and as the necessary apparatus and materials for sensitising and developing a wet plate are somewhat cumbersome for field-work, it was suggested by the Abbé Despratz to wash off the free nitrate from the surface, and allow the film to dry in the absence of light. A number of sensitive plates can be prepared by this method in anticipation of a journey. This is called the 'Dry Collodion Process.' A plate so prepared is much inferior in point of sensitiveness to a wet plate, and this arises as much from an altered molecular condition of the iodide of silver as from the absence of free nitrate of silver. The Abbé Despratz introduced resin into his collodion, with the view of keeping the pores open. The pictures obtained by his process were, however, difficult to develop without stains; and a variety of agents have since been used, both from the organic and inorganic kingdoms, to preserve the film in the same molecular condition when dry as when wet. Among these may be mentioned nitrate of magnesia, honey, oxymel, and a host of other materials, such as sugar, albumen, infusion of malt, and lastly tannin, which last preservative agent bids fair to supersede all others.

A late improvement in the preparation of the glass for a negative consists in giving it a thin coat of albumen on the side which is to receive the collodion. Glass so prepared will hold the collodion film secure against all liability to peel off.

The practice of photography in the present day is confined almost exclusively to the POSITIVE, the NEGATIVE, and the DRY COLLODION Processes. In the first, the object is to obtain in the camera a direct image, which is to be viewed by reflected light; and as it is desired that the pictures so produced should possess pure blacks and whites, an inorganic (nitric) acid is used in the bath, and the developer—protosulphate of iron—is also of inorganic origin, these being the conditions best calculated to produce a deposit of pure white metallic silver. In the second, however, an image possessing density to transmitted light is required; accordingly, an organic (acetic) acid is used both in the bath and developer; and in order still further to insure an efficient supply of organic matter to combine with the silver at the moment of its reduction, pyrogallie acid is sometimes exclusively used. The third or dry process is distinguished from the preceding modifications of the wet process by the complete removal of the adherent free nitrate of silver, the application of a preservative agent, and the necessity for adding nitrate of silver to the developer.

It will be desirable, before concluding this article, to refer to some of the various applications of photography which have been made since the principles of the science have been well understood; and the article SAND BLAST will contain an account of the further employment of photography put into operation while this volume is preparing for the press (June, 1871).

PHOTO-LITHOGRAPHY is the application of photography to drawing on stone. Many efforts have been made in this direction, and success has been achieved in the production of excellent line prints; but the representation of objects of nature, with their infinite

gradation of lights and shades, has not been successful with this class of processes. The method known as Osborne's is generally regarded as that nearest perfection, and is in great favour for map-printing, copying line engravings, and other work to which it is applicable. The following account is condensed from the description by the inventor, Mr. G. J. W. Osborne, of Australia:

Albumenised paper, coated with a mixture of bichromate of potash and gelatine, prepared and dried in the dark, is exposed to the light under a negative, then taken to a dark room and rolled with ordinary lithographic ink. The ink will adhere permanently only to those parts that have been affected by the light, and with a depth proportionate to the intensity of the light on the various parts. The sheet is then floated, paper side downwards, on scalding water. The unaltered gelatine is now easily removed, by light sponging, and with it comes off the superfluous ink. The paper is then dried, laid on a lithographic stone, and passed under a roller. The impression is thus transferred to the stone, which is now ready for treatment in the ordinary way.

PHOTO-XYLOGRAPHY, the application of photography to wood-engraving. One process, patented by Mr Newton, consisted, first, in rubbing into the wood block a varnish, composed of asphaltum, ether, and lamp-black, to saturate the pores. Collodion was then poured on as in the ordinary Collodion Process (q. v.). The surface was then sensitised, and exposed in the camera, the picture being developed in the usual way. But the desired success was not complete, for the thickness of the united film was found to interfere with the operations of the engraver, and the process, in consequence, did not receive general adoption.

W. Crookes, F.R.S., subsequently simplified the method of producing an impression on wood blocks, by rubbing them over with a mixture of oxalate of silver and water, and exposing under a negative. The advantage of this process was, that it did not require any treatment of the block for the purpose of fixing after exposure, as if kept from the *continued* action of light, the block would keep long enough for the engraver to work out the details with his tools. It is fair to assume, notwithstanding the ingenuity displayed in these processes, that some insuperable objection exists to both of them, since neither has been adopted to much extent.

PHOTO-MICROGRAPHY consists in the enlargement of microscopic objects, by means of the microscope, and the projection of the enlarged image on a sensitive collodion film. The manipulatory details are the same as in the Collodion Process (q. v.), only that, on account of the delicate nature of the markings to be rendered, it is necessary to employ a collodion yielding what is termed a structureless film. The principle upon which the enlargement is effected is that of the conjugate foci. This branch of microscopic and photographic science has proved a useful aid in the study of the sciences of Botany, Physiology, and Entomology, by delineating, with unerring accuracy, woody fibre, ducts, starch granules, muscular fibre, blood discs, nerve papillæ, &c. Among the numerous experimenters attracted by this interesting study, Dr Maddox is perhaps the only one who has attained to any renown; and by him, minute animalcula, all but invisible by unassisted vision, have been magnified to a superficial area of three square inches, in which the most delicate details have been faithfully preserved. By reversing the arrangement necessary for these enlargements of microscopic objects, it will be seen that minute photographs of engravings, or other objects, may be produced which would require a microscope for their inspection, and it has been suggested that in this way war despatches might be transmitted in the setting of a ring or a breast-pin; and this is really by

no means so difficult to accomplish as it may seem at first sight, since photographs no larger than a pin's head have been produced, including in that small space portraits of no less than 500 eminent men.

CELESTIAL PHOTOGRAPHY comprehends the application of photography to the automatic registration of celestial phenomena. The labourers in this field of research have been numerous both in Europe and America. By far the most successful results within the past few years have been achieved by Mr L. M. Rutherford, of New York. To him is due the merit of making the first telescope corrected for photographic purposes. Previous to his improvement no telescope was capable of bringing the actinic rays from celestial objects to a perfect focus; and, hence, accurate photography in this department was simply impossible. But, with the corrected telescope, the record of the stars has been carried from the fourth to the ninth magnitude; and the inventor has had the satisfaction of obtaining in one night many plates of the constellation of the Pleiades more rigidly accurate than the map of the same group upon which Bessel worked at intervals during thirteen years. All who are acquainted with the interest attaching to stellar movements will appreciate the immense advance thus made in practical astronomy. Henceforth such proof-sheets of position, furnished at various times by the stars themselves, can be laid together after the lapse of years and centuries, and the stars will tell their own story of what they have been doing in the intervals. The surface of the moon, with many of its delicate markings, has been faithfully portrayed by the same means, and, besides stereographic views, photographs of the moon are now to be obtained as large as 24 inches in diameter. The application of photography to solar observations has of late years received a great impulse. The periodical variations in the prevalence of solar spots, and the connection between these variations and those observed in terrestrial magnetism have operated to direct much attention to these phenomena; and, in some observatories, photographs of the sun's disc are made at regular and frequent intervals, thus accumulating results which cannot fail to be of great importance in the study of the sun's constitution and influences.

Great use is now made of photography during solar eclipses. No expedition for eclipse observations is now considered complete unless accompanied by a corps of photographers, for the perfect establishment, by means of accurately-timed negatives, of the instants and points of contact. By this means, also, interesting views have been made of the corona and the rose-coloured flames attending total eclipses of the sun.

PHOTO-GALVANOGRAPHY, a method of producing from a photograph an electrotype copper-plate in a state fit for printing. It was invented by Mr Paul Pretsch, of Vienna, and is dependent on the property which unaltered gelatine possesses of swelling up in water. The first operation consists in coating a glass with a solution of gelatine and bichromate of potash, and, when this is dry, exposing the same to light under a negative. In accordance with the above-named property of gelatine, it will be found, on applying water to the film, that the portion unacted on will swell up, while those parts upon which the actinic rays have exercised their full influence will remain unchanged by the water. From the image thus obtained, a gutta-percha mould is prepared, and its surface made conducting by means of levigated graphite or bronze-powder. Copper is then deposited thereon by the electrolyte process, and the plate thus produced is printed from in the ordinary way.

PHOTO-GLYPHOGRAPHY is a process, invented by Mr Fox Talbot, for etching a photograph into a steel plate. It consists in coating the plate with a mixture of bichromate of potash and gelatine, and exposing

under a negative. The effect of this treatment is to render the gelatine insoluble, just in proportion to the intensity of the light's action, after which a solution of perchloride of iron, of a certain definite strength, is poured over the film, which solution penetrates those parts unacted on by light, reaching the steel plate, and biting itself in, but is repelled by that portion of the gelatine rendered insoluble; the plate being thus protected from the action of the solvent.

PHOTO-RELIEF PRINTING.—In 1865, Mr Walter B. Woodbury, of London, published a process which differs essentially from all the foregoing methods, and has accomplished better results in the production of pictures from nature. The printing-plate is not prepared by etching, but by mechanical pressure from a mould, the formation of which is thus described: A thin, dry sheet of bichromatised gelatine is exposed under the negative to the action of light. After the gelatine has thus been changed, as described in several preceding articles, the sheet is washed to remove the soluble parts. The insoluble gelatine remains in the form of a 'relief.' When dry, this is placed upon a steel plate in a hydraulic press, a sheet of lead is laid upon it, and the two are brought together by a pressure of about four hundred tons. The mould thus formed by the pressure of the relief into the lead is laid flat on another press, and upon the centre of it is poured, in a little pool, a warm solution of gelatine darkened with pigment of any desired colour. The paper is laid upon the solution, the press is brought down, and the mixture oozes outwards in all directions, fills the hollows in the mould, and attaches itself to the paper. In a few moments the proof is removed from the mould, immersed in an alum solution which renders it insoluble even in boiling water, then dried and flattened, and the work is done. It is difficult to conceive that anything in the shape of a print can ever surpass some of these pictures in the exquisite modulation of all the parts, including the difficult gradation of the middle tints. But we may look for improvement in facility and cheapness of production in small as well as in large quantities. This may or may not be possible by Woodbury's process; but everything is to be hoped from the inventive genius of many who are now pushing forward in this direction of art.

The reader is referred, for extended information, to Dr Hermann Vogel's (of Berlin) *Handbook of the Practice and Art of Photography*, Philada., 1871; *The Photographic News*, Lond., and the *Philada. Photographer*.

PHOTO-METER (Gr. *phōs*, light; *metron*, measure), an instrument for measuring the intensity of light. The first who occupied himself in scientifically determining the intensity of light was Bouguer; but his investigations were far surpassed by those of Lambert, about 1760. The latter indicated an exceedingly simple and effective kind of photometer, which was afterwards constructed by Rumford. The instrument consists of a screen of thin paper placed vertically, and behind it, at the distance of a few inches, is placed a cylindrical stick, or any other similar body. When the intensity of light from two flames is to be compared, they are placed behind this stick in such a way that each casts a separate shadow of the stick upon the paper screen. The observer stands in front of the screen, and directs the removal of the two lights either to or from the stick, till the shadows which are cast upon the screen are equally obscure. The distance of each light from the shadow it casts on the screen is then measured; and the squares of these distances give the relative intensities of the two lights. This photometer may also be modified by employing, instead of a cylindrical stick, a second screen parallel to the first, but of greater thickness, and having an aperture cut in its centre. The two lights being then placed behind the second screen,

and considerably apart, each casts a separate illumination through the aperture in the second upon the first screen, and the observer in front of the latter changes their relative distances till the illuminations appear to the eye of equal intensity. The calculation is the same as before. There are several other classes of photometers, which, however, do not deserve the name, as they depend upon the heating and chemical powers which generally accompany light, and not upon the intensity of its action on the organs of vision. Thus, Leslie's instrument is nothing more than a differential thermometer, while Saussure's and Landriani's depend upon the chemical effects of light. Lampadius, instead of calculating the intensities from the different distances of the lights from the screen, used plates of horn, or other semi-opaque material, of various thicknesses, and deduced his results from the comparative thickness of the two plates. The results attained by the aid of the photometer, owing to the imperfection of the instrument, are to be relied upon only within certain limits. Some of them are as follows: The light of the sun is 94,500 times greater than that of the moon; and an ordinary Argand lamp, with cylindrical wick, is equal to nine newly-trimmed candles.

PHOTO-SCULPTURE, a new art, invented, in the year 1865, by M. Willeme, a Frenchman. It has been introduced into Great Britain, and is successfully practised by M. Claudet in London, and a society has been formed for carrying it out in Paris. It consists in taking likenesses in the form of statuettes and medallions by the aid of photography, and a very ingenious series of accessory contrivances. A building specially adapted for the purpose is absolutely necessary; this consists of a circular room, 40 feet in diameter, and surmounted by a glass cupola 22 feet high, the supporting wall being about 8 feet in height, and pierced with 24 equidistant holes about 4 feet from the floor; these are only sufficiently large to permit the action of an ordinary camera lens through each one. Outside the surrounding wall of this circular chamber is a covered dark passage, in which twenty-four cameras are placed with their lenses adjusted

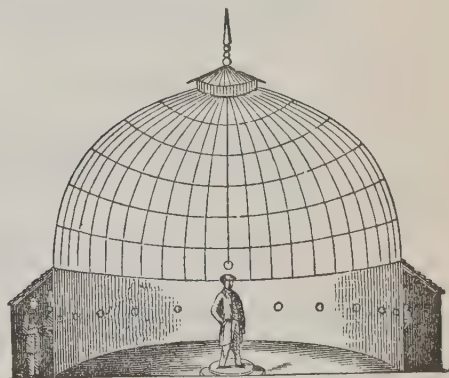

Fig. 1.

to the holes in the wall. The person whose likeness is to be taken stands in the centre under the glass dome, and at a given signal the cameras are simultaneously brought into action, and a photograph is taken. The whole of this arrangement will be fully understood by reference to fig. 1.

The twenty-four photographs are carefully numbered, so that no error can take place in the

subsequent operation, which is performed in another chamber: any room which can be darkened will do. It consists in placing them in consecutive order on a

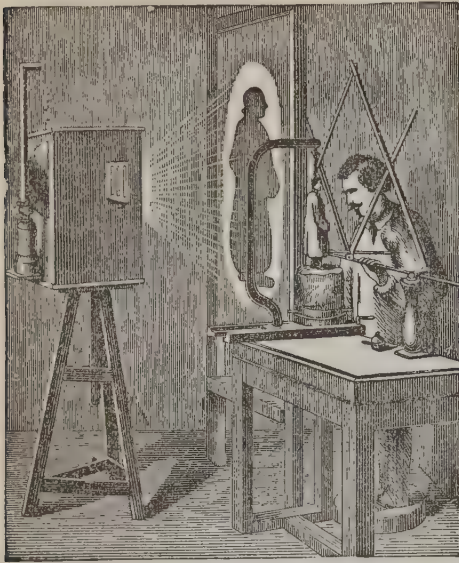

Fig. 2.

vertical wheel, which is so arranged that at the will of the operator each one can be brought before the lens of a magic lantern, and its image projected on a

transparent screen, as in fig. 2. The modelling clay is so placed, rather behind the screen, that the artist can use a pantograph, which has its reducing point armed with a moulding or cutting tool instead of a mere marker; and as the longer arm of the instrument describes the outline of the projected figures obtained from the photographs, the shorter one is reproducing on a smaller scale the figure in the clay. The statuette thus produced requires retouching with the hand to remove the sharp and rugged lines of the cutting-tools, and of course much depends upon artistic skill in doing this. In the skilled hands which have yet had to do with its operations, the arrangement has had so marked a success as to promise to produce in time the most satisfactory results.

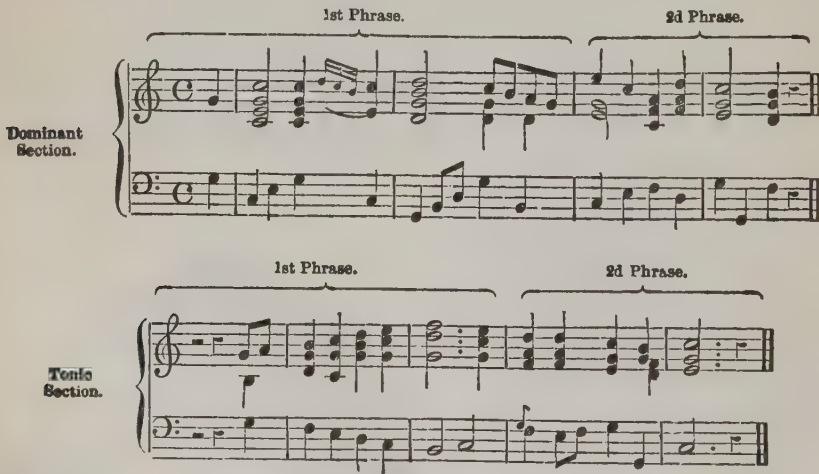

PHOTO-ZINCOGRAPHY. See **PHOTOGRAPHIC ENGRAVING.**

PHRAGMITES. See **REED.**

PHRASE, the name given, in Music, to the simple motives containing in themselves no satisfactory musical idea, which enter into the composition of every melody containing a perfect musical

idea, e. g.,  The phrase

most usually consists of two measures; in compound time, it may be comprised in one measure, and an extended phrase is one which contains three measures. In the more simple and regular forms of musical composition, two phrases unite to form a section ending in a cadence; and a perfect musical idea is formed of two such sections terminating, the first with the dominant, the second with the tonic harmony.

A little confusion has arisen from the use, by some musical writers, of the word phrase for what is here called a section.

PHRENITIS. See **MENINGITIS.**

PHRENOLOGY is a Greek compound signifying a discourse on the mind, but is used in a more limited sense to mean a theory of mental philosophy founded on the observation and discovery of the functions of the brain, in so far as it is concerned in intellectual and emotional phenomena. Phrenology takes into view likewise the influence of all other parts of the body, and of external agents affecting these, upon the brain.

The founder of this system was Dr Franz Joseph Gall (q. v.), who died in 1828. In Britain, it has been amply expounded by his pupil Dr Spurzheim (q. v.), by George and Andrew Combe (q. v.), by Dr Elliotson of London, and others. In America, Dr Charles Caldwell has been its ablest advocate. Gall's method of investigating the functions of the brain is that which, applied to other organs, has led to the discovery of their functions, but which had never before been systematically applied to the brain. When a physiologist wished to ascertain the function of any part of the body, he did not rest satisfied with examining its structure, and speculating on the purposes for which that structure seemed to be

adapted. He observed what kind of function appeared during life as the invariable accompaniment of the presence and action of that particular part; and, by repeated and careful observation, he at last succeeded in discovering the function. The knowledge thus obtained was afterwards verified and completed by examination of the structure, and observation of the effects of its injury or diseases. To the adoption of this principle in studying the functions of the brain, Gall was led by observing at school the concomitance of a quick and retentive memory of words with a peculiar appearance of the eye, which he afterwards found to be caused by a large development of a particular part of the brain. At school, at college, and in many other places, and under the most different circumstances, the same concomitance of talent with development of brain came under his notice so frequently, as to suggest to him the probability that there might be discovered by the same method a connection of other talents and dispositions with other portions of the brain. It was by the diligent application of the method of inquiry which accident had thus suggested to him, and not, as some suppose, by the exercise of his imagination, that Dr Gall was at last led to conclude, first, that the brain is an aggregate of many different parts, each serving for the manifestation of a particular mental faculty; and, secondly, that, *all other conditions being equal*, the size of each of these cerebral organs is a measure of the power of its function. These two propositions constitute the distinctive or fundamental principles of Phrenology. The first of them, however, is not new. The impossibility of reconciling actual phenomena with the notion of a single organ of the mind has, for many centuries, suggested the probability of a plurality of organs in the brain. But the phrenologists hold that Dr Gall was the first to *demonstrate* the fact, and to make any considerable progress in determining with what parts of the brain the various intellectual and emotional faculties and susceptibilities are connected.

That man, in his present state, cannot think, will, or feel without the intervention of the brain, is generally admitted by physiologists, and appears from even the fact that, by pressure applied to it, consciousness is at once suspended. That it is not a single organ is *a priori* probable from such considerations as these: 1. It is a law in physiology that different functions are never performed by the same organ. The stomach, liver, heart, eyes, ears, have each a separate duty. Different nerves are necessary to motion and feeling, and there is no example of confusion amongst them. 2. The mental powers do not all come at once, as they would were the brain one organ. They appear successively, and the brain undergoes a corresponding change. 3. Genius varies in different individuals: one has a *turn*, as it is called, for one thing, and another for something different. 4. Dreaming is explained by the doctrine of distinct organs which can act or rest alone. 5. Partial insanity, or madness on one point with sanity on every other, similarly points to a plurality of cerebral organs. 6. Partial injuries of the brain, affecting the mental manifestations of the injured parts, but leaving the other faculties sound, tend to the same conclusion. 7. There could be no such state of mind as the familiar one where our feelings contend with each other, if the brain were one organ.

These are grounds for presuming that the brain is not single but a *cluster of organs*, or at least that it is capable of acting in parts as well as in whole. For this conclusion the phrenologists consider that they have found satisfactory proofs in numerous observations, shewing that particular manifestations

of mind are proportioned, in intensity and frequency of recurrence, to the size or expansion of particular parts of the brain—this law being subject to modification in the case of the brain, as in that of the muscles and other parts of the body, by differences of health, quality, exercise, &c.

If size of organ, *ceteris paribus*, is the measure of the vigour of function, it is of great moment in what region of the brain the organs are largest—whether in the animal, moral, or intellectual. On this preponderance depends the character. Two brains may be exactly alike in size generally, yet the characters may be perfect contrasts to each other.

It is held by phrenologists—1. That by accurate observation of human actions, it is possible to discover the strength of the dispositions and intellectual powers of men; 2. That the form of the brain can, in normal subjects not beyond middle age, be ascertained with sufficient accuracy from the external form of the head—the brain, though the softer substance, being what determines the shape of the skull; 3. That the organs or parts of which the brain is composed appear on its surface in folds or convolutions, which have a well-ascertained fibrous connection with the *medulla oblongata*, which unites the brain to the spinal cord; 4. That the brain being divided into two equal parts called *hemispheres*, in each of which the same organ occurs, all the organs are double, like the ears and eyes. See BRAIN. But when the term *organ* is used, both organs are meant.

It is true that where strength is most needful, the skull is thicker than at other places; but this is not overlooked by phrenologists, nor do they fail to warn observers against mistaking for signs of cerebral development the bony processes and ridges which serve for the attachment of muscles to the skull. See SKULL. They recognise also, as we shall see, the uncertainty often occasioned by the frontal sinus.

Besides the brain proper, there is a smaller brain, lying below the hinder part of the main brain, and called the *cerebellum*.

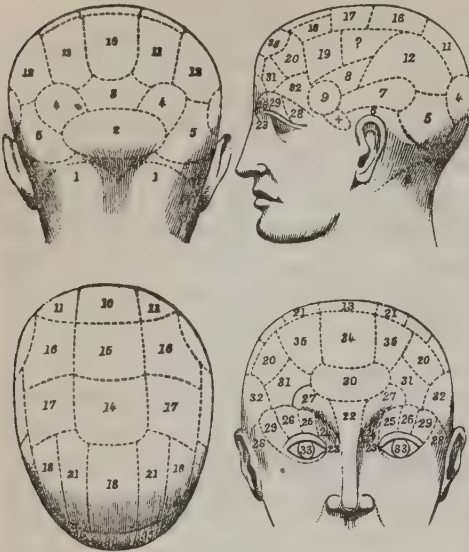

The brain is divided into the *anterior, middle, and posterior lobes*. The anterior lobe contains the organs of the intellectual faculties; the posterior lobe and lower range of the middle one are the regions of the animal propensities; while the moral sentiments are stated to have their organs developed on the top or coronal region of the head.

Phrenologists distinguish between *power* and *activity* in the mental faculties. Power, in whatever degree possessed, is *capability* of feeling, perceiving, or thinking; while activity is readiness and quickness in the exercise of power.

The powers of mind, as manifested by the organs, are called *faculties*. A faculty may be defined to be a particular power of thinking or feeling. A faculty is regarded as elementary or primary—1. When it exists in one kind of animal, and not in another; 2. When it varies in the two sexes of the same species; 3. When it is not in proportion to the other faculties of the same individual; 4. When it appears earlier or later in life than the other faculties; 5. When it may act or repose singly; 6. When it is propagated from parent to child; and 7. When it may singly preserve its soundness, or singly become deranged or extinct.

The faculties are usually divided by phrenologists into two orders—FEELINGS and INTELLECT, or AFFECTIVE and INTELLECTUAL FACULTIES. The Feelings are divided into two genera—the *Propensities* and the *Sentiments*; while the Intellectual embrace the *Perceptive* or *Knowing*, and the *Reflective Faculties*. This classification, however, is avowedly imperfect.

The following is a representation of the human head in four points of view, shewing the positions of the cerebral organs, according to Mr Combe :

AFFECTIVE.

I.—PROPRITIES.

1. Amativeness.
2. Philoprogenitiveness.
3. Inhabitiveness or Concentrativeness.
4. Adhesiveness.
5. Combaticiveness.
6. Destructiveness. [Alimentiveness.] [Love of Life.]
7. Secretiveness.
8. Acquisitiveness.
9. Constructiveness.

II.—SENTIMENTS.

10. Self-esteem.
11. Love of Approbation.
12. Cautiousness.
13. Benevolence.
14. Veneration.
15. Firmness.
16. Conscientiousness.
17. Hope.
18. Wonder.
19. Ideality.
20. Wit, or Ludicrousness.
21. Imitation.

INTELLECTUAL.

I.—PERCEPTIVE.

22. Individuality.
23. Form.
24. Size.
25. Weight.
26. Colouring.
27. Locality.
28. Number.

29. Order.
30. Eventuality.
31. Time.
32. Tune.
33. Language.

II.—REFLECTIVE.

34. Comparison.
35. Causality.

1. *Amativeness*, or sexual love, is believed to have for its organ the cerebellum, or at least a portion of it. As the basis of domestic life, this faculty is of great importance, and its regulation has ever been one of the prime objects of moralists and legislators.

2. *Philoprogenitiveness*, or love of offspring, is generally strongest in the female. Its organ is one of the easiest to distinguish in the human head. Those who are flat and perpendicular there, instead of being delighted, are annoyed by children. The feeling is said to give a tender sympathy with weakness and helplessness in general. The most savage races must have affection for their young, or they would become extinct. The organ, like the other cerebral parts, may become diseased; and insanity on the subject of children often occurs.

3. *Inhabitiveness* (called by Mr Combe *Concentrativeness*) has its organ immediately above the preceding. Dr Gall did not discover its function; and Dr Spurzheim, observing it large in persons attached to their native place, or any place in which they had long dwelt, called it *Inhabitiveness*. Mr Combe thought it has a more extended sphere

of action. He observed it large in those who can detain continuously their feelings and ideas in their minds; while the feelings and ideas of others pass away like the images in a mirror, so that they are incapable of taking systematic views of a subject, or concentrating their powers to bear on one point. The organ is stated as only probable, till further facts are obtained.

4. *Adhesiveness*.—The organ of this feeling was discovered by Gall, from being found very large in a lady remarkable for the warmth and steadiness of her friendships. It attaches men and gregarious animals to each other, and is the foundation of that pleasure which mankind feel in bestowing and receiving friendship, and in associating with each other. Acting with *Amativeness*, it gives constancy and duration to the attachment of the married. Generally speaking, *Adhesiveness* is strongest and its organ largest in woman.

5. *Combaticiveness*.—Dr Gall discovered the organ of this propensity by a vast number of observations on the heads of persons fond of fighting. Dr Spurzheim extended its function to *contention* in general, whether physical or moral. Those deficient in it shew that over-gentle and indolent character which yields to aggression, is easily repelled by the appearance of difficulty and trouble, and naturally seeks the shades and eddy-corners of life.

6. *Destructiveness*.—The propensity to destroy is abundantly manifested by man and carnivorous animals, and when too strong or ill-regulated is the source of cruelty and wanton mischief. As a defensive power, it is of high utility. Anger, resentment, and indignation spring from it. A small endowment is one of the elements of a 'soft' character; while persons who have much of it are generally marked by an energetic, and probably fierce and passionate character.

Alimentiveness and *Love of Life*.—Some of the recent phrenological works treat in this part of the order of the faculties, of a faculty of *Alimentiveness*, or the propensity to eat and drink, and also of another which follows—viz., *Love of Life*. The first being represented as no more than *probable*, and the second as only *conjectural*, they have no number allotted to them on the bust. The place assigned to *Alimentiveness* is marked by a cross on the side-view of the bust. Mr Combe suggests that the organ of the *Love of Life* is probably a convolution at the base of the middle lobe of the brain, the size of which cannot be ascertained during life.

7. *Secretiveness* is the propensity to conceal, which in excess assumes the form of cunning. It helps animals both to avoid and to prey upon each other. In abuse, it leads to lying, hypocrisy, and fraud, and with *Acquisitiveness* disposes to theft and swindling. The organ is subject to disease, and cunning madmen are difficult to deal with. Disease here often leads to belief in plots and conspiracies formed against the patient.

8. *Acquisitiveness*.—The existence of a cerebral organ for the desire of property is held by phrenologists to prove that this is not, as many have thought, a derived or secondary tendency. It is what Lord Kames calls the 'hoarding appetite.' This explains the miser's desire to accumulate money, without regard to its use in the purchase of other enjoyment. When the organ is diseased, persons in easy circumstances are sometimes prone to pilfer everything of value, and often of no value, which comes in their way.

9. *Constructiveness* is the impulse to fashion and construct by changing the forms of matter. Many of the inferior animals possess it, as the beaver, bee, and birds. Physical nature consists of raw

materials which Constructiveness prompts and enables man to adapt to his purposes.

10. *Self-esteem* is the source of that self-complacency which enhances the pleasures of life, gives the individual confidence in his own powers, and enables him to apply them to the best advantage. It is sometimes called proper pride, or self-respect, in which form it aids the moral sentiments in resisting temptations to meanness and vice. Its deficiency renders a man too humble, and the world take him at his word, and push him aside. Its excess produces arrogance, selfishness, disobedience, and tyranny. Self-esteem becomes insane perhaps more frequently than any other faculty, and then shews itself in extravagant notions of self-importance. Such maniacs fancy themselves kings, emperors, and even the Supreme Being. The organ is generally larger in men than in women; and more men are insane from pride than women.

11. *Love of Approbation* is the desire of the good opinion, admiration, and praise of others. It is an excellent guard upon morals as well as manners. The loss of character, to those largely endowed with it, is worse than death. If the moral sentiments be strong, the desire will be for honest fame; but in meaner characters, the love of glory is a passion that has deluged the world with blood in all ages. Shamelessness is the effect of its deficiency, often observed in criminals. The organ oftener becomes diseased in women than in men, as in women it is more active than in the other sex generally.

12. *Cautiousness*.—The organ of this faculty is found large in persons much troubled with fears, hesitations, and doubts. Its normal character is well expressed by its name. When diseased, as it often is, the organ produces causeless dread of evil, despondency, and often suicide.

13. *Benevolence* is the desire to increase the happiness and lessen the misery of others. When strong, it prompts to active, laborious, and continued exertions, and, unless Acquisitiveness be powerful, to liberal giving to promote its favourite object. Unregulated by Conscientiousness and Intellect, Benevolence degenerates into profusion and facility. It often coexists with Destructiveness in great force; as it did in Burns, whose poem on a Wounded Hare expresses both feelings highly excited.

14. *Veneration* has for its object *whoever and whatever is deemed venerable* by the individual. One man venerates what another treats with indifference, because his understanding leads him to consider that particular object as venerable, while his neighbour deems it otherwise. But any man with a large endowment of the organ will have a tendency to consider others as superior to himself. Veneration is the basis of loyalty, and, having the Deity for its highest object, forms an element in religious feeling. So liable is its organ to disease, that high devotional excitement is one of the most common forms of insanity.

15. *Firmness* is the source of fortitude, constancy, perseverance, and determination; when too powerful, it produces obstinacy, stubbornness, and infatuation. The want of it is a great defect in character. The English soldier is more persistent than the French, although in courage and spirit they are equal.

16. *Conscientiousness* gives the love of justice, but intellect is necessary to shew on which side justice lies. The judge must hear both sides before deciding, and his very wish to be just will prompt him to do so. Conscientiousness not only curbs our faculties, when too powerful, but stimulates those that are too weak, and incites us to duty even against strong inclinations. The existence of

Conscientiousness as an independent element in the human constitution, explains some apparent inconsistencies in human conduct—that a man, for instance, is kind, forgiving, even devout, and yet not just. The organ is commonly larger in Europeans than in Asiatics and Africans; very generally, it is deficient in the savage brain. When it is diseased, the insanity consists in morbid self-reproach, belief in imaginary debts, and the like.

17. *Hope* was regarded as a primary faculty by Spurzheim, but was never admitted by Gall, who considered it as a function of every faculty that *desires*. Dr Spurzheim answered, that we desire much of which we have no hope. It produces gaiety and cheerfulness, looks on the sunny side of everything, and paints the future with bright colours. When not well regulated, Hope leads to rash speculation, and, in combination with Acquisitiveness, to gambling, both at the gaming-table and in the counting-house. It tends to make the individual credulous of promised good, and often indolent.

18. *Wonder*.—Dr Gall found the organ of this faculty large in seers of visions and dreamers of dreams, and in those who love to dwell on the marvellous, and easily believe in it. Persons who have it powerful are fond of news, especially if striking and wonderful, and are always expressing astonishment; their reading is much in the region of the marvellous, tales of enchanters, ghosts, and witches. When the sentiment is excessive or diseased, it produces that peculiar fanaticism which attempts miracles, and (with Language active, speaks in unknown tongues.

19. *Ideality*.—The organ of this faculty was observed by Dr Gall to be prominent in the busts and portraits of deceased, and in the heads of a great number of living, poets. This confirmed to him the old classical adage, that the poet is born, not made. He called it the organ of Poetry. The name of Ideality was given to it by Dr Spurzheim. This faculty is said to delight in the perfect, the exquisite, the *beau-ideal*, the beautiful and sublime. The organ is usually small in criminals and other coarse and brutal characters, for it is essential to refinement. It prompts to elegance and ornament in dress and furniture, and gives a taste for poetry, painting, statuary, and architecture. A point of interrogation is placed on the bust on the back part of the region of this organ, conjectured to be a different organ, but one allied to Ideality. The existence of the faculty of Ideality is held by phrenologists to prove that the sentiment of beauty is an original emotion of the mind, and to settle the controversy on that subject. See *ÆSTHETICS*.

20. *Wit, or the Sentiment of the Ludicrous*.—The phrenological writers have discussed at great length, and with not a little controversy, the metaphysical nature or analysis of this faculty. We need not follow them into this inquiry, as most of them are agreed that by means of it we feel and enjoy the *ludicrous*.

21. *Imitation*.—Dr Gall found the prominence of this organ accompanied by instinctive, and often irrepressible mimicry. The tendency to imitate is evidently innate; from the earliest years, it makes the young follow the customs and the manner of speech of those around them, and so preserves a convenient uniformity in the manners and externals of society. Celebrated actors always possess it strong, and by its means imitate the supposed manner, and even feel the sentiments, of their characters. Its organ is found large also in painters and sculptors of eminence. In its morbid states, the impulse to mimic becomes irresistible.

We now come to the Intellectual Faculties, or

those which make us acquainted with things that exist, and with their qualities and relations. Dr Spurzheim divided them into three genera—1. The External Senses; 2. The Internal Senses, or Perceptive Faculties; 3. The Reflecting Faculties.

The external senses, as generally received, are five in number—*Touch, Taste, Smell, Hearing, and Sight*. There seem to be two more—namely, the *Sense of Hunger and Thirst*, and the *Muscular Sense*, or that by which we feel the state of our muscles as acted upon by force and resistance. Without this last sense, we could not keep our balance, or suit our movements to the laws of the mechanical world. Whether each sense has a special cerebral organ in addition to its external apparatus and nerves, is a question regarded by phrenologists as still undetermined.

22. *Individuality*, the first in the list of the perceptive faculties, is not easily defined. It is said to take cognizance of individual objects as such, e.g., a horse or a tree. Other knowing faculties perceive the form, colour, size, and weight of the horse, but Individuality is thought to unite all these and give the idea of a horse. It is regarded as the storehouse of knowledge of things simply existing. When it is strong, without being accompanied by reflecting power, the mind is full of facts, but unable to reason from them. After puberty, the size of the organ of Individuality, as well as of the neighbouring organs of Size, Weight, Colouring, and Locality—all situated behind the superciliary ridge of the skull—is often rendered doubtful by the existence of a hollow space, of uncertain width and extent, between the two plates of the skull. This hollow is called the *frontal sinus*; and when it is large, there may be a great projection of the bone over the eyes, without a corresponding projection of brain within. When this part of the skull is flat, however, the organs must be at least as defective as the flatness indicates. Owing to the source of uncertainty here pointed out, and the smallness of the organs behind the eyebrows, the functions of those parts of the brain are not regarded as being so well ascertained as those of the larger organs, nor will a cautious phrenologist be too ready to pronounce them large.

23. *Form*.—When the organ of Form is large, the eyes are wide asunder. Dr Gall discovered it in persons remarkable for recognising faces after long intervals, and although perhaps only once and briefly seen. The celebrated Cuvier owed much of his success in comparative anatomy to his large organ of Form. Decandolle mentions that 'his [Cuvier's] memory was particularly remarkable in what related to forms, considered in the widest sense of that word; the figure of an animal seen in reality or in drawing never left his mind, and served him as a point of comparison for all similar objects.'

24. *Size*.—Every object has size or dimension; hence a faculty seems necessary to cognize this quality. The supposed organ is situated at the inner extremities of the eyebrows, where they turn upon the nose. A perception of size (including distance) is important to our movements and actions, and essential to our safety.

25. *Weight*.—A power to perceive the different degrees of weight and force is likewise essential to man's movements, safety, and even existence. Phrenologists have generally localised the organ of that power in the part of the brain marked 25 on the bust.

26. *Colouring*.—The organ of this faculty is large in great painters, especially great colourists, and gives an arched appearance to the eyebrow; for example, in Rubens, Titian, Rembrandt, Salvator

Rosa, and Claude Lorraine. In cases of colour-blindness, it is found small. Many persons, though able to distinguish colours, have no perception of their harmonies: for this perception, a higher endowment of the faculty seems to be required.

27. *Locality*.—Dr Gall was led to the discovery of this faculty by comparing his own difficulties with a companion's facilities, in finding their way through the woods, where they had placed snares for birds, and marked nests, when studying natural history. Every material object must exist in some part of space, and that part of space becomes place in virtue of being so occupied. Objects themselves are cognized by Individuality; but their place, the direction where they lie, the way to them, fall within the sphere of Locality. Its organ is large in those who find their way easily, and vividly remember places in which they have been. It materially aids the traveller, and is supposed to give a love for travelling. The organ was large in Columbus, Cook, Park, Clarke, and other travellers.

28. *Number*.—The organ of this faculty is placed at the outer extremity of the eyebrows and angle of the eye. It occasions, when large, a fullness or breadth of that part of the head, and often pushes downwards the external corner of the eye. When it is small, the part is flat and narrow between the eye and the temple. Dr Gall called the faculty *le sens des rapports des nombres* (the Sense of the Relations of Numbers), and assigned to it not only arithmetic, but mathematics in general. Dr Spurzheim more correctly limits its functions to arithmetic, algebra, and logarithms; geometry being the products of other faculties, particularly Size and Locality. Dr Gall first observed the organ in a boy who could multiply and divide, mentally, ten or twelve by three figures, in less time than expert arithmeticians could with their pencils. Many such examples are on record.

29. *Order*.—The organ of this faculty is said to be large in those who are remarkable for love of method, neatness, arrangement, and symmetry, and are annoyed by confusion and irregularity. In savages, whose habits are slovenly, filthy, and disgusting, the organ is comparatively small.

30. *Eventuality*.—The organ is situated in the very centre of the forehead, and when large, gives to this part of the head a rounded prominence. Individuality has been called the faculty of *nouns*; Eventuality is the faculty of *verbs*. The first perceives merely things that exist; the other, motion, change, event, history. The most powerful knowing minds have a large endowment of both Individuality and Eventuality; and such persons, even with a moderate reflecting capability, are the clever men in society—the acute men of business—the ready practical lawyers. The organ of Eventuality is generally well developed in children, and their appetite for stories corresponds.

31. *Time*.—Some persons are called walking time-pieces; they can tell the hour without looking at a watch; and some even can do so, nearly, when waking in the night. The impulse to mark time is too common, too natural, and too strong, not to be the result of a faculty; it is an element in the love of dancing, almost universal in both savage and civilised man.

32. *Tune*.—The organ of Tune is large in great musicians; and when it is small, there is an utter incapacity to distinguish either melody or harmony. The great bulk of mankind possess it in a moderate endowment, so as to be capable of enjoying music in some degree. Those in whom it is large and active, become, in all stages of society, distinguished artists, exercising a peculiar power over their

fellow-creatures, so as to rouse, melt, soothe, and gratify them at pleasure. But the gift, in this active form, is liable to be much modified according as it is accompanied by Adhesiveness, Combativeness, Ideality, Benevolence, Wit, and other faculties.

33. *Language*.—The comparative facility with which different men clothe their thoughts in words, and learn to repeat them by heart, depends on the size of the organ of Language, which is situated on the supra-orbital plate, immediately over the eyeball, and, when large, pushes the eye outwards, and sometimes downwards; producing, in the latter case, a wrinkling or pursing of the lower eyelid. Verbal memory is strong or weak, without relation to the strength or weakness of the memory of things, forms, or numbers.

The Perceptive Organs are for the most part called into activity by external objects; but internal causes often excite them, and objects are then perceived which have no external existence, but which, nevertheless, the individual may believe to be real. This is the explanation of visions and ghosts, and of the fact that two persons never see the same spectres at the same time. Excess or disease in the organ of Wonder predisposes to belief in the marvellous and supernatural, and probably stimulates the Perceptive Organs into action, when spectral illusions are the consequence.

34. *Comparison*.—Dr Gall discovered the organ of this faculty in a man of science who reasoned chiefly by means of analogies and comparisons, and rarely by logical deductions. The middle of the upper part of his forehead was very prominent. The precise nature of the faculty has been much disputed among phrenologists, but they seem to agree that the perception of analogy depends upon it. Every faculty, we are told, can compare its own objects: Colouring can compare colours; Weight, weights; Form, forms; Tune, sounds; but Comparison can compare a colour with a note, or a form with a weight, &c. Analogy is a comparison not of things, but of their relations.

35. *Causality*.—This is regarded as the highest and noblest of the intellectual powers. Dr Spurzheim so named it from believing that it traces the connection between *cause* and *effect*, and recognises the relation of ideas to each other in respect of *necessary consequence*. Some metaphysicians have held that we have no idea of cause, but see only sequence, or one event following another. See CAUSE. It is true that we do see sequence; but we have a *third* idea—that of power, agency, or efficiency, existing in some way in the antecedent, to produce the consequent. Whence do we get this third idea?—from a distinct faculty, Causality. It is a large ingredient in wisdom.

The phrenologists have chiefly confined their attention to the organs of the brain, and the various faculties of which these are the instruments. The former writers on mind—Reid, Stewart, Brown, and others—gave, on the contrary, their chief care to the mental acts called Attention, Perception, Conception, &c., which they considered as faculties. The phrenologist does not overlook the importance of this department of mental philosophy, but differs from the metaphysicians in considering perception, conception, memory, &c., as only *modes* in which the real faculties above described act. This distinction is one of great importance.

According to the phrenologists, the faculties are not mere passive susceptibilities; they all tend to action. When duly active, the actions they produce are proper or necessary; in excess or abuse, they are improper, vicious, or criminal. Small moral organs do not produce abuses; but they are

unable to prevent the abuse of the animal organs, as larger tend to do; thus small Benevolence is not cruel, but it does not offer sufficient control to Destructiveness, which then impels to cruelty. *Ceteris paribus*, large organs have the greatest, and small the least tendency to act—each faculty producing the feeling or idea peculiar to itself. In active constitutions, the brain partakes of the general activity, and comes more readily into play than where the constitution or temperament is lymphatic. Health and disease, exercise and inaction, nutrition and starvation, have also great influence in modifying both the power of the cerebral organs and their readiness to act. Moreover, when certain faculties have been much exercised for a series of generations in a family, they are apt to be manifested in greater strength and activity than where no such hereditary influence exists. Seeing that all the organs tend to action, each, it is concluded, must have a legitimate sphere of action, and be necessary for the welfare of man.

The PROPENSITIES and SENTIMENTS cannot be called into action by the will. We cannot fear, or pity, or love, or be angry, by willing it. But internal causes may stimulate the organs, and then, whether we will or not, their emotions will be felt. Again, these feelings are called into action in spite of the will, by the presentation of their external objects—Cautiousness, by objects of terror; Love, by beauty; and so on. The excitability of the feelings, whether stimulated from within or without, is increased by activity of the temperament. Insanity is a frequent result of over-activity of the propensities and sentiments. These may be diseased and yet the intellect sound. The converse is also true. When an organ is small, its feeling cannot be adequately experienced. The will can *indirectly* excite the propensities and sentiments by setting the intellect to work to find externally, or conceive internally, the proper objects. Lastly, these faculties do not form ideas, but simply feel; and therefore have no memory, conception, or imagination.

The PERCEPTIVE and REFLECTING FACULTIES, or Intellect, form ideas, perceive relations, and are subject to, or rather constitute, the Will; and minister to the affective faculties. They may be excited by external objects and by internal causes. When excited by the presentation of external objects, these objects are *perceived*, and this act is called PERCEPTION. It is the lowest degree of activity of the intellectual faculties; and those who are deficient in a faculty cannot perceive its object. —CONCEPTION also is a mode of action of the faculties, not a faculty itself. It is the activity of the faculties from internal causes, either willed, or involuntary from natural activity. —IMAGINATION is Conception carried to a high pitch of vivacity. —MEMORY, too, is not a faculty, but a mode of action. There is no such thing as the *general* memory of the metaphysicians, but every intellectual faculty has its own memory. Memory differs from Conception and Imagination in this, that it recollects *real* objects or events which it has actually perceived, and adds the consciousness of time elapsed since they were perceived. The other named modes of action do not require realities or time. —JUDGMENT is, properly, the perception of adaptation, fitness, and necessary consequence; this is a mode of action of the reflecting powers. In a certain sense, the Perceptive Faculties may each be said to possess judgment; as Colouring judges of colours; Form, of forms; Tune, of music. By the word 'judgment,' however, is meant right reasoning, sound deciding. To this, a proper balance of the affective faculties is essential. There can be no sound judgment where any of the feelings are

excessive.—CONSCIOUSNESS is the knowledge which the mind has of its own existence and operations.—ATTENTION is not a faculty, but the application, or *tension*, of any or all of the intellectual faculties.—ASSOCIATION is the succession of ideas in the mind, each seeming to call up that which succeeds; so that in our waking-hours the mind is never without an idea passing through it. This is a state or condition of the faculties, not a faculty.—PASSION is any faculty in excess: Love is the passion of Amativeness in union with Adhesiveness and Veneration; Avarice, of Acquisitiveness; Rage, of Destructiveness.—PLEASURE and PAIN, JOY and GRIEF, also belong to each faculty, according as it is agreeably or disagreeably affected.—HABIT is the power of doing anything well, acquired by frequently doing it. But before it can be done at all, there must be the faculty to do it, however awkwardly.—TASTE was held by Mr Stewart to be a faculty, and to be acquired by habit. It seems to be the result of a harmonious action of all the faculties.

Such is an outline of the system propounded by the phrenologists. So far as it shall be confirmed by the mature experience and observation of competent inquirers, the facts and principles which it unfolds must be of great practical value to mankind. The study of the mutual influence of the mind and body has ever been recognised by wise and observant men as one of high importance, though of great difficulty; and certainly, Gall and his followers have not only given a strong impulse to that study, but have thrown much light on the diversities of human character, and accumulated a large body of facts of a kind which had previously been too much overlooked. Much, it is admitted, still remains to be discovered. 'No phrenologist,' says Mr Combe, 'pretends that Gall's discoveries are perfect; they are far from it, even as augmented and elucidated by his followers; but I am humbly of opinion that, in their great outlines, his doctrines are correct representations of natural facts. . . . The future of phrenology will probably exhibit a slow and gradual progress of the opinion that it is true and important; and only after this stage shall have been passed, will it be seriously studied as science. Hitherto this has not been done: the number of those who have bestowed on it such an extent of accurate and varied observation and earnest reflection as is indispensable to acquiring a scientific knowledge of chemistry, anatomy, natural philosophy, or any other science, is extremely small; and the real knowledge of it, on the part of such as continue, through the press and in public lectures, to oppose it, appears to me scarcely greater than it was in 1815 and 1826,' when it was ridiculed in the *Edinburgh Review*.

In considering the claims of phrenology, two questions should not be confounded. One is—How far the functions of the different parts of the brain have been established by observation of extreme instances of their large and small development?—the other, To what extent the facts so ascertained can be applied physiognomically in practice? Gall disclaimed the ability to distinguish either ill-defined modifications of forms of the skull, or the slighter shades of human character (*Sur les Fonctions du Cerveau*, iii. 41); nor, we believe, did he or Spurzheim ever pretend to estimate the size of every organ in a single brain. By attempting too much in these directions some of their disciples may have helped to prolong the incredulity with which phrenology is still widely regarded.

For the titles of numerous books on phrenology, see GALL (F. J.), SPURZHEIM (J. G.), and COMBE (G.); also an article in *The British and Foreign*

Medical Review, vol. ix. p. 190. Among the more recent works bearing on, or criticising phrenology, we may mention Dr Laycock's *Mind and Brain, or the Correlation of Consciousness and Organisation* (2 vols. Edin. 1860); his article on Phrenology in the 8th ed. of the *Encyc. Brit.*; an article on Phrenological Ethics in the *Edinburgh Review* for January 1842, vol. lxxiv. p. 376; Aug. Comte's *Philosophie Positive*, tom. iii. (or Miss Martineau's transl., i. 466); Sir Benj. C. Brodie's *Psychological Inquiries*, Dialogue vi. (Lond. 1854); G. H. Lewes's *Biog. Hist. of Philos.*, p. 629 (Lond. 1857); Samuel Bayley's *Letters on the Philosophy of the Human Mind*, 2d Series, Letters xvi.—xxi. (Lond. 1858); and Professor Bain *On the Study of Character, including an Estimate of Phrenology* (Lond. 1861). Sir William Hamilton's objections, mostly published many years since, and which are now appended to his *Lectures on Metaphysics*, i. 404 (Edin. 1859), were discussed in the *Phren. Jour.*, vols. iv. and v., and are remarked on by Mr Combe in his work *On the Relation between Science and Religion*, pref., p. xvii. (Edin. 1857).

PHRYGANEÆ. See CADDICE.

PHRYGIA, a country in Asia Minor, the extent and boundaries of which varied very much at different periods of ancient history. In pre-historic ages it is believed to have comprised the greater part of the peninsula, but at the time of the Persian invasion it was limited to the districts known as Lesser Phrygia and Greater Phrygia—the former stretching from the Hellespont to Troas (inclusive), the latter occupying a central portion of Asia Minor. The inland boundaries of Lesser Phrygia are not well ascertained; but Greater Phrygia was bounded on the N. by Bithynia and Paphlagonia, on the E. by Cappadocia and Lycaonia, on the S. by the Taurus range, and on the W. by the maritime countries of Mysia, Lydia, and Caria. At a later period it was considerably reduced by the formation of Galatia (q. v.) and the extension of Lycaonia. P. was in general a high and somewhat barren plateau, though its pastures supported immense flocks of sheep, noted for the fineness of their wool, as indeed they still are. The most fertile part was the valley of the Sangarius, but the most beautiful and populous district was the southwest, at the base of the Taurus, where the Mæander and other streams had their rise. The mountains and streams yielded gold; Phrygian marble was anciently celebrated, and the cultivation of the vine appears to have been extensively carried on.

The origin of the Phrygians is one of the mysteries of ancient ethnology. Some think that they were settled at a very remote period in Europe, and that they emigrated from Thrace into Asia Minor; and Xanthus, Herodotus, and Strabo certainly speak of such a migration. Xanthus places it after the Trojan war; but if there be any truth in the tradition at all, it can only refer to a return of some tribes to the cradle of the race in the valley of the Sangarius, for the Phrygians were regarded as one of the oldest races (if not the very oldest) in Asia Minor. Instead of seeking for their origin in Thrace, the best classical ethnologists seek for it in the neighbouring highlands of Armenia, whence the Phrygians are believed to have spread at a period far before the dawn of authentic history over the greater part of the Peninsula, and thence to have crossed into Europe, and occupied the greater part of Thrace, Macedonia, and Illyria; while the mythic Pelops, who colonised the Peloponnesus, and gave it his name, was said by tradition to be a Phrygian. In both Greek and Latin poetry the Trojans are also called Phrygians, and the same name is applied to other nations of Asia Minor, such as the Mydonians and

Mysians. In Thrace, too, many of the names of places were the same as in Troas; while it has now been demonstrated that the Armenian, Phrygian, and Greek languages are akin to each other, so that the peoples speaking the two former tongues, like those speaking the latter, belong to the great Aryan branch of the human family. The Phrygians began to decline in power and numbers after the Trojan war. They were—if we can make anything like historic fact out of the mythic narratives of that early time—pushed out of Europe by the Illyrians in the north and the Macedonians in the south, while in Asia Minor the rise of the Semitic Assyrians also depressed and weakened them, by breaking up the integrity of their territory. The whole of the south coast of the peninsula was occupied by Semitic invaders; the Lydians and Cappadocians were of Syro-Phœnician origin; and Strabo speaks of structures of Semiramis as far north as Pontus. Their language, manners, and religion even, underwent radical changes—hence the great difficulty experienced in ascertaining their original characteristics. After being subjugated by Cœsus, they passed, on the dissolution of the Lydian monarchy, under the sway of Cyrus; and it is only from this date that they are brought within the pale of positive history. Their country formed part of the empire of Alexander, and subsequently belonged to the Syrian Seleucidæ, to the kings of Pergamum, and to the Romans, who obtained possession of it, 133 B.C.

The Phrygians had not a warlike reputation among the ancients, but though in later times commonly described as indolent and stupid, yet, like negroes, they were of a mystic and excitable disposition. Their religious orgies, accompanied by wild music and dancing, are frequently mentioned by classic writers, and appear to have exercised a very material influence on Hellenic worship. Cybele, 'the great mother of the gods,' was the chief Phrygian divinity; others were Sabazius (Dionysus), Olympus, Hyagnis, Lityerses, and Marsyas.

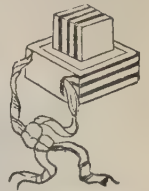

PHRYNĒ, one of the most celebrated courtesans of antiquity, was the daughter of Epicles, and was born at Thespie in Boeotia. Her position in life was originally very humble, and she is said to have at one time earned a livelihood by gathering capers; but as the fame of her marvellous beauty spread, she obtained numerous lovers, who lavished gifts on her so profusely that she became enormously rich. In proof of this, the story goes that she offered to rebuild the walls of Thebes, if the citizens would allow her to place this inscription on them: 'Alexander destroyed them; Phryne, the courtesan, rebuilt them.' The Thebans declined the proposal. Her enemies accused her of profaning the Eleusinian mysteries. Summoned before the tribunal of the Heliasts, she was defended by the rhetorician Hyperides, one of her lovers, who, perceiving that his eloquence failed to convince the judges, threw back her veil, and displayed her naked shoulders and bosom. She was immediately acquitted, and carried in triumph to the Temple of Venus. The famous picture of Apelles (q. v.)—the 'Venus Anadyomene'—is said to have been a representation of P. Praxiteles, also a lover of hers, employed her as a model for his 'Cnidian Venus'.

PHTHISIS See CONSUMPTION.

PHULWARA TREE. See BASSIA.

PHYLA'CTERY (from Gr. *phyllasso*, to guard), an amulet or charm worn by the Greeks against demoniac influences. Certain strips of parchment, inscribed with certain passages from the Scripture (Exodus xiii. 1—10, 11—16; Deuteronomy vi. 4—9, xi. 13—21), enclosed in small cases, and fastened

to the forehead and the left arm (*Tefillin*)—also, in another form, to door-posts (*Mezuzah*)—in use with the Jews, in imagined accordance with Exodus xiii. 9—16, &c., are also called in the New Testament phylacteries. The writing of these is in the hands of privileged scribes (*Soferim*) only, and many and scrupulous are the ordinances which they have to follow in the execution of this task. Only vellum of a very superior kind is to be used; the characters must be traced with the greatest care; no erasures or corrections are allowed; the lines and letters must be of equal length; &c. The case in which they are enclosed consists of several layers of calf-skin or parchment. It may be observed, by the way, that not the wearing, but the exaggerated form of the phylacteries worn by some of the Pharisees, is inveighed against by Christ.

Phylactery.

PHYLLOSO'MA. See GLASS-CRABS.

PHYSA'LIA, a genus of *Acalephæ*, having an oval or oblong body, which consists in great part of an air sac, so that the creature floats on the surface of the sea, with numerous appendages of various kinds hanging from its under side. The shorter of these appendages are suckers, which are kept in constant motion for procuring prey, and which seem also to be employed in extracting nutriment from it, as the P. has no proper mouth nor alimentary canal. Among these shorter appendages, also, some seem to be devoted to the purpose of reproduction by germination. The longer appendages, which are extremely long—those of a P. five or six inches in length, being capable of extension to twelve or eighteen feet—are rope-like tentacles, possessing a remarkable stinging power, which is probably used for benumbing prey. It is a common trick with sailors to make a novice pick up a P., the beautiful colours of which always attract admiration. The stinging power is, however, such as not merely to produce local pain, but constitutional irritation. It was at one time supposed that the P. has the power of expelling air from its bladder, and sinking at pleasure in the sea; but the observations of Mr Bennett (*Gatherings of a Naturalist in Australia*) render it more probable that it always floats on the surface, and is driven about by the winds. The name *Portuguese Man-of-War* is often popularly given to the species of P., and particularly to *P. pelagica*. The *Physalies* are inhabitants of the seas of warm latitudes, but shoals of them are occasionally driven to the American coasts.

Portuguese Man-of-War (*Physalis pelagica*).

PHYSALIS, a genus of plants of the natural order *Solanaceæ*, remarkable for the calyx, which becomes large and inflated after flowering is over, and encloses the ripened berry. The species are annual and perennial herbaceous plants and shrubs, natives of temperate and warm climates, and widely scattered over the world. The COMMON WINTER CHERRY (*P. alkekengi*) is a perennial, native of the south of Europe and great part of Asia, growing in vineyards and bushy places. It is not a native of

Britain, but is pretty frequent in flower-gardens. It has ovate triangular downy leaves, dirty-white flowers; and the fruit when ripe is a shining red berry, enclosed in a very large vermilion-coloured bladder. The berries have a sweetish subacid taste; they are seldom eaten in Britain, but very generally

Love Apple (*Physalis edulis*).

in many parts of the continent of Europe. They are refrigerant and diuretic, and were formerly employed in medicine on account of these properties.

—THE DOWNY WINTER CHERRY, or PERUVIAN GOOSEBERRY (*P. pubescens* or *P. Peruviana*), is an annual American species, densely clothed with down; with heart-shaped leaves, yellow flowers, and yellowish berries which are eatable, and when preserved with sugar, make an excellent sweetmeat. It is cultivated and naturalised in many of the warmer parts of the world, and sometimes ripens its fruit in England, and even in Scotland.—Some of the other species of *P.* are among the most common weeds of the West Indies and tropical America; and three or more species—the *P. angulata*, *pubescens*, and *viscosa*—are known in the Northern U. States.

PHYSETER. See CACHOLOT.

PHYSIC NUT (*Curcas*), a genus of plants of the natural order *Euphorbiaceæ*, having a 5-partite calyx, 5 petals, and 8–10 unequal-united stamens. The species are not numerous. They are tropical shrubs or trees, having alternate, stalked, angled or lobed leaves, and corymbs of flowers on long stalks; and notable for the acrid oil of their seeds. The COMMON P. N. of the East Indies (*C. purgans*), now also common in the West Indies and other warm parts of the world, is a small tree or bush, with a milky juice. It is used for fences in many tropical countries, and serves the purpose well, being much branched and of rapid growth. The seeds are not unpleasant to the taste, but abound in a very acrid fixed oil, which makes them powerfully emetic and purgative, or in large doses poisonous. Instances have recently occurred of very alarming, although not fatal, results from the eating of the seeds, imported into Britain under the name of *Physic Nuts*, *Jatropha Nuts* or *Jatropha Seeds* (the Linnean name of the plant being *Jatropha purgans*), and *Barbadoes Nuts* or *Barbadoes Seeds*. The expressed oil, commonly called *Jatropha Oil*, is used in medicine like croton oil, although less powerful; it is also used in lamps. The milky juice of the shrub is used by the Chinese for making a black

varnish, in order to which it is boiled with oxide of iron.—THE FRENCH P. N., or SPANISH P. N. (*C. multifidus*), a shrub, native of the tropical parts of America, with many-lobed leaves, yields a purgative acrid oil, called *Oil of Pinhoen*. It is very similar in its qualities to the oil obtained from the former species, perhaps stronger. To this genus belongs the PINONCILLO (*C. lobatus*) of Peru, the seed of which is eaten when roasted, and has an agreeable flavour, although when raw it is a violent purgative. When an incision is made in the stem of this tree, a clear bright liquid flows out, which after some time becomes black and horny. It is a very powerful caustic, and retains this property for years.

PHYSICAL GEOGRAPHY. See GEOGRAPHY.

PHYSICIANS, THE ROYAL COLLEGE OF (of London), was founded in 1518 by the munificence of Thomas Linacre, a priest and distinguished physician, who was born in 1460, and died in 1524. In 1518, through the influence of Cardinal Wolsey, he obtained from Henry VIII. letters-patent granting to John Chambre, himself, and Ferdinandus de Victoria, the acknowledged physicians to the king, together with Nicholas Halsewell, John Francis, Robert Yaxley, and all other men of the same faculty in London, to be incorporated as one body and perpetual community or college. They were permitted to hold assemblies, and to make statutes and ordinances for the government and correction of the College, and of all who exercised the same faculty in London and within seven miles thereof, with an interdiction from practice to any individual unless previously licensed by the President and College. Linacre was the first president, and held the office till his death in 1524. The meetings of the College were held at his house in Knight-rider Street, which he bequeathed to the College, and which, until the year 1860, continued in the possession of that body. About the time of the accession of Charles I., the College, requiring more accommodation, took a house at the bottom of Amen Corner, which was subsequently purchased by Dr Harvey, and in 1649 was given by him to his colleagues. This was the seat of the College till 1666, when it was destroyed by the great fire of London. A new College was then built in Warwick Lane, and opened in 1674 under the presidency of Harvey's friend, Sir George Ent; and here the meetings were held till 1825, when the present edifice in Pall-Mall East was opened under the presidency of Sir Henry Hallford.

The reason for forming the incorporation, as set forth in the original charter, is 'to check men who profess physic rather from avarice than in good faith, to the damage of credulous people;' and the king (following the example of other nations) founds 'a college of the learned men who practise physic in London and within seven miles, in the hope that the ignorant and rash practisers be restrained or punished.' The charter further declares, that 'no one shall exercise the faculty of physic in the said city, or within seven miles, without the College licence, under a penalty of £5;' that, in addition to the president, 'four censors be elected annually to have correction of physicians in London and seven miles' circuit, and of their medicines, and to punish by fine and imprisonment;' and that 'the President and College be exempt from serving on juries.' Four years later, in 1522–1523, an act was passed confirming the charter, and enacting that 'the six persons before said named as principals and first-named of the said commonalty and fellowship, shall choose to them two men of the said commonalty from henceforward to be called and cleaped Elects, and that the same elects yearly choose one of them to be president of the said commonalty;' and

further directing that, in case of a vacancy by death or otherwise, the surviving elects 'shall choose, name, and admit one or two, as need shall require, of the most cunning and expert men, of and in the said faculty in London;' and that 'no person from henceforth be suffered to exercise or practise in physic except he be a graduate of Oxford or Cambridge, until such time as he be examined at London by the said president and three of the said elects, and have from them letters testimonials of their approving and examination.'

In 1540 an act was passed (32 Hen. VIII. c. 40) by which the President and College were exempted, in consequence of their professional duties, 'from keeping watch and ward, and from being chosen to the office of constable and other offices;' and the censors were authorised 'to enter apothecaries' houses, to search, view, and see their wares, drugs, and stuffs, and to cause to be brent, or otherwise destroyed, such as they find defective, corrupted, and not meet nor convenient to be ministered in any medicine for the health of man's body.' In this act it was further declared explicitly that 'surgery is a part of physic, and may be practised by any of the company or fellowship of physicians'—a doctrine which in later times has been totally repudiated by the collegiate body, who, until a few years ago, would not admit to their privileges a member of the Royal College of Surgeons, unless he formally resigned his surgical diploma (for which act of resignation the College of Surgeons charged him a fee of £5). Other 'Acts touching the Corporation of the Physicians, London,' were passed in 1553, 1814, and 1858 (the last being known as 'the Medical Act'), which require no special notice, except that the Medical Act provides for the granting of a new charter to the College, which was obtained in 1862. Finally, in 1860, 'an Act to Amend the Medical Act' was passed, which repeals the provisions of the act of Henry VIII. (1522—1523) as to the elects, on the ground that their main function was licensing country physicians (the class recognised as Licentiates *extra urban*), and that it has virtually ceased; and declares that 'the office and name of elects of the said College shall henceforth wholly cease,' and that the Presidency shall in future be an annual office, open to the Fellows at large, who shall also be the electing body.

The College has consisted, till the last few years, of *Fellows* (amongst whom were the eight Elects), who are a self-electing body, and were, until about 20 years ago, almost invariably graduates of Oxford or Cambridge; *Licentiates*, who were examined by the president and censors, and who alone, excepting the Fellows, had the privilege of practising in and within seven miles of London; and *Extra-licentiates*, who were examined by the Elects, and had the privilege of practising in any part of England excepting in and within seven miles of London. As at present constituted, it consists of Fellows, Members, Licentiates, and Extra-licentiates. The *Fellows* are elected from members of at least four years' standing, who have distinguished themselves in the practice of medicine, or in the pursuit of medical or general science or literature. The government of the College is vested in the President and Fellows only. The present *Members* consist of persons who had been admitted before February 1859 licentiates of the College; of extra-licentiates who have complied with certain conditions; and of persons who have attained the age of 25 years, who do not dispense or supply medicine, and who, after being duly proposed, have satisfied the College 'touching their knowledge of medical and general science and literature,' and that they have 'been engaged in the study of physic during a period of five years, of which

four years at least shall have been passed at a medical school recognised by the College.' The *members* constitute a portion of the corporation, in so far as they have the use of the library and museum, and the privilege of admission to all lectures, but they do not take any share in the government, or attend or vote at meetings. The *Licentiates* are not members of the corporation, and in their qualifications very much resemble those who have diplomas both from the College of Surgeons and the Apothecaries' Hall. They must be 21 years of age, and must have been engaged in professional studies for four years before being admitted to examination.

The fee for admission as a Fellow is 30 guineas, exclusive of stamp-duty; the fee for admission as a Member is 30 guineas; and the fee 'for the licence to practise physic as a Licentiate of the College' is 15 guineas.

The following by-laws of the College should be generally known. 1. No Fellow of the College is entitled to sue for professional aid rendered by him. This by-law does not extend to Members. 2. No Fellow, Member, or Licentiate of the College is entitled to assume the title of Doctor of Medicine unless he be a graduate in medicine of a university. 3. No Fellow or Member of the College shall officiously, or under colour of a benevolent purpose, offer medical aid to, or prescribe for, any patient whom he knows to be under the care of another legally qualified medical practitioner.

PHYSICS, or **PHYSICAL SCIENCE** (Gr. *physikos*, natural), comprehends in its widest sense all that is classed under the various branches of mixed or applied mathematics, natural philosophy, chemistry, and natural history, which branches include the whole of our knowledge regarding the material universe. In its narrower sense, it is equivalent to Natural Philosophy (q. v.), which, until of late years, was the term more commonly used in Great Britain, and denotes all knowledge of the properties of bodies as bodies, or the science of phenomena unaccompanied by essential change in the objects; while chemistry is concerned with the composition of bodies, and the phenomena accompanied by essential change in the objects; and natural history, in its widest sense, includes all the phenomena of the animal, vegetable, and mineral world. The application of the term *Physic* to a branch of this last—viz., the science of medicine—is peculiar to the English language.

PHYSIOGNOMY (Gr.), the art of judging of the character from the external appearance, especially from the countenance. The art is founded upon the belief, which has long and generally prevailed, that there is an intimate connection between the features and expression of the face and the qualities and habits of the mind; and every man is conscious of instinctively drawing conclusions in this way for himself with more or less confidence, and of acting upon them to a certain extent in the affairs of life. Yet the attempt to reach this conclusion by the application of certain rules, and thus to raise the art of reading the human countenance to the dignity of a science, although often made, has never yet been very successful. Comparisons have been instituted for this purpose between the physiognomies of human beings and of species of animals noted for the possession of peculiar qualities, as the wolf, the fox, &c. This was first begun by Della Porta, a Neapolitan, who died in 1615, and was afterwards carried further by Tischbein. The subject of physiognomy was eagerly prosecuted by Thomas Campanella; and when his labours had nearly been forgotten, attention was

again strongly attracted to it, although only for a short time, by the writings of Lavater (q. v.).

PHYSIOLOGY (Gr. *physis*, nature; *logos*, a discourse) is the science which treats of the phenomena which normally present themselves in living beings, of the laws or principles to which they are subject, and of the causes to which they are attributable. It is, in short, the *science of life*, and hence the term *Biology* (Gr. *bios*, life) has been adopted by some writers in place of physiology. Biology is, however, regarded by some authors (and, we think, correctly) as including in its scope more than physiology, as will be seen from the following extract from Professor Greene's remarks 'On the Principles of Zoology': 'Biology,' he observes, 'is that branch of scientific inquiry which undertakes to investigate the nature and relations of living bodies. Every living being may be regarded from two points of view, which it is necessary to distinguish clearly from one another. The first of these exhibits to us living beings as possessing definite forms, which, in most instances, are found to be made up of a number of dissimilar parts or *organs*; while the second takes cognizance of the vital actions or *functions* which these organs perform. That department of biology which determines the former is termed *Morphology*; that which investigates the latter, *Physiology*. Hence the nature of living beings is twofold—*morphological* and *physiological*.'—*A Manual of the Protozoa*, 1859, pp. ix—x.

PHYTOLACCA, a genus of exogenous plants, of the natural order *Phytolaccaceæ*. This order contains about 70 known species, half-shrubby and herbaceous plants, natives of warm parts of Asia, Africa, and America, and is nearly allied to the order *Chenopodiaceæ*, from which it is distinguished by the frequently numerous carpels, the corolla-like perianth when the carpel is single, and the stamens either exceeding the number of the segments of the perianth, or alternate with them. It is also nearly allied to *Polygonaceæ*. The genus *Phytolacca* has for its fruit a berry with 8–10 cells, each cell one-seeded. *P. decandra*, the Poke or Pocan, a native of North America, now naturalised in some parts of the south of Europe, is sometimes cultivated for its young shoots, which, when blanched, are eaten like asparagus. Yet the leaves are acrid, and the root is an emetic almost or altogether equal to ipecacuanha. The root is also externally applied to cure itch and ringworm. A tincture of the ripe berries, which are fully larger than Black Currants, and grow in racemes, is efficacious in chronic rheumatism and syphilitic pains. By some it is held to be more valuable than guaiacum. The pulp of the berries is employed in the adulteration of wine.—The young shoots of *P. acinosa* are boiled and eaten in the Himalayas, those of *P. octandra* in Cayenne, and a Chinese species has recently been introduced into British gardens for the same use under the name of *P. esculenta*.

PHYTOLOGY, another name for Botany, not much in use.

PHYTOZOA (Gr. *phyton*, a plant; *zōon*, an animal), also called *Antherozoids*, are minute bodies produced amidst a mucilaginous fluid in the antheridia of many cryptogamous plants (Algae, Hepaticæ, Mosses, Ferns), which are either aquatic or delight in moist situations. In some many-celled antheridia of the higher cryptogamous plants, each cell is devoted to the production of a single phytozoon. When the antheridium is mature, and bursts, the phytozoa move for a short time by means of cilia—a provision, apparently, for their reaching the pistillidia, the spores contained in which—according

to an opinion rapidly gaining ground among botanists—they are destined to fertilise. Great diversities exist in the phytozoa of different cryptogamous plants. The annexed figure will convey a better notion of them than any mere description.

Phytozoa:

(From Carpenter on the Microscope.)

- A. Antherozoids of *Fucus platycarpus* (a sea-weed), some of them free, others still included in their antheridial cells.
- B. Cellular contents of an antheridium of *Polytrichum commune* (a moss), mature and discharging the antherozoids.
- C. Antherozoid of *Pteris serrulata* (a fern) shewing *a*, its large extremity; *b*, its small extremity; *d, d*, its cilia.

Cryptogamous plants, which, as lichens, live in dry situations, have no phytozoa, although it is supposed that they have organs destined to the same purpose, but destitute of the power of motion by cilia.

PIACENZA, a city of Northern Italy, in the province of the same name, on the right bank of the Po, 2 miles below the confluence of the Trebbia with that river, and 36 miles west-north-west of the city of Parma. Beautifully situated on a fine plain, confined on the south by well-cultivated hills, the city itself is gloomy and desolate in appearance. Its streets are broad and regular—that called the *Stradone* is one of the most beautiful in Italy—but many of them are unfrequented and grass-grown. It contains numerous palaces, and about 50 churches. The cathedral, an edifice in the ancient Lombard style, founded in the 11th c., is famous for the richly-curious and grotesque character of its internal decorations, for its numerous sculptures, its paintings, and for a number of frescoes of great grandeur, by Caraccio, Guercino, and others. The Church of Sant' Antonio, the original cathedral of P., was founded in 324 A.D., but has been several times rebuilt. Among the other principal buildings, are the Palazzo Farnese, founded in 1558, and once a sumptuous edifice, but which has been long in use as a barrack; the Palazzo del Comune, and the Collegio dei Mercanti are fine monuments of art. The principal square is the Piazza Cavalli, so called from the colossal bronze equestrian statues of the dukes Alessandro and Rannuccio Farnese. This town occupies by far the most important position in a military point of view, in Italy—a fact which was fully appreciated by those who fortified it with solid walls and a strong castle, which, till 1859, were guarded by the Austrians. On being forced from the city by the war of 1859, the Austrians did not destroy the works, and the Italian government has strengthened and extended them by the formation of externally defended works, and of a formidable entrenched camp, which unites and protects the other works on the right bank of the Po

Manufactures of silks, fustians, linens, hats, &c., are carried on to some extent. Pop. (which has considerably decreased within the last few years) in 1872, 34,985; (1879) 31,094.

P., called by the Romans *Placentia*, on account of its pleasing situation, first mentioned in 219 B.C., when a Roman colony was settled there. In 200 B.C., it was plundered and burned by the Gauls, but rapidly recovered its prosperity, and was long an important military station. P. was the western terminus of the great Æmilian road, which began at Ariminum on the Adriatic. Later it played a part as one of the independent Lombard cities.

PIANA DE' GRECI. See SUPP. in Vol. X.

P'A MA'TER. See NERVOUS SYSTEM.

PIA'NO (Ital. *soft*), abbreviated *p*, is used in music to denote that the strain where the indication occurs is to be played with less than the average intensity of force. *pp*, or *ppp*, for *pianissimo*, signifies very soft, or as soft as possible. In contradistinction from *piano*, *forte*, abbreviated *f*, is used to denote a more than usual force; and *f*, or *fff*, for *fortissimo*, a still greater degree of force. The gradual transition from *piano* to *forte* is indicated by the sign <; from *forte* to *piano* by the sign >.

PIANOFORTE (Ital. *piano*, soft, and *forte*, loud), a stringed musical instrument, played by keys, developed out of the Clavichord and Harpsichord (q. v.), from which the pianoforte differs principally in the introduction of hammers, to put the strings in vibration, connected with the keys by a mechanism that enables the player to modify at will the intensity of the sounds; whence the name of the instrument.

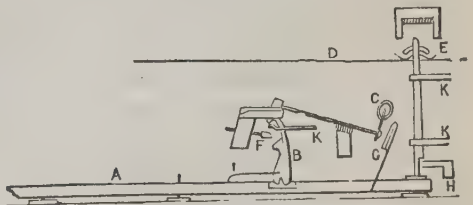

The idea of the pianoforte was conceived independently about the same time by three persons in different parts of Europe—a German organist of the name of Schröter; Marius, a French harpsichord-maker; and Bartolomeo Cristofali, a harpsichord-maker of Padua. Priority in point of invention (1714) is due to the Italian maker. Schröter's discovery was followed up in Germany by Silbermann of Strasburg, Spät of Ratisbon, Stein of Augsburg, and others. The first pianoforte seen in England was made at Rome by Father Wood, an English monk there. A few German manufacturers and workmen settling in London, gave an impetus to the new instrument. The English pianoforte has been brought to its present state of perfection by a succession of improvements received at the hands of Broadwood, Stodart, Erard, Clementi, Collard, Wornum, Hopkinson, and other makers. All the really important later inventions are English. The compass of the early pianoforte was, like that of the harpsichord, four to five octaves, from which it has been gradually increased to 6½, or seven octaves, or occasionally more.

The most natural of the various forms which the instrument assumes is that of the grand pianoforte, derived from the harpsichord, with the strings placed horizontally, and parallel to the keys. The strings are stretched across a compound frame of wood and metal, composed of bars, rods, and strengtheners of various kinds—appliances necessary to resist the enormous tension. This framework includes a wooden sound-board. The mechanism by which hammers are connected with the keys, is called the *action* of the instrument. In the earliest pianofortes, the hammer was raised from below by a button attached to an upright wire fixed on the back-end of the key. The impulse given to the hammer caused it to strike the string, after which it immediately fell back on the button, leaving the string free to vibrate. This was called the *single action*. As the hammer, when resting on the button with the key pressed down, was thus necessarily

at a little distance from the string, the effectual working of this action required that a certain impetus should be communicated to the hammer to enable it to touch the string. Hence it was impossible to play very piano, and it was found that if the hammer was adjusted so as to be too close to the string when resting on the button, it was apt not to leave the string till after the blow had been given, thereby deadening the sound. This defect was remedied by a jointed upright piece called the *hopper*, attached to the back-end of the key, in place of the wire and button. When the key was pressed down, the hopper, engaging in a notch in the lower side of the hammer, lifted it so close to the hammer, that the lightest possible pressure caused it to strike; and at this moment, when the key was still pressed down, the jointed part of the hopper, coming in contact with a fixed button as it rose, escaped from the notch, and let the hammer fall clear away from the string. To prevent the hammer from rebounding on the string, a projection called the *check* was fixed on the end of the key, which caught the edge of the hammer as it fell, and held it firmly enough to prevent it from rising. A necessary part of the action is the *dampers*, which limits the duration of each particular note, so as to cause it to cease to sound as soon as the pressure is removed from the key. It consists of a piece of leather resting on the top of the string, and connected with the back-part of the key by a vertical wire. When any key is pressed down, its damper is raised off the string, so as to allow the sound produced to be clear and open; but immediately on the finger being lifted off the key, the damper-wire falls, and the damper again presses on the string, muffling and stopping the vibration. The whole range of dampers may, when required, be raised by the use of the damper pedal, so as to prolong the sound of one note into another.

One further frequent and important addition to the action may be alluded to. In the mechanism above described, the key must rise to its position of rest before the hopper will again engage in the notch of the hammer for another stroke; hence, a note cannot be repeated until time has been allowed for the full rise of the key. The *repetition action* is a contrivance, varying in different instruments, for getting rid of this defect, by holding up the hammer at a certain height while the key is returning.

Great difference of detail exists in the actions of different makers. Some are more complicated than others; but in all are to be found the same essential parts, only modified in shape and arrangement. The subjoined figure represents one of the simplest grand pianoforte actions now in use. A is the

key, B the lever which raises the hammer, C the hammer, D the string, and E the damper; F is the button which catches the lever after it has struck the hammer, G the check, H the damper pedal-lifter, I the spring, and K, K, K are rails and sockets.

Formerly, the strings of the pianoforte were all of thin wire; now, the bass-strings are very

thick, and coated with a fine coil of copper-wire; and the thickness, strength, and tension of the strings all diminish from the lower to the upper notes. A grand pianoforte has three strings to each of the upper and middle notes, and now, generally, only two to the lower notes, and one to the lowest octave. When the soft pedal is pressed down, the hammers are shifted sideways, so as to strike only two strings instead of three, or one string instead of two.

Besides the grand, the kinds of pianoforte in use are the square, in which the strings are placed still in a horizontal position, but obliquely to the keys; and the upright, in which the strings run vertically from top to bottom of the instrument. The difference in form necessitates alterations in the details of the action, but the general principle is the same.

The pianoforte has in modern times attained a widespread popularity beyond that of any other musical instrument. It possesses nearly all the powers of expression of any other instrument; on no other except the organ can we execute such complete successions of harmonies; no other represents the orchestra so well, with the advantage that the various parts adapted to it are brought out by the same performer. In all cities of the civilised world, there are numerous manufacturers of the pianoforte, employing multitudes of workmen; and even in the secondary towns of Europe, the number of makers is daily increasing. In England, the manufacturers who have for some time past enjoyed the highest repute are Messrs Broadwood, Collard & Co., and Erard; but other makers are rapidly approaching them in excellence. Till lately, the German makers adopted a much less perfect action than the English, producing a very different touch and tone; but they are now largely using the English action, which is spreading over the continent. Music for the pianoforte is written in two staves, and on the treble and bass-clefs. Many of the most eminent musicians have devoted themselves to composing for the pianoforte, and some composers of note, as Hummel, Czerny, Kalkbrenner, Chopin, Thalberg, Liszt, and Heller, have almost entirely confined themselves to that instrument. See Rimbault, *The Pianoforte, its Origin, Progress, and Construction* (Lond. 1860).

PIARISTS, called also familiarly *Scolopini*, or 'Brethren of the Pious Schools,' a religious congregation for the education of the poor, founded at Rome in the last year of the 16th century. The originator of this institute was a Spanish priest, named Joseph of Calasanza, who, while in Rome, was struck with the imperfect and insufficient character of the education which then prevailed, even for the children of the higher classes, and conceived the idea of organising a body for the purpose of meeting this want, which the Jesuit Society had already partially supplied. The school which he himself, in conjunction with a few friends, opened, rapidly increased in number to 100, and ultimately to 700 pupils; and in 1617, the brethren who, under the direction of Joseph, had associated themselves for the work, were approved as a religious congregation by Paul V. (q. v.), who entered warmly into this and all other projects of reformation. In 1621, Gregory XV. approved the congregation as a religious order. The constitution of the order was several times modified by successive popes, down to the time of Innocent XI. Its field of operations has, of course, been confined to European countries; and at present it can reckon communities in Italy, Austria, Spain, Hungary, and Poland. In Italy, during the revolutionary wars, the P. received into their ranks many members of the suppressed Society of the Jesuits. In Spain, their establishments were spared,

on the general suppression of religious orders in 1836. In Poland, eleven houses still were in existence in 1832. The number of members in Hungary is said to be about 400, and the order is also found in the other dependencies of Austria. See Wetser's *Kirchen-Lexicon*.

PIA'SSABA, or PIACABA, a remarkable vegetable fibre which, during the last twenty years, has become an article of much importance in this country. It is procured from Brazil, chiefly from the ports of Para and Maranhão, and is produced by one or more species of palm. That which furnishes the greater part is the Coquilla-nut Palm (*Attalea funifera*); but Mr Wallace states that much of it is procured from a species of *Leopoldinia*, which he has named *L. piassaba*. The fibre is produced by the stalks of the large fan-like leaves. When the leaves decay, the petioles or stalks split up into bundles of cylindrical fibres of a dark-brown colour, and of a hard texture, varying in thickness from that of a horse-hair up to that of a small crow-quill. This material has been found of great utility in making brushes of a coarse kind, particularly those required to sweep the street; and for this purpose they have almost superseded birch-brooms, split whale-bone brushes, and other similar means for scavengers' work. The coarsest fibres are best for such purposes, and the finer ones are found very valuable for finer kinds of brushes.

PIA'STRE (Gr. and Lat. *emplastron*, a plaster; transferred in the Romanic languages to anything spread out or flattened, a plate, a coin), a Spanish silver coin which has been extensively adopted by other nations. It was formerly divided into 8 silver reals, and hence was termed a *piece of eight*, which name was invariably applied to it by the Buccaneers of the Spanish Main. The present Spanish piastre, commonly known as the *peso duro*, *peso fuerte*, or, briefly, *duro*, is the standard of the money system, and is equivalent to about 4s. 3d. of our money. It is divided into 20 copper reals (*reales de vellón*). In the Levant, the piastre is called a *colonnato*, on account of the original coins, which were struck for use in Spanish America, bearing two columns on the reverse side.—The Italian piastre, or *scudo*, is an evident imitation of the Spanish coin, and is exactly equal to it in value.—The same is true of the piastres in use in Chili, Mexico, and South America, with the sole exception of New Granada, where it is about 2½d. sterling less. The Dollar (q. v.) of the United States of North America was adopted from the Spanish piastre, but is a fraction less in value, owing, it is said, to an error in the original estimate. The original Spanish 'pillar' piastres or dollars are current nearly all over the world.—The coin known as the Turkish piastre is not an imitation, but is an independent national silver coin, which, in 1753, was worth about 3s. 6d. sterling, but has since gradually and rapidly deteriorated, till at the present day it is equal to not more than 2½d. of our money.—The Egyptian piastre is worth about 2½d. sterling. Pieces of 2, 5, 10, and 20 piastres are struck in silver, and of 50 and 100 in gold; the piece of 100 piastres being in Egypt the exchange at par for £1 sterling.

PIA'ZZA, an open place or square. The name is also applied to a portico or arcade, such as often surrounds a piazza in warm countries.

PIAZZI, GIUSEPPE, a celebrated astronomer, was born at Ponte in the Valteline, July 16, 1746. He was received into the order of the Theatins at Milan in 1764; and studied in that city, and subsequently in the houses of the same order at Rome and Turin. Summoned to the professorial chair of Philosophy at Genoa, he so alarmed the Dominicans by the

freedom and boldness of his opinions, that his friend the grand-master thought it desirable to remove him to Malta, where, in 1770, he became Professor of Mathematics in the newly-founded university. On the breaking up of this seminary, he returned to Italy, and after teaching philosophy in the Nobles' College at Ravenna, he went to Rome, where he became Professor of Dogmatic Theology in the institution of San Andrea della Valle. He was transferred in 1780 to the chair of Mathematics in Palermo; and after some time, obtained the consent and aid of government to establish an observatory at Palermo, which was put in working order in 1789. The first results of his observations were, the rectification of some errors in the estimation of the obliquity of the ecliptic, the aberration of light, the length of the tropical year, and the parallax of various heavenly bodies; these results were published in 1792. P. had now attained a European reputation, which was further heightened by his discovery, on the night of 1st January 1801, of a new planet, the first known of the great group of planetoids between Mars and Jupiter. P. was only able to give a description of it, accompanied with some hypotheses of his own, to some of the German and Italian astronomers, when it disappeared; Gauss (q. v.), however, rendered certain the fact of its being a planet. It received from P. the name Ceres, after the ancient goddess of Sicily. P. was so sincerely attached to Sicily, which he regarded as if it were his native country, that all the splendid offers of Napoleon were insufficient to induce him to remove to Bologna. In 1803, he published a map of the fixed stars, far superior to any before published, the result of ten years' observations: the work was crowned by the Institute of France. In 1814, appeared a new and more complete catalogue (containing 7646 stars), for which he was again rewarded with a prize from the French Institute. He also made researches into the nature of comets, aided to regulate the weights and measures of Sicily, and devoted the later years of his life to the improvement of public education in Sicily. He wrote a number of works, of which, besides the two catalogues of stars above mentioned, the *Lezioni Elementari di Astronomia* (Palermo, 1817) is the chief. He is also the author of many memoirs drawn up for the various scientific societies of Europe. P. died, 22d July 1826, at Naples.

PIBROCH, a species of martial music performed on the bagpipe of the Highlanders, which has been found to have a wonderful power in arousing their military instincts. Its rhythm is so irregular, and its notes in the quicker parts so much jumbled together, that a stranger has difficulty in following the modulations or reconciling his ear to them. The earliest mention of the military music of the bagpipe is in 1594, at the battle of Balrinnies; indeed, prior to that period, the bagpipe can hardly be looked on as a national instrument of Scotland. There are appropriate pibrochs belonging to various clans and districts, but some of these may not be older than the beginning of last century. One of the oldest known pibrochs is called the 'Battle of Harlaw,' but it may be doubted whether it was contemporary with that event (1411). In the ballad account of that battle, there is mention of trumpets and horns, but none of the bagpipe; and the pibroch style of music has so obvious a relation to the bagpipe, that it is difficult to suppose that it preceded the use of that instrument. According to Sir Walter Scott, the connoisseurs in pipe-music affect to discover in a well-composed pibroch the imitative sounds of march, conflict, flight, pursuit, and all the current of a heady fight. Many remarkable instances have been recorded of the effect of the pibroch on the

Highlanders. At the battle of Quebec, in April 1760, whilst the British troops were retreating in confusion, the pipers were ordered to strike up a favourite pibroch, and the result was that the Highlanders, who were broken, rallied the moment that they heard the music, and formed with great alacrity in the rear.

PICARDY (**PICARDIE**), an ancient province in the north of France, was bounded on the W. by the English Channel, and on the E. by Champagne. The name does not occur till the 13th century. The capital of this province was Amiens. The territory now forms the department of *Somme*, and portions of the departments of *Aisne* and *Pas-de-Calais*.

PICCOLO (Ital. *flauto piccolo*, small flute), a flute of small dimensions, having the same compass as the ordinary flute, while the notes all sound an octave higher than their notation. In joyous as well as violent passages, this instrument is sometimes very effective in an orchestra.

PICCOLOMINI, one of the oldest and most distinguished families of Italy, was originally settled at Rome, but afterwards removed to Siena, and subsequently obtained possession of the duchy of Amalfi. It has produced numerous celebrated *littérateurs* and warriors, one pope (PIUS II.), and several cardinals. One of the most distinguished in the history of this family was OTTAVIO P., the first Duke of Amalfi, born in 1599, and fifth in direct descent from Pope Pius II. He early entered the Spanish military service, and after taking part in the Milanese campaigns, was sent as captain with a Florentine cavalry regiment to aid Ferdinand II. against the Bohemians. As a cavalry leader, he distinguished himself; and from the regiment of cuirassiers under his command issued the death-dealing bullet to Gustavus Adolphus. In 1634, he was placed under the orders of Wallenstein, who took a great fancy to him, and confided to him his secret designs against the emperor; P., however, communicated these designs to the emperor, and received, as a reward for his fidelity, a part of Wallenstein's estates. During the remainder of this year, he was actively engaged against the Swedes, and greatly distinguished himself in the first battle of Nordlingen. In the following season he was sent with 20,000 troops to aid the Spaniards in the Netherlands, where the French and Dutch were carrying all before them. P. speedily drove out the French, but his success against the Dutch was not so marked. He was withdrawn by the emperor in 1640 to stay the Swedes, who, under Baner, were threatening the hereditary possessions of Austria; and his success against these invaders in Bohemia and the Palatinate, though damped by the defeat inflicted on him in Silesia by Torstensohn, induced the king of Spain to entreat the emperor to send him again to the Netherlands to take the command of the Spanish troops. But his success was not nearly so decisive as before, the prestige of the Spanish infantry having been completely destroyed by the great Condé at Rocroi (19th May 1643). P., however, was again successful against both the French and Dutch till 1648, when he was anew summoned to Germany to encounter the victorious Swedes; but after a brief campaign, the peace of Westphalia (1648) put an end to his career. He was created a field-marshal by the emperor, and was sent as plenipotentiary to the Congress of Nuremberg (1649), and soon after was raised to the

high dignity of a prince of the empire. The king of Spain conferred upon him the order of the Golden Fleece, and bestowed upon him in fief the duchy of Amalfi, which had previously belonged to his family. P. died at Vienna, 11th August 1656, leaving no children; his son Max, who figures in Schiller's *Wallenstein*, is only a poetical fiction. His fame as a warrior and general is somewhat tarnished by his cruel treatment of a number of Hessian and Lüneburger prisoners in 1640.

PICHEGRU, CHARLES, a French general, was born 16th February 1761, at Arbois, in the department of Jura, France. Though of humble parentage he succeeded in gaining admission to the college of his native town, where, and subsequently at Brienne, he received a thorough education. He was specially distinguished in mathematics, and had some thoughts of devoting himself to teaching as a profession; but the advice of Father Perault induced him to enter an artillery regiment in 1783, and he had risen to the rank of a lieutenant when the Revolution broke out. P. became an ardent democrat; joined the army of the Rhine, and by his brilliant soldierly qualities soon attracted general attention. In 1793, he became commander-in-chief of the army, and in conjunction with the army of the Moselle under Hoche, repeatedly defeated the Austrians, took from them many important towns, as Gernersheim, Spire, Worms, &c., and established himself in the Palatinate; while, after the arrest of his coadjutor Hoche, his success at the head of the combined Rhine and Moselle armies was not less decided. The rapidity and boldness of his manoeuvres, when he took the command of the army of the north, in 1794, disconcerted the allies; and before long they were compelled to retreat beyond the Meuse. After a brief respite, P. crossed this river, driving the British before him; and by February 1795, had completed the conquest of the Dutch towns and provinces, ending the campaign by capturing the enemy's fleet (which had been frozen in). He next visited Paris, and while there, suppressed an insurrection of the faubourgs (1st April 1795); but soon afterwards returned to the army, which was now opposed to the Austrians on the western frontier, and for some time displayed his usual skill and energy, crossing the Rhine in the face of the enemy, and capturing Mannheim, the chief fortress, on its banks. But the anarchy which he had found at Paris, combined with the flattering promises and bribes held out to him by the Prince of Condé, converted P. into a secret partisan of the Bourbons. His remissness, the unwonted folly and awkwardness of his military manoeuvres, though prearranged with the Austrian generals, was not suspected till he suffered himself to be shamefully defeated at Heidelberg, and then retreated, leaving Jourdan (q. v.) without support, thus compelling the latter also to retire. The suspicions of the Directory were now aroused, and being confirmed by the seizure of P.'s correspondence, he was immediately superseded by Moreau (q. v.), and retired to his native town, where he lived till 1797, when he was elected one of the council of Five Hundred. He soon became president; but continuing his intrigues with the Bourbons, he was arrested, and subsequently transported to Cayenne. Escaping in June 1798, he made his way to Surinam, whence he sailed for England. He now entered heart and soul into the Bourbon conspiracy along with George Cadoudal (q. v.), the two Polignacs, De Rivière, and others, the primary object being the assassination of the First Consul. The conspirators secretly reached Paris, and there P. attempted to persuade Moreau, who was also a royalist, to join with them, but

without success. But the plans of the conspirators were soon known to the police; and an intimate friend of P., with whom he resided, sold the secret of his retreat to the police for 100,000 crowns. P. was surprised in his sleep, and carried off naked to the Temple, where he was found dead in his bed on the morning of 6th April 1804. The Royalists have endeavoured to fasten a charge of private assassination on Napoleon, but it is more generally believed that P. strangled himself.

PICHI'NCHA, an extinct volcano in the west cordillera of the Andes, in Ecuador, about ten miles north-west of Quito. It is of irregular form, and is 14,984 feet in height. Around the crater are two other peaks of nearly equal elevation.

PICHLER, KAROLINE, one of the most eminent novelists of Germany, was born in 1769 at Vienna, where her father, Franz von Greiner, held several legal offices and court dignities. In 1796, she married Councillor Andrew Pichler, and published her first work under the title of *Gleichnisse* (Wien, 1800). This was quickly followed by other writings, as the novels *Olivier* (Wien, 1802); *Leonora* (Wien, 1804); *Ruth* (Wien, 1805), &c.; and the success which attended the appearance of these productions, encouraged her to try a more ambitious line of composition. In 1808 appeared *Agathokles*, which, according to some critics, is the best of her novels. In this work, she endeavoured, in opposition to the views expressed by Gibbon, in his *History of the Decline of the Roman Empire*, to depict the ennobling effect of Christianity on the human mind. At the suggestion of Hornayr and other literary friends, who had been struck by the success with which she threw herself into the spirit of the times of which she wrote, she turned her attention to the task of popularising German history, with the view of fostering a more general feeling of patriotism. Among her best works of this kind, which appeared between 1811 and 1832, and the earlier of which preceded Scott's greatest historical novels, we may instance *Grafen von Hohenberg* (Leip. 1811); *Die Belagerung Wien's von 1683* (Wien, 1824); *Die Schweden in Prag* (Wien, 1827); and *Henriette von England* (Wien, 1832); while of her social novels, the following are among the most popular: *Fräuleinwürde* (Wien, 1808); *Die Nebenbuhler* (Wien, 1821); and *Zeitbilder* (Wien, 1840). She died at Vienna in 1843. Her dramas were failures, and in her novels there is not a little tedious diffuseness, a remark which applies with equal truth to her autobiography, which appeared at Vienna in 1844 under the title of *Denkwürdigkeiten a. m. Leben*, and formed part of the edition of her collected works, published at Vienna in 1845 in sixty volumes.

PICKET, in Military Language, has several significations. It applies to a stake shod and sometimes ringed with iron, driven into the ground, and used to sustain ropes, which mark off sections in a camping-ground, or for tying horses to. These pickets are four or five feet long. Short pickets about eight inches long are employed as anchors for the ropes extending tents.—In Fortification, pickets are pointed stakes for pinning gabions together and to the ground; also, when pointed at both ends, and laid close together, of different lengths, and in a position inclined towards the front, they form a powerful obstruction to the advance of a storming-party, having a great effect in breaking a line of soldiers.—Picket was formerly a military punishment, where the culprit was held by the raised arm in such a position that his whole weight fell on one foot, which was supported on a picket with a blunt point. The time the man thus stood was proportioned to the offence. The punishment became

after a few moments, extremely painful : it has long been discontinued on sanitary grounds.—The word *picket*, when applied to a small guard of men, is ordinarily written *Piquet* (q. v.).

PICKLES. Although the term *pickled* is applied to animal substances, such as beef, pork, fish, &c., preserved in salt, yet pickles are generally understood to be the various parts of vegetables preserved in vinegar. The process employed is first to wash the articles intended for pickles in clean cold water, and afterwards to soak them for a few days in a strong solution of salt in water. They are next taken out, and if fruits or roots, dried in a cloth ; but if vegetables, such as cauliflower, &c., they must be well drained, and then placed in the vessels intended to hold them, a few peppercorns, or any other spice which is suitable, being sprinkled in from time to time. When the vessel is so far filled that it will hold no more, boiling vinegar is poured in until it is quite full, and tightly covered up. Many persons prefer to boil the spices, of whatever kind used, in the vinegar ; and some add the vinegar cold to such vegetables or fruit as are of a naturally soft substance, because, except in the case of green walnuts, and one or two other fruits, extreme softness is objectionable in pickles. When the materials to be pickled are naturally green, as in the case of gherkins or small cucumbers, French beans, &c., it is considered very desirable to preserve their colour as much as possible ; and it is sometimes very successfully accomplished by steeping vine, cabbage, spinach, or parsley leaves in the vinegar, by which their colour is imparted through the vinegar to the pickles. But this requires great care and patience, more, indeed, than is generally thought worth applying to it, and dealers consequently resort to very reprehensible methods of colouring their pickles, such as boiling the vinegar in copper vessels, and thereby forming an acetate of copper, which is green ; or even directly adding that salt to the pickles. Many serious accidents have resulted from the presence of this poison.

The principal pickles made in this country are *cabbage*, almost always made from the red variety ; to this is frequently added slices of beet-root, which are an agreeable addition, and improve the colour. The celebrated Spanish pickle is a mixture of the red cabbage and slices of the large Spanish onion. Some housewives, in their efforts to outrival their neighbours, add a little cochineal to improve the colour. The spices considered most suitable for pickled cabbage are white and black peppercorns, ginger, and mace.—*Cauliflowers*. Only the flower portion, with its white branches, is used, and in other respects they are treated as cabbage.—*Gherkins*, or very young cucumbers. These require the same spices as the cabbage ; but much care is required to keep as well as possible their green colour. This pickle is the one which British cooks and housewives most pride themselves upon making well ; and almost every one has some particular plan for its preparation. A very much approved method is to soak the gherkins in a brine, composed of six ounces of salt to the quart of water for twenty-four hours, then drain or dry in a cloth, place them in jars, and pour in the pickle, composed of vinegar, with an addition to each quart of one ounce salt, black peppercorns a quarter of an ounce, one ounce of ginger slightly bruised, one or two blades of mace, and a dozen bay-leaves. After soaking two days, they are set on the fire until they simmer, and then replaced in the jars, which must be well corked, and covered with skin, to exclude the air.—*French Beans*. The young green pods are prepared in the same way as gherkins.—*Onions and Eschalots* are carefully peeled, and, after

two days' steeping in brine, covered with boiling vinegar, to which the spice, usually black pepper-corns, has been added. A small variety of onion, called the silver-skin, is generally used.—*Walnuts*. These are gathered green, and so tender that a pin can easily be pushed through them : they are useless when the shell has begun to form. They require at least a week's steeping in the brine. The vinegar must be poured on them boiling hot. The spices used are peppercorns, mace, ginger, and sometimes a little garlic and cloves.—*Mushrooms* are sometimes pickled only in brine, and are very useful for gravies, &c., in winter-time. They are also preserved in vinegar, and must be washed in salt and water quickly, and then boiled in the vinegar, to which, besides the spices, a small quantity of salt is added.—*Nasturtiums*. The young green fruit or seeds of the Nasturtium plant, or greater Indian Cress (*Tropaeolum nasturtium*), make a most excellent pickle, which is an admirable substitute for the foreign capers in sauces for various dishes, and alone is an agreeable pickle.—Several kinds of mixed pickles are made, the chief of which is one called *Picailly*, or 'Indian Pickle,' which consists of a mixture of cucumber, cauliflowers, &c., with a considerable quantity of mustard-seed and flour of mustard used as a spice, which gives it a bright yellow colour.

Of the foreign pickles imported from other countries, we have the unopened buds of the beautiful plant *Capparis spinosa*, called *Capers* ; olives, pickled both in brine and vinegar, but chiefly in the former—both from Southern Europe. From tropical countries, every variety of the capsicum—green shoots of bamboo—and the fruit of the mango, which is in much esteem wherever it is known, notwithstanding a turpentine flavour, which is not agreeable at first. Besides these, there are numerous other pickles of less importance, almost every soft part of wholesome vegetables being adapted for this mode of preparation. Pickles generally are considered provocatives to appetite, and if used judiciously, and made properly, are wholesome and agreeable additions to our food.

PICO, one of the Azores Islands, stands midway between the eastern and western extremities of the group, a few miles south-east of Fayal. It is 45 miles long, and 5 miles in average width ; area about 225 square miles ; pop.—the descendants of Portuguese—about 30,000. It is traversed by a volcanic ridge, which rises 7613 feet high in the Peak (Pico), whence the name of the island. See AZORES.

PICO, GIOVANNI, DELLA MIRANDOLA, an Italian philosopher and theologian, whose genius is decidedly inferior to the reputation he once enjoyed, was the son of the sovereign prince of Mirandola and Concordia, and was born 24th February 1463. At the age of 14, he was sent to the university of Bologna, and after spending some years there, visited the principal schools of Italy and France, everywhere distinguishing himself by the extraordinary facility with which he mastered the most difficult branches of knowledge. His linguistic acquisitions embraced Latin, Greek, Hebrew, Chaldee, and Arabic, besides Italian and French ; he was familiar with the different phases of the scholastic philosophy, and he was also versed in mathematics, logic, and physics. At the age of 23, he returned to Rome, when Innocent VIII. was pontiff, and immediately sought an opportunity of shewing his learning in the most striking manner, by publicly posting up no fewer than 900 theses or propositions in logic, ethics, physics, mathematics, theology, natural and cabalistic magic, drawn from Latin, Greek, Jewish, and Arabic writers, offering to maintain an argument on each

against all the scholars of Europe, and undertaking to pay the expenses of those who came from a distance. P. presumptuously entitled his theses *De Omni Re Scibili* (On Everything that can be Known), and Voltaire sarcastically added, *et de quibusdam aliis*, which addition is as true as it is witty. P. had several encounters with notable scholars, and is reported to have come off victorious on every occasion. But his very success was the cause of misfortune. The church appointed a committee to report on the propositions of the young prince, and the result was that several of them were condemned as 'heretical,' although the author was acquitted of any heretical intentions. P. now withdrew from Rome, and after a short time settled in Florence, where he austere devoted his whole time to the composition of polemical treatises against Jews and Mohammedans, and to the refutation of judicial astrology. Among his closest friends were Politian and Picino. He died 17th November 1494, at the early age of 31. A complete edition of his works was published at Bologna in 1496; it has since been frequently reprinted. The principal are *Heptaplus, id est de Dei Creatoris Opere sex Dierum Libri Septem*, an allegorical explanation of Creation as recorded in the Book of Genesis; *Conclusiones Philosophicæ, Cabalisticæ et Theologicæ*—these are the famous propositions which excited so much ferment at Rome; *Apologia Concordiæ Comitiss; Disputationes adversus Astrologiam Divinatricem Libri xii.; Auræ ad Familiares Epistolæ; De Hominis Dignitate*. P. is a happy illustration of the immediate effects produced in literature by the 'revival of letters;' he is full of a specious kind of universal learning, zealous and enthusiastic, but destitute of originality, depth, or creative power. 'He was,' says M. Matter, 'a prodigy of memory, elocution, and dialectics, but neither a writer nor a thinker.'

PICOTEE. See CARNATION.

PICROTOXINE ($C_{12}H_{14}O_5$) is the active principle of *Cocculus indicus*, from which it may be extracted by boiling alcohol, or by water containing a little hydrochloric acid. It crystallises in colourless prisms. This substance is extremely poisonous, one-third of a grain being sufficient, when introduced into the stomach of a cat, to produce tetanic convulsions and death in ten minutes.

PICTOU', a thriving seaport on the north coast of Nova Scotia, on the north shore of an ample and perfectly protected harbour, 85 miles in direct line north-north-east of Halifax. Lat. of light-house, $45^{\circ} 41' N.$; long. $62^{\circ} 40' W.$ It stands in a fertile and well-cultivated district, with extensive coal-mines and quarries of building-stone in the vicinity. In the year ending June 30, 1870, 415,728 tons of bituminous coal were imported into the U. States, chiefly from Pictou. It also exports building-stone, dried fish, and potatoes. Its commerce is rapidly increasing. The mean summer temperature of P. is $63^{\circ} 52'$, and the mean temperature for the year is $42^{\circ} 09'$. Pop. about 3500.

PICTS, the ancient inhabitants of the north-eastern provinces of Scotland. Everything connected with the history of the P. has been made matter of controversy, and it is not easy to ascertain the truth, where the information given by early writers is so scanty, and where most modern authors seem only to have looked for materials to support a favourite theory.

It will be unnecessary to enter on an examination of the name itself. The 'Picti' of the Romans probably represented a word by which the nation was known in its own language, as well as the barbaric custom to which the well-known expression of Claudian, 'nec falso nomine Pictos,' bears reference. Of much more importance is the inquiry regarding

the origin and language of the Picts. This is what, among Scottish antiquaries, has been emphatically called 'the Pictish question;' respecting which the best-known and most amusing, and certainly not the least useful discussion, is that between Jonathan Oldbuck and Sir Arthur Wardour, in the sixth chapter of *The Antiquary*. The disputants can hardly even now be said to be agreed; but the prevailing opinion is, what sound criticism always pointed to, that the P. were a Celtic race—perhaps the first known inhabitants of Northern Britain, and (as some hold) to be identified with the Caledonians of the Roman writers. At the time when they became generally spoken of under the name of P., they occupied the whole territory north of the Firth of Forth, except the western portion, which had been colonised or subdued by the Scots, another Celtic nation, whose chief seat was in Ireland—the proper and ancient Scotland. The southern boundary of the P. was the Roman province of Valentia, embracing the territory between the two Roman walls. At a later period, when Britain was abandoned by its imperial rulers, the boundaries of the various nations occupying the northern part of the island may be traced with considerable distinctness. Making allowance for partial changes at various times, these boundaries may be held to be the following: The Pictish territory extended along the whole sea-coast from the Firth of Forth to the Pentland Firth. It was bounded on the west by the country of the Scots, which extended along the western coast from the Firth of Clyde to the modern Ross-shire; but the precise line between the two nations cannot be ascertained. The country of the P. was bounded on the south by the Firth of Forth and the province of Lothian, then possessed by the English; while the country of the Scots had for its southern boundaries the Firth of Clyde and the kingdom of Cumbria, held by the independent Britons.

The Pictish nation consisted of two great divisions, called the Northern and the Southern P., the boundary between them being the mountain range known afterwards as the Grampians. These divisions seem at some times to have been ruled by different princes, at other times to have been under one sovereign. The P. were converted to Christianity at different periods. The Southern P. received the faith from St Ninian, Bishop of Candida Casa, early in the 5th century. This is mentioned by Bede, and the fact itself has never been doubted; but controversy, as usual, has been busy with the details. The point in dispute is the situation of the P. who owed their conversion to Ninian (q. v.). A careful examination of the statements of Venerable Bede, and the fuller but less trustworthy narrative of Ailred of Rievaulx, will shew that the Southern P., converted by Ninian, had their seat north of the Forth; that they were, in fact, the great division of the Pictish nation occupying the country between the Firth and the Grampians. The labours of Ninian were carried on and completed by teachers whose names are well known to the readers of ecclesiastical history—Palladius, Serf, Ternan, and others. The Northern P. owed their conversion to a teacher of higher renown—St Columba (q. v.). The life of that abbot, from his leaving Ireland in 563, to his death in 597, was chiefly spent in converting the Northern Picts. Their ruler at this time was Brude, son of Maillon, whom Bede styles a very powerful king. His chief residence was on the banks of the Ness, and there Columba baffled and confuted the heathen Magi in the manner recorded by his biographer Adamnan. It is impossible to ascertain the precise character of the superstitions held by the P. before their conversion. Those whom Adamnan

calls Magi, are by some modern writers styled Druids, and their religion is said to have been a species of Druidism—whatever that may be held to mean.

Brude, the first Christian king of the P., died in 586. Catalogues are preserved, of more or less authority, of the sovereigns who succeeded him. It is impossible to reconcile the discrepancies of these lists, which probably contain the names of princes who reigned at the same time in the northern and southern divisions of the kingdom. The limits of the Pictish territories continued much the same till the middle of the 7th c., when a portion of the southern province was subdued by Oswy, king of Northumbria. In the beginning of the reign of Oswy's son and successor, Egfrid, the P. made an attempt to recover the territory which had been wrested from them. It was unsuccessful; and the power of the English was so firmly established, that the conquered province was erected into a diocese separate from Lindisfarne, the seat of the bishop being fixed at Abercorn. Encouraged by the success which had attended his enterprises, Egfrid seems to have contemplated the subjugation of the whole Pictish kingdom. He advanced northwards with his army; Brude, son of Bili, king of the P., retreating before him. The English sovereign passed the Tay, and the P. made a stand at Nechtansmere, supposed to be Dunnichen, in Angus. A conflict ensued; the English were utterly defeated, and their king was slain. The consequences of this battle, which was fought on the 20th of May 685, were very important. The P. recovered the whole territory which they had lost, and even subdued for a time a portion of the proper Northumbrian kingdom.

The next Pictish prince whose name calls for special notice is Nectan, son of Dereli, who succeeded about the year 710. He cultivated learning to some extent, and aspired to the position of an ecclesiastical reformer. The Pictish Church held precisely the same doctrines as the English; but it differed in various points of ritual, the most important of which related to the proper time of keeping Easter. The king applied for advice to Ceolfrid, Abbot of Jarrow, and the answer, which is addressed 'To the most Excellent Lord, and most Glorious King, Nectan,' is preserved among the works of Venerable Bede. Encouraged by this epistle, he summoned a council of his clergy and nobles, and enjoined them to observe the English usages. The royal command met with a ready obedience. He had also applied to the Abbot of Jarrow for architects to build a church of stone in the Roman fashion, which he proposed to dedicate to St Peter. We are told by Bede that the architects were sent, but have no further information on this interesting subject. The plans of the king were probably interrupted by dissensions among his people; and the entire assimilation of the ecclesiastical institutions of Northern Britain to those of England was postponed for four centuries.

The most active of all the Pictish sovereigns was Hungus, son of Urgust, who succeeded in 730, and reigned for thirty years. He was engaged in constant wars with the Scots, the Britons, and the English, in which he was generally victorious. After his death, the kingdom began to decline. The history of its latest period is involved in impenetrable obscurity; all that we know for certain is the final result. Various princes claimed the crown, and held possession of portions of the kingdom. But the most powerful competitor was Kenneth, son of Alpin, king of the Scots, who was descended, in the female line, from the ancient sovereigns of the P., and was probably the true inheritor, according

to the peculiar law of succession which is said to have existed among that nation. Kenneth was acknowledged as king in 843, and fixed his residence at Forteviot in Strathern, the capital of the Pictish kingdom.

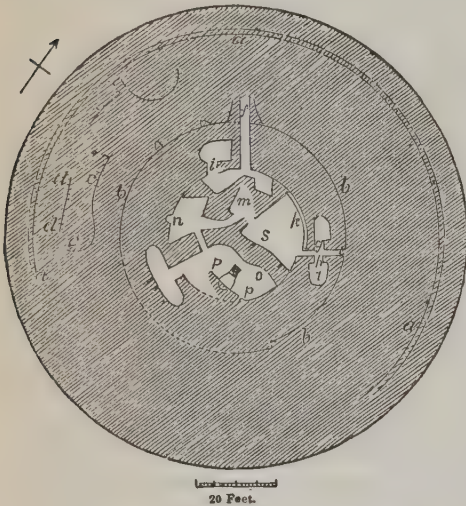

A famous passage from Henry of Huntingdon has often been quoted, in illustration of the supposed utter destruction of the P. of their princes, their race, and their language. It is referred to in that sense at the close of the following sentences of a work published a few years ago: 'The Pictish vessel is seen in the distant horizon; she approaches rapidly, till you clearly distinguish the crew upon the deck; but before you are near enough to hear their voices, she sinks, the waters close over her, and the wreck never can be raised. The total extinction of the Pictish language renders any further inquiry impossible. The acumen and criticism of the nineteenth century cannot advance beyond the homely wisdom of the twelfth century.'—Sir Francis Palgrave's *History of Normandy and of England* (4 vols., 1851—1864), vol. iv., p. 294.

The impression conveyed by such words is an erroneous one. The Pictish princes still continued to reign in the persons of Kenneth and his descendants. They were kings of the P. in reality and by race, as much as James I. and his successors were kings of England. The princes did not cease in the one case more than in the other to be sovereigns of the larger kingdom, because they had previously ruled in the lesser one. Neither did the nation of the P. cease to exist. They dwelt as before in their own land; their old capital was the capital of the new kingdom; and Pictavia is spoken of by the chronicles long after the accession of Kenneth, and long before Scotia became identified with Northern Britain, or ceased to be the ordinary name for Ireland. Undoubtedly, through the influence of the kings, and perhaps of the clergy, whom the later Pictish princes had held under an oppressive bondage, the Scots became the predominant race, and finally gave their name to the united kingdom and nation. Neither did the language of the P. cease to be spoken. It continued, as before, to be the dialect of the north-eastern provinces, till, first in the extreme north, it yielded to the Scandinavian invader, and afterwards—more than two centuries subsequently to the accession of Kenneth—it began to recede slowly before the Teutonic tongue of English and Flemish colonists. The same process which destroyed the Celtic language of the Pictish people, destroyed also the Celtic language of the British kingdom of Cumbria. There is no more reason to question the causes which overthrew the ancient dialect of Fife and Buchan, than there is to question those which subverted the old speech of Carrick and Clydesdale. If anything were wanting to refute completely the popular error in regard to the destruction of the Pictish language, it would be supplied by the recent discovery at Cambridge of a manuscript of the 11th or 12th c. (see DEER, OLD) which contains the Celtic record how Columba and Drostan came from Iona to Aberdour, and how Bede the Pict, who was then Maormor of Buchan, gave them the cities of Aberdour and Deer.

The chief ancient authorities for the history of the P. are Adamnan's *Life of St Columba*, edited by Dr Reeves; the *Ecclesiastical History* of Venerable Bede; the *Life of St Ninian*, by Ailred of Rievaulx, in Pinkerton's *Ancient Lives of Scottish Saints*; the Pictish Chronicle, in the appendix to Innes's *Critical Essay on the Ancient Inhabitants of Scotland*, and in the appendix to Pinkerton's *Inquiry into the History of Scotland*; and

the *Irish Annals*, edited by O'Connor. The best modern works on the subject are Innes's *Critical Essay*, and his *Civil and Ecclesiastical History of Scotland*; Pinkerton's *Inquiry*; Chalmers's *Caledonia*, vol. i.; Ritson's *Annals of the Caledonians, Picts, and Scots*; Mr Grub's *Ecclesiastical History of Scotland*, vol. i.; and a dissertation 'On the Probable Relations of the Picts and Gael with the other Tribes of Great Britain' in Garnett's *Philological Essays*, pp. 196—204.

PICTS' HOUSES, the name popularly given in many parts of Scotland to the rude underground buildings, more commonly and accurately called **EARTH-HOUSES** (q. v.). The name is often given also to a more advanced class of buildings of the same kind, found in the more northern counties of Scotland. The ground-plan of one of these at Kettleburn, in Caithness, explored and described by the late Mr A. H. Rhind, of Sibster, is figured in the accompanying woodcut. The outmost circle

Pict's House at Kettleburn, Ground-plan.

represents the extreme limits of the mound which covered the structure; *a*, a bounding wall, three feet thick, and three feet high, rudely built of large unshaped stones; *b*, an inner wall, four or five feet high; *c* and *d*, fragments of walls faced outwards; *e* and *f*, passages leading to the inner chambers; *g*, *h*, and *i*, passages leading to smaller side chambers; *k*, a wall within the wall of the chamber *s*; *m*, a chamber, so ruined that its walls could not be traced all round; *n*, a large boulder, which, being difficult to remove, had been built over; *o*, a chamber containing a regularly built well (between *p* and *p*), nine feet deep, and roofed over. The whole walls were built without mortar. The objects found within them were remains of animals and shell-fish, fragments of pottery, and implements of stone, bone, horn, bronze and iron. The name of Picts' Houses is also occasionally given in the north of Scotland to rude stone structures above ground.

PICTURES are now protected in the United States and Great Britain in a manner similar to books the copyright of which belongs to some individual. By the act of Congress, July 8, 1870, a printed copy of the title of the book, map, chart, musical composition, engraving, cut, print, photograph, chromo, or a description of any design for a work of the fine arts, for which a copyright is desired, inclosing one dollar for each certificate of copyright, must be sent by mail to the Librarian of

Congress, Washington, D. C., before the publication of the article. Within ten days after the publication of such article, two complete copies of the best edition issued must be mailed, to perfect the copyright, to the Librarian of Congress. If specimens are not thus deposited, the copyright is void, and a penalty of \$25 is incurred. Copyrights recorded prior to July 8, 1870, in the office of the Clerk of any District Court, do not require re-entry at Washington. But one copy of each book or other article published since the act of March 4, 1865, is required to be deposited in the Library of Congress, if not already done, or the copyright becomes void.

To render copyrights hereafter issued valid, the article copyrighted must contain an inscription thereon certifying that it has been *Entered according to Act of Congress in the year —, by —, in the office of the Librarian of Congress, at Washington*. A penalty of \$100 will be imposed upon any one who uses this notice, not having obtained a copyright. If an author desires to reserve the right to translate or dramatize his work, he must give such notice by printing the words *Right of translation reserved, or All rights reserved*, below the notice of the copyright entry, and notifying the Librarian of Congress of such reservation, to be entered upon the record. Each copyright secures the exclusive right of publishing the book or article for the term of 28 years, and the author or designer, if owner, or heir of the owner, may obtain a renewal for 14 years longer.

PICUS and **PICIDÆ**. See **WOODPECKER**.

PIEDMONT, or **PIEMONT** (Fr. *pieù*, foot, *mont*, mountain), an Italian principality, which now forms the north-west part of the kingdom of Italy, is enclosed mostly by natural boundaries, having on the N. the Pennine Alps, on the W. the Graian and Cottian Alps, on the S. the Maritime Alps and Genoa, and on the E. the Ticino and the duchy of Parma. It includes the former duchy of Montferrat (q. v.), which lies in its south-eastern corner, and the Sardinian portion of the old duchy of Milan, and contains 11,777 English square miles, with a population (1871) of 2,834,155. The mountain ranges which form its boundary on the north, west, and south, attain, in various places, a great elevation above the sea; the Col de Tende, Monte Viso, Mont Cenis, Mont Iseran, Mont Blanc, Mont St Bernard, Mont Cervin, Monte Rosa, and the Simplon, being all on the boundary-line. As to its general character, the country is partly mountainous, partly hilly, and much diversified with hill and dale; the ranges which traverse the country being spurs from the alpine boundary, and converging towards the central tract, through which flow the Po and its chief tributary the Tanaro. The valleys which separate these ranges are all watered by rivers which take their rise in the Alps, and pour their supplies into either the Po or the Tanaro, according as they come from the north and west, or from the south. The amount of the water-supply in the country may be imagined when it is considered that in P. the Po receives no fewer than 10 tributaries on the left, and 6 on the right, all of them of considerable size, and some of them, as the Tanaro and Dora Baltea, worthy of being classed as rivers. The valleys of the Po and Tanaro are exceedingly rich and fertile, producing abundant crops of grain, pulse, hemp, chestnuts, olives, and many kinds of fruit. Maize and barley are the chief cereals, the former being the ordinary article of food to the inhabitants, while abundant herds of swine are fed upon the latter. The climate is mild in winter; but in summer, especially on the level country east of the Dora Baltea and the Tanaro, the heat is scorching, and this portion would be

rendered a perfect sandy desert, were it not for the complete system of irrigation, which supplies moisture to more than half a million of acres, and renders the eastern districts the granary of the country. So valuable is the privilege of using the water of rivers as a means of irrigation, that a considerable tax is levied upon it. The other products of P. are wine and silk, which are produced in great abundance, especially silk, which is the best in Italy, and is generally exported raw. The chief manufactures are silk, linen, woollen, and cotton goods, hosiery, paper, leather, cutlery, various fermented liquors, glass, and iron. The inhabitants are active and industrious, and mostly belong to the Roman Catholic religion, but are more tolerant than in other parts of Italy. The Vaudois or Waldenses (q. v.), have from time immemorial inhabited the wild vales at the foot of the Cottian Alps, in the western corner of the principality. Many of the Piedmontese, like the Swiss and Tyrolese, spend their youth and early manhood in travelling through other countries as dealers in engravings, jewellery, and other articles of merchandise, and returning with a small hoard to spend the rest of their days in comfort in their native land.

P., in the 10th c., was possessed by the marquises of Susa, Ivrea, Montferrat, and Saluzzo; and it was not till when, a century afterwards, the marquise of Susa passed into the House of Savoy, that the latter, then counts of the Maurienne (the south portion of Savoy), gained a footing in the country. At the commencement of the 12th c., the possessions of the House of Savoy were divided, and the lines of Savoy and P. formed; but they were again united, in 1416, by Amadeus VIII. (afterwards Pope Felix V.), who, in the following year, obtained from the Emperor Sigismund the title of Duke of Savoy, which they exchanged for that of king in 1684. During the Spanish War of Succession, P. was increased by the addition of the provinces of Alessandria, Valence, Lomellino, and the Val di Sesia (1703), by Tortona and Novara in 1735—1736, and by Vigevanese and Bobbio in 1743. In 1796, it was seized by the French, and parcelled out into six departments, five being incorporated with France, and one with the kingdom of Italy; but after the fall of Napoleon, the House of Savoy recovered possession of it. See ITALY, SARDINIA, SAVOY. Since 1860, the name P., as a provincial designation, has been disused; and in the new division of Italy into provinces, the boundaries of P. as a distinct country have been disregarded.

PIEPOWDER COURT, in England, an ancient court held in fairs and markets to administer justice in a rough and ready way to all comers, called also the Court of Dusty Foot (Fr. *pieu poudreux*). Its jurisdiction seems to have been confined mostly to petty vagabonds, pedlers, and other wanderers. The court has long been obsolete, the only jurisdiction of that kind being now merged in the court of Petty Sessions (q. v.).

PIER, the block of solid wall between doors, windows, &c.; also a solid mass of masonry built to receive the arch of a bridge. The term is also used synonymously for the Pillars (q. v.) of a church; thus, we speak of nave-piers, &c.

PIERCE, FRANKLIN, the fourteenth President of the U.S. of America, was born in Hillsborough, New Hampshire, November 23, 1804. His father, General Benjamin Pierce, was a soldier of the war of independence, and governor of New Hampshire. Franklin P. was educated at Bowdoin College, Maine, and was an officer in a college military company, in which his biographer, Nathaniel Hawthorne, was a private. He spent his first vacation in teaching a

country school, studied law with Levi Woodbury, governor and senator, was admitted to the bar in 1827, became Speaker of the State House of Representatives in 1829, and was elected to the 33d congress, a democrat of the school of Jackson. In 1837, he was elected to the U.S. senate, of which he was the youngest member. He declined the office of Attorney-general, offered him by President Polk, and refused the nomination for governor of New Hampshire; and at the commencement of the Mexican war, volunteered as a private, but was appointed brigadier-general, and led his brigade in the battles of Contreras and Churubusco. In 1852, in consequence of the conflicting claims of the leaders of the Democratic party at the Baltimore Convention, he was nominated as a compromise candidate for the presidency, against General Scott, the Whig nominee, and received the votes of all but four states. He appointed an able cabinet, including Jefferson Davis as Secretary of War. During his administration, the Missouri Compromise was repealed; the treaty for reciprocity of trade with the British American colonies was made, and a treaty with Japan; and the Kansas difficulties which then arose, with the growing animosity between the North and South, led to secession, and the war of 1861. At the close of his term of office in 1857, he travelled in Europe, and, having no sympathy with the party which subsequently came into power, took no part in politics. His biography was written in 1852, by his friend and classmate, Hawthorne, whom he appointed U. S. consul at Liverpool. Mr P. was a man of moderate ability, and owed his advancement more to amiable personal qualities than to statesmanship. He died on October 8, 1869.

PIERCED, in Heraldry, a term used to indicate that a charge is perforated so as to shew the field beneath it. The aperture is presumed to be circular, unless some other form, as square-pierced or lozenge-pierced, be specified in the blazon.

PIERRE, JACQUES HENRI, BERNARDIN DE ST, a celebrated French writer, was born at Havre, 19th January 1737. He received his education at Caen and Rouen, and afterwards entered the government department of civil engineers. On his dismissal from this service in 1761, he wandered about the continent for several years, endeavouring to realise his dream of a republican colony. His adventures at St Petersburg, Moscow, Warsaw, and Dresden shew what an utter simpleton and sentimentalist P. was in his ideas of life. He returned to France in 1766, and soon after obtained a commission as engineer for the Mauritius, but parted from his companions; and after a residence of three years in the island, he returned to Paris, where he made many literary acquaintances. At this time, he wrote the story of *Paul et Virginie*, while his remembrance of tropical scenery was still fresh. The little book, with its passion, its simplicity, its tenderness, achieved an immense success, and has been translated into almost every language. St P. passed through the storms of the Revolution in safety, and was lucky enough to secure the patronage of Napoleon. From the Emperor, he received the legion of honour and a pension. He died at Erangy-sur-Oise, 21st January 1814. Besides *Paul et Virginie*, he wrote *La Chaumière Indienne* ('The Indian Cottage'), essays, a narrative of his journey to the Mauritius, and several plays. His *Œuvres Complètes*, preceded by a life of the author, have been edited by M. Aimé-Martin (12 vols., 1818—1820).

PIETÀ (an Italian word signifying *piety*, in the sense in which that term indicates or includes affection for relatives), the name given in the language of art to representations of the Virgin Mary

embracing the dead body of her son. It is a counterpart to the *Madonna* with the infant Jesus in her arms. The one affords an opportunity for the representation of the purest joy and highest motherly love; the other, of the utmost pain and grief. The *pietà* has long been a favourite subject, not only with painters, but with sculptors. A famous one by Michael Angelo is in the Church of St Peter at Rome.

PIETISTS, a designation given since the end of the 17th c. to a religious party in Germany, which, without forming a separate sect, is distinguished not only by certain peculiarities of religious opinion, but also by the manner in which these are manifested. The peculiar character of their religion is very generally denoted by the term *pietism*, which is frequently employed with reference to the same tendencies of opinion, feeling and conduct, where-soever and whensoever exhibited. Pietism may be regarded as consisting in an exaltation of the importance of religious feeling, and of the practical part of religion, with a corresponding depreciation of doctrinal differences, and a contempt for outward ecclesiastical arrangements; and has been more or less strongly developed from time to time in all sections of the church, a tendency towards it always existing in a large class of earnestly religious minds. In the church of the middle ages, this tendency was displayed in an endeavour to attain to a superior spirituality and purity by means of religious contemplation and asceticism, and many, consequently, embraced a monastic life. The Reformers, adopting the Augustinian doctrines, rejected this mode of seeking deliverance from indwelling sin, and proclaimed the efficacy of faith in the sacrifice of Christ. But the controversies which arose among them, and increased among their successors, gradually gave a too exclusively doctrinal and polemical character to the sermons and writings both of the Lutheran and Calvinistic divines, particularly in Germany, and a reaction ensued, not in favour of the Church of Rome, but in favour of a religion of feeling and good works, or of the heart and life. Disgust at the sectarian bitterness and exclusiveness which prevailed, led even to an undervaluing of disputed points; and thus the *Pietism* of Germany was generated and developed. The origin of it is referred to a work entitled *Vom wahren Christenthume*, by John Arnd, published in 1605; to the *Invitatio Fraternalitatis Christi* of John Val. Andreae, published in 1617, both of them Lutherans; and to the writings of Cocceius, a Calvinist. But its fuller development is unquestionably to be ascribed to Spener (q. v.), in the latter part of the 17th c., and to his friends and disciples. The name *Pietists* was first given in contempt to certain young *docents* in Leipzig, who began in 1689 to give prelections on the New Testament both to students and citizens, and to addict themselves much to a meditative mode of life. Spener had held meetings of a somewhat similar kind in his own house when preacher at Frankfurt-on-the-Maine, and in his writings had urged the necessity of a reform in the Protestant church and theology. He and his followers dwelt much upon the importance of studying the Scriptures rather than the symbolical books, upon the unfitness of any unconverted or unregenerate person for the office of the ministry, upon the right and duty of the laity to take part in the exercises of Christian assemblies, and upon the necessity of a practical rather than a systematic religion. But many of the more extreme Pietists carried their antipathy to the doctrinalism and the established services of the church to a degree that alarmed the theologians of the old school, the high and dry Lutherans, or German 'moderates,' who accused

Spener and his disciples, not without reason, of a tendency to make all goodness and virtue consist in mere religious feeling, or pious sentimentalism; to represent the divine grace as operating in too sudden and abrupt a manner; to exaggerate the value of good works; to depreciate the value of learning and of clear intellectual perception in the study of Scripture; and to indulge in a strictness of judgment upon the religious character of the ordained clergy, tending to sectarianism, and indeed incompatible with ecclesiastical unity. The weapons of argument, however, were not the only weapons employed against them. The docents were compelled to give up their prelections, and finally to leave Leipzig; the meetings for mutual edification were suppressed by the government as disorderly conventicles; and Francke (q. v.), the most distinguished of the Leipzig docents, having gone to Erfurt, was prevented from lecturing, and quickly compelled to retire. Spener's influence, however, procured a refuge for his friends in the newly founded university of Halle, and Francke obtained a professorship there. Halle became thenceforth the source of new religious influences, and, indeed, of a new religious life to Germany. The Pietists, although spiritually exclusive—disposed to regard themselves as the 'chosen of God,' and to look down on all others as 'children of the world,' or even of the devil—did not attempt to form a separate sect. To do them justice, they were as far as possible from being ecclesiastically ambitious; all their desire was to excel in 'labours of love,' and to cultivate feelings of intensest piety. The rise of the Wolfian or Rationalistic theology, the spread of that sort of sceptical anti-clerical philosophy which flourished for a while under the name of *Aufklärung* (Enlightenment), exercised an injurious and depressing influence on Pietism; yet through all the long obstinate warfare maintained against the doctrines of the church by the Rationalists during the last half of the 18th, and the most part of the 19th c., Pietism continued to number some adherents; and it can hardly be doubted that it is to the Pietists, and not to the Lutheran dogmatists, that Germany is in a great measure indebted for that revival of religious faith and feeling which, begun with the great Schleiermacher—himself trained up under pietistic influences—has since widely diffused itself through her biblical scholars and theologians. The patriotic enthusiasm called forth by the insolent conquests of the French, naturally allied itself to pietistic tendencies, for in Germany, the triumphs of Napoleon even as emperor were looked upon as the triumphs of revolutionary, republican, and infidel principles; and after the general restoration of peace, the statesmen and upper classes, especially in Prussia, believing that political security could only be obtained by a return of the populace to the simple, obedient, and unquestioning piety of earlier times, countenanced this party in the church; and amiable tea-drinking societies of devout men and women were formed to distribute tracts, and to inoculate the radical and heathen masses with pietistic sentiments. But this attempt to use 'piety' for reactionary political purposes sullied its purity, and alienated from it the very parties whom it wished to influence. Still, however, Pietism exists as a distinct element in the religious life of Germany, and now, as ever, its strongholds are Prussia (Berlin, Silesia, Wupperthal), Hesse, and Würtemberg.

PIETRA-DURA, a name given to the finest kinds of Florentine mosaic-work, in which the inlaid materials are hard stones, such as jasper, carnelian, amethyst, agate, &c. The real *pietra-dura* work dates as far back as the 16th c.

about 1570; and from that time to the present, has been almost confined to Florence, where a government *atelier* has existed ever since the beginning of the 17th c., which was originated in order to supply decorations for the Capella Medicea. It is sometimes called *Pietre Commesse*, and *Lavoro di Commessio*. In the inferior kinds, which are sold in Italy, and are manufactured now pretty extensively in Derbyshire and other parts of Britain, pieces of coloured sea-shells are used instead of the harder and more valuable coloured stones.

PIEZOMETER (Gr. *piezo*, I press; *metron*, a measure), an instrument for measuring the compressibility of fluids. Oersted's (q. v.) instrument, the first by which the compressibility of water was satisfactorily determined, consisted of a cylindrical glass jar, into the neck of which a narrower cylindrical tube of glass, open at both ends, was firmly fixed. In this tube worked an air-tight piston by means of a screw. In the interior of the jar was placed a bottle, whose neck was drawn out into a long capillary graduated tube, and alongside this bottle was suspended a cylindrical tube, closed at the top, but open at the bottom. When the compressibility of any liquid was to be determined, the instrument was adjusted in the following manner: the bottle inside was filled almost to the top of the capillary tube with the fluid, and being replaced inside the jar, the latter was completely filled with water up to the piston in the neck. The liquid in the submerged bottle, then under pressure of the water above it, fell slightly in the capillary tube, being kept from contact with the water by an air-bubble, the motion of which up or down, according as the pressure was less or greater, served as an index for reading off the graduation. The suspended tube alongside being at first only filled with air, the water rose in it to some extent, and by graduations on the tube it was made to indicate the pressure in atmospheres or parts of atmospheres. Pressure was now applied to the water in the jar by screwing down the piston; the compressed water communicated the pressure to the liquid in the bottle and to the air in the suspended tube; the descent of the air-bubble in the former indicating the amount of diminution in bulk the liquid had undergone (the capillary tube being graduated in inches and parts of inches, and each inch of tube being known to contain a certain fraction of the contents of the bottle), while the ascent of the water in the suspended tube shewed the amount of pressure which had been applied.

PIG. See Hog.

PIGEON (Ital. *piccione*, *piccione*, or *pipione*, from *pipiare*, Lat. *pipire*, to peep or cheep), a name sometimes applied, like Dove (q. v.), to all the species of *Columbidae* (q. v.), and sometimes almost restricted to those still included by ornithologists in the genus *Columba*; having a bill of moderate length, hard, and a little arched at the point, the base of the upper mandible covered with a soft thick skin, in which the nostrils are pierced; the feet with toes divided to the base, and formed both for walking and perching; the wings rather large and pointed; the tail of moderate length, and generally square at the end. The species of this group are numerous, and occur in almost all parts of the world. Some of them build their nests in trees, and some in holes of rocks; they lay only two eggs at a time, but breed twice or oftener in a year, and both the male and the female take part in incubation. The original of all the varieties of the DOMESTIC P. is now almost universally believed to be the ROCK P. or ROCK DOVE (*C. livia*), the *Biset* of the French, a bird of extensive geographical range, being found as

far north as the Farøe Islands, and on many parts of the coasts of Europe, Asia as far as Japan, and the north of Africa, breeding in crevices of rocks, and often within caverns which open on the sea. It swarms in prodigious numbers in some of the rocky islands of the Mediterranean; and even on the British coasts, great numbers are found in some localities, particularly in the Orkneys and Hebrides. Its food consists partly of molluscs and other small animals, partly of grain and seeds; and it often makes unwelcome visits to the corn-fields of its vicinity. In a wild state, this bird exhibits great uniformity both of size and plumage; being not quite twelve inches in length from the tip of the bill to the end of the tail; the prevailing colour bluish-gray, in some parts with green and purple reflections, two broad and distinct bars of black across the closed wings; the lower part of the back white; the tail deep gray, with a broad black bar at the end; the bill blackish-brown; the legs and toes reddish-orange.—Until recently, naturalists very generally confounded this species with the STOCK DOVE or SMALLER WOOD P. (*C. oenas*), a species which inhabits woods, and generally builds in trees, preferring the hollows of old decaying trees, or the tops of such as have been pollarded and have become bushy—whence the name *Stock Dove*. In some of the open parts of England, however, it makes its nest in rabbits' burrows or other holes in the ground. It is rather larger than the Rock P.; its prevailing colour is bluish gray, in some parts passing into pale gray, but nowhere into white; the wings destitute of bands; the sides of the neck with green reflections; the breast purplish red. It congregates in large flocks in autumn and winter. It is partially migratory in some parts of Europe; a summer visitant of the northern regions. In Britain, it is found only in the southern parts of

1, Ring Dove, Cushat, or Wood-pigeon; 2, Biset, or Wild Rock Pigeon; 3, Collared Turtle.

the island. Its geographical range includes great parts of Europe and Asia, and the north of Africa. It feeds on beech-mast, acorns, grain, pulse, &c., and sometimes resorts to turnip-fields to eat the tender tops. Its voice is very different both from that of the Rock Dove and that of the Ring Dove.

Its flesh is of very fine flavour.—The RING DOVE, WOOD P., or CUSHAT (*C. palumbus*), is the most common British species, and is diffused over great part of Europe, either as a permanent resident or a summer bird of passage, although it is not found at all in some of the most northern regions; and occurs also in the temperate parts of Asia, and the north of Africa. Its soft loud *coo* is one of the pleasant intimations of approaching spring. It inhabits woods, and builds its nest among the branches of trees. It is the largest of the British species, being about seventeen inches in entire length. It feeds on green corn, young clover, turnip-tops, grain, pulse, acorns, &c. Where it abounds, its voracity is often very injurious to the farmer. It is gregarious in winter. It is in considerable estimation as an article of food; but it is very shy and wary, not easily approached by an inexperienced sportsman.—These are all the British species of pigeon. Our limits quite preclude us from noticing almost any other. The RING-TAIL P. (*C. Caribbea*) may be mentioned as a West Indian species, much valued for the richness and delicacy of its flesh, which is reckoned one of the greatest luxuries of that part of the world. The BALD-PATE or WHITE-HEADED P. (*C. leucocephala*) is another large and fine species, plentiful in the West Indies. It migrates to the *Keys* of Florida in summer.—The DOUBLE-CRESTED P. (*C. dilopha*) is a large species, inhabiting the north of Australia and warmer regions to the northward, remarkable for its crest, which consists of two parts, one on the back of the head, and another of lax recurved feathers springing from the forehead, and even from the base of the bill.

Only one species of P. has been truly domesticated, and having long been so, it has undergone many remarkable changes, and there are numerous varieties or breeds; some of them, exhibiting very strange peculiarities, and known as *fancy pigeons*, being carefully preserved and tended by pigeon-fanciers. Pigeon-fancying is nowhere carried further than in London, where there are many persons who give great part of their time to it, and whose pigeons are their chief delight. The prices of such fancy pigeons as are deemed most perfect of their kind, are very high. The ordinary domestic pigeons, kept for profit as a kind of poultry, differ from the wild rock dove chiefly in colour, in which they are often very unlike it, although a tendency always manifests itself to return to the original colours, and the bars on the wings are apt to reappear in the progeny even of what may be called the most artificial varieties. Of these may be mentioned, as among the most interesting, the Rough-footed P., having the feet feathered; the Jacobin, which has a range of feathers inverted over the head, and extending down each side of the neck, as a hood; the Fan-tail, or Fan-tailed Shaker, in which the number of the tail-feathers is greatly increased, and the bird has the power of erecting its tail like that of a turkey-cock, whilst it has also a peculiar vibratory motion; the Tumbler, so called from tumbling in the air in its flight, and further characterised by a very short bill; and the Pouter or Cropper, which has the power of blowing up its crop to an extraordinary degree, so that the head seems fastened on the top of an inflated bladder. The Carrier P. (q. v.) is regarded as a variety of the Common Pigeon.

The law regarding pigeons is stated in the article DOVECOT. For the profitable keeping of pigeons, it is necessary to have a properly-constructed dovecot, divided into cells, a cell for each pair, each cell sixteen inches broad, by twelve from front to back, and the door towards one side, so that the nest may not be seen from without; a slip of wood in front

of each cell for the birds to sit and coo on. The dovecot must be placed at such a height as to be out of the way of rats and other depredators; and must be frequently cleansed, otherwise it may probably be deserted by its occupants. It ought to be painted white, that colour being very attractive to pigeons, and contributing to retain them when a new dovecot is established, in which there is often found to be not a little difficulty. Pigeons begin to breed at the age of nine months, and breed every month except in very cold weather. The male and female continue faithful to each other from year to year, a circumstance noted by Pliny and others of the ancients, and evidently, as well as their somewhat demonstratively manifested affection, a reason of the poetic references often made to the dove.

PIGEON PEA (*Cajanus*), a genus of plants of the natural order *Leguminosæ*, suborder *Papilionaceæ*, of which, according to some botanists, there is only one species (*C. flavus*), a native of the East Indies, but much cultivated also in the West Indies and in Africa; according to others, there are two species, *C. flavus*, with flowers entirely yellow, the pod marbled with dark streaks, and two or three seeds in each pod; and *C. bicolor*, called CONGO PEA in the West Indies, the pulse of which is much coarser, and is used chiefly by negroes. The finer kind is nearly equal to the Common Pea. This kind of pulse is very much used in tropical countries. The plant is a shrub (*Cytisus cajan* of Linnæus) about eighteen inches high. It is half-hardy in the south of England. In tropical countries, the plants stand and are productive for several years. They throw off their leaves annually, and reproduce them along with their flowers. The P. P. is one of the most valuable of the tropical kinds of pulse. It grows either on rich or poor soils. It is called *Doll* and *Urthur* in the East Indies. The name P. P. is West Indian.

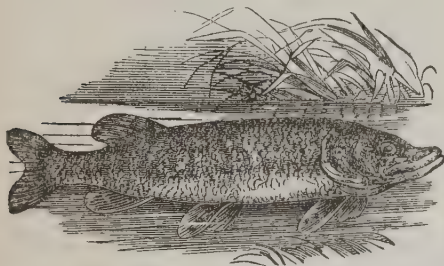

PIGMENTS. See PAINTS.

PIKE, PIKEMAN. Previously to the use of the bayonet, infantry of the line of battle—that is, the heavy-armed troops—were from the earliest times armed with pikes or spears. The Macedonians carried pikes 24 feet long; those of modern warfare averaged 12 or 14 feet. They were of stout wood, and tipped with a flat iron spearhead, which sometimes had cutting edges. As a defence against cavalry, the pike, from its length and rigidity, was of great value; but though it long survived the introduction of gunpowder, that event was really fatal to it. For success with the pike, especially in offensive war, a depth of several men was essential, and this depth rendered the fire of artillery peculiarly fatal. The pike is now superseded by the bayonet on the end of the musket.

PIKE (*Esox*), a genus of Malacopterous fishes, including all the species of the family *Esocida*, as restricted by Müller, and characterised by an elongated body, covered with scales, a depressed head, and broad blunt muzzle, with very large mouth, abundantly furnished with teeth of various sizes on the jaws, palatine bones, and vomer; no adipose fin; and the dorsal fin placed very far back over the anal fin. The species are not numerous; they are all inhabitants of fresh waters. Several are found in N. America. The COMMON P. (*E. lucius*) is a native both of Asia and N. America. It is very generally diffused over Europe, and is abundant even in its most northern regions; it is now common in lakes, ponds, and slow rivers in all parts of the British Islands, although it is supposed not to be truly indigenous to them. The statement has often been made that it was introduced during the reign of Henry VIII.; but there is evidence of

its existence in England at a much earlier date. It was certainly known as early as the reign of Edward I., who, graciously regulating the price of commodities for his subjects, fixed that of the pike higher than that of the salmon, and ten times higher than that of the turbot and the cod, from which we may perhaps infer its comparative rarity at that period. Some of the waters in the fenny districts of England are peculiarly adapted to pike, which are there found in very great quantity, and of superior quality.

The P. is of a dusky olive-brown colour on the upper parts, becoming lighter and mottled with green and yellow on the sides, and passing into silvery white on the belly; the fins brown; the larger fins mottled with white, yellow, and dark green. The tail-fin is forked. The P. grows to a large size, occasionally attaining a weight of sixty or seventy pounds, although the stories of pikes much larger than this are liable to suspicion. The excessive voracity of the P. has long been proverbial. No animal substance which it can swallow, and which is capable of being digested, seems to be unpalatable to it; and no animal large enough to attract its attention, and which it can master, escapes being devoured. Mr Jesse mentions an instance of eight pike, of about five pounds' weight each, consuming nearly 800 gudgeons in three weeks; and one of them devoured four roach, each about four inches in length, in rapid succession, and seized the fifth, but kept it in his mouth for about a quarter of an hour before

Pike, or Jack (*Esox lucius*).

swallowing it. The P. readily attacks a fish of its own size, and preys freely on the smaller of its own species. Frogs are frequent prey; water-rats and ducklings are sometimes devoured. A large P. often takes possession of a particular hole in the bank of a river, from which it issues to seize any creature that may pass.—The P. spawns in the beginning of spring, for that purpose ascending narrow creeks and ditches, in which it is very easily caught by nets. Large quantities are caught at the spawning season in Lapland, and dried for future use. The P. grows very rapidly when the supply of food is abundant, reaching a length of 8 to 10 inches in its first year, 12 to 14 in the second, 18 to 20 in the third, and afterwards increasing for a number of years at the rate of about four pounds every year. A young P. is sometimes called a *Jack* or *Pickrel*. The name *Luce* (Lat. *lucius*) is still known as an English name of the pike. The Scotch name is *Geddi*, a name similar to those in the Scandinavian languages.

The flesh of the P. is much esteemed, but that of pikes of moderate size is reckoned superior to that of small, or of very large ones.

The P. is not only caught by means of nets, but by the rod, by set lines, and by *trimmers* or *liggers*, which may be briefly described as floats with lines

attached to them, the line being so fastened that the bait swims at a proper depth, and that some yards of line run out when the bait is taken. The floats are sometimes made of wood or cork, sometimes of bundles of rushes, sometimes of bottles. In angling for P., various baits are used, such as a minnow, par, or other small fish, a portion of a fish, &c., and sometimes an artificial fly is employed with great success, made of two large hooks tied together, and adorned with two *moons* from a peacock's tail. The angler unaccustomed to the P. must be cautioned as to the manner of the taking the hook from its mouth, as any rashness may lead to severe laceration of his hand by its teeth. P. may be fished any time from May to February inclusive, except when it is actually freezing. The best month is considered to be

Pike Spinner.

November; the P. are then in the best condition. One of the most approved tackles for angling for the P. is the *Spinner*, baited with a small dace, bleak, gudgeon, or par of about two ounces, as represented in the fig. The mode of using it is thus described in Bailey's *Angler's Instructor* (Longman & Co. 1857): 'Having cast your bait as far as possible, allow it, if you are fishing in a pond, or lake, or deep water, to sink a little, say two feet, then wind away at a brisk rate, holding your rod on one side rather low; if no run, wind out and throw again but this time wind brisk four or five yards, then all of a sudden stop a moment, then off again, doing so three or four times in one cast. I have often found this a good plan. If you still have no run try another throw and wind brisk as before, but occasionally giving your rod a sharp but short twitch.' See also Otter's *Modern Angler* (Alfred and Son, London).

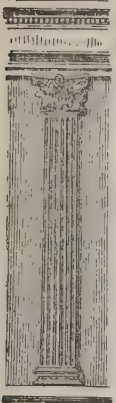

The largest species of Pike is the *Muskelonge*, which lives in the waters of the great lakes and St Lawrence. It occasionally reaches 60 lb. weight, and is an important article of food. The *E. reticularis*, which is marked with a network of brownish lines, is the common Pike of the middle and eastern states.

The Gar-fish (q. v.) is sometimes called the Sea Pike. The same name is also given to certain large voracious fishes of warm seas, belonging to the perch family.—The Saury P. is noticed in a separate article.

PIKE-PERCH (*Stizostedion*), a genus of fishes of the perch family, having two dorsal fins, of which the first has strong spiny rays, but resembling the pike in its elongated form, large mouth, and formidable teeth. The muzzle is not, however, broad and depressed, as in the pike. Several species are known, of which one (*S. Americana*), of a greenish-yellow colour, is found in the lakes and rivers of North America. It is a valuable food-fish, and extends as far east as Pennsylvania. Greatest weight 35 lb. The *S. salmoneum* is a handsome fish, of smaller size, from the Ohio. The *S. sandra* is common in the Danube, and in most of the rivers and lakes of the north-east of Europe, extending westward to the Oder and the Elbe, although not found in Italy, France, or Britain. It is highly esteemed for the table. Salted and smoked, it is a considerable article of trade in some parts of Europe. It is a fish of rapid growth, and attains a weight of 25 or 30 pounds. This fish readily takes the minnow and the artificial fly.

PIKE'S PEAK, a peak of the Rocky Mountains, in El Paso Co., Colorado, lat. 39° N., long. 105° W., about 10 miles W. of Colorado Springs. Its elevation has been determined to be 14,147 feet. It commands a view, of 200 miles' radius, of a rugged, mountainous country, containing many lakes and the sources of four great rivers—the Platte, Arkansas, Rio Grande, and Colorado of California. In 1858 large deposits of gold were discovered in this region; and during the first four years after the discovery there were shipped hence more than \$30,000,000. It abounds in rich gold-bearing quartz. The mining country is 5000 feet above the sea, with a dry climate, having a rainy season of only seven weeks. The top of Pike's Peak is covered with perpetual snow. It was named in honor of Gen. Z. M. Pike, who discovered it in 1806.

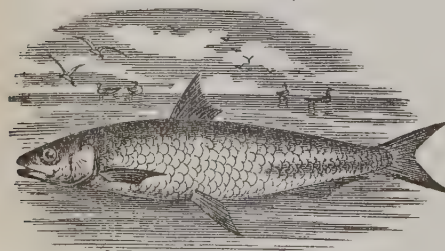

PILASTER, in Classical Architecture, a square pillar, sometimes standing free, but usually attached to a wall, from which it projects $\frac{1}{4}$ th, $\frac{1}{2}$ th, or other definite proportion of its breadth. Greek pilasters, or antæ, were of the same breadth from top to bottom, and had different capitals and bases from those of the orders with which they were associated. The Romans gave them a taper like the columns, and the same capitals and bases.

Pilaster.

PILAU, or PILAW, a dish common in India, Turkey, Egypt, and Syria, consists generally of rice, but occasionally some animal food is added. It is sometimes seen at tables in this country, prepared for those who have been accustomed to it abroad. The correct method of preparing it is to boil the rice for twenty minutes, with sufficient water to soak it thoroughly, and swell the grains to their utmost, taking care not to break them by making them too soft; it is then drained, and gently stirred with butter, pepper, and finely-chopped onions, and served up. This is the way in which the pilaws of the poorer classes are prepared; but for the tables of the more wealthy, fowls, lamb, mutton, shreds of ham or bacon, variously cooked, but always much boiled or roasted, are placed on the top of the rice, and served up with it. In India, very numerous and elaborate receipts are in use.

PILCHARD (*Clupea pilchardus*, or *Alausa pilchardus*), an important fish of the family *Clupeidae* (q. v.), referred by some naturalists to the same genus with the Herring (*Clupea*), and by others to the same genus with the Shad (*Alausa*). The P. is

Pilchard (*Clupea pilchardus*).

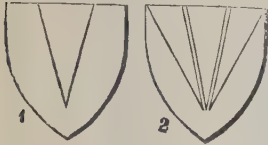

nearly equal in size to the herring, but rather thicker, and the lines of the back and belly are straighter; the scales are also larger and fewer; and the dorsal fin is rather further forward. The mouth is small, and in the adult fish destitute of

teeth; the under jaw longer than the upper. The upper part of the body is bluish-green; the sides and belly silvery white; the cheeks and gill-covers tinged with golden yellow, and marked with radiating striæ; the dorsal fin and tail dusky. The P. is an inhabitant of more southern seas than the herring, being nowhere plentiful on the British coasts, except in the extreme south, and chiefly on the coasts of Devonshire and Cornwall; whilst it occurs on many parts of the Atlantic coasts of France and Spain, and on the coasts of Portugal, and is found in the Mediterranean Sea. Like the herring, it was formerly supposed to be a migratory fish, annually visiting the coasts of England and other countries; but, as in the case of the herring, this opinion has now been relinquished; and the shoals of pilchards which are seen on the coasts are believed merely to issue from deeper waters near at hand, for the purpose of spawning. The spawning season of the P. begins early in summer; but on the coasts of Devonshire and Cornwall, the principal fishery is in August and September. Pilchards are caught either with drift-nets or sean-nets, but principally with sean-nets. By means of one or more seans, each 260 feet long and 36 feet deep, a shoal is enclosed; the bottom of the net is then drawn together by a peculiar contrivance, and the pilchards are taken out at low water by small bag-nets. Prodigious numbers are sometimes enclosed in a single sean. Twenty-four millions and a half are said to have been taken at once from a single shoal, which, however, may have been spread over several square miles. The approach of a shoal of pilchards is known by the rippling of the water, and the sea-birds hovering above, and is often watched for and marked from the shore. The P. fishery on the English coast has of late been comparatively unsuccessful, probably undergoing one of those unaccountable mutations of which there are so many examples in the herring fishery in different places; but in some years the quantity taken has been very great, and the capital invested in the P. fishery in Devonshire and Cornwall is probably not much under one million sterling. The English P. fishery is regulated by several acts of parliament, the first of which are of the days of Elizabeth. Great quantities of pilchards are annually exported to the West Indies and elsewhere. Those intended for exportation are pickled, and packed in barrels by means of great pressure, by which the bulk is reduced, and oil is expressed to the amount of three or four gallons from a hogshhead of fish. The oil, with the blood and pickle with which it is mingled, is generally used for manure. A favourite Devonshire dish is a pie made of pilchards, with their heads protruding from the crust.—A great number of boats are employed in the P. fishery in and near the estuary of the Tagus.—The P. is known on the coasts of Scotland as the *Gipsy Herring*.

PILCOMAYO, a river of South America, whose course has not as yet been thoroughly explored, draws its waters from the Bolivian Andes, and is formed by the confluence of two rivers, the Suipacha and the Pilaya. Of these head-waters, the south one, the Suipacha, rises in the mountains immediately south of Potosi; while the northern branch, the Pilaya, drains the valleys around Chuquisaca. These streams unite in lat. about $21^{\circ} 35'$ S., to form the P., which flows in a general direction south-east, crosses the Bolivian frontier, waters the north-east region of the Argentine Confederation, and falls into the Paraguay a few miles below Asuncion. It is at least 1200 miles in length; but its waters are much spent in lagunes on its course, so that it adds no great volume to the waters of the Paraguay. It is navigable for about 500 miles; but numerous

hordes of hostile Indians render navigation perilous. Before entering the Paraguay, it divides into two arms, of which the northern is called Araguay-Guaso; and the southern, which is again divided into two branches, the Araguay-Mino. The mouths of the P. are narrow, deep, and much obstructed by water-plants.

PILE, in Heraldry (from Lat. *pilum*, a javelin; or from the *pile* or stake used in the construction of a bridge), an ordinary, or, according to some heralds, a subsidiary, in the form of a wedge, issuing generally, as in fig. 1, from the middle chief, and extending towards the middle base of the shield. It is said that a pile should occupy one-third of the breadth of the chief, or, if charged, double that breadth. When a pile is borne issuing, not from the middle chief, but from some other part of the bounding-line of the shield, this must be specified in the blazon. Three piles are sometimes borne conjoined in point, as in fig. 2. A pile *transposed* is one whose point is upward.

Pile.

third of the breadth of the chief, or, if charged, double that breadth. When a pile is borne issuing, not from the middle chief, but from some other part of the bounding-line of the shield, this must be specified in the blazon. Three piles are sometimes borne conjoined in point, as in fig. 2. A pile *transposed* is one whose point is upward.

PILE-BRIDGE, a bridge of which the piers are built with piles. These may be either temporary wooden structures, in which wooden piles, driven into the ground, serve also as piers, or they may be permanent bridges, with iron cylinders forming the piles below the surface, and piers above. See **PILES**.

PILES are usually squared logs of wood used in engineering operations, such as dams, bridges, roads, &c. They are sharpened at the point, and, if necessary, protected with iron points, to enable them to cut through the strata they encounter as they are driven into the ground. When used for cofferdams, or such temporary purposes, they are placed close together, and driven firmly into the earth; the water is then pumped out, and the piles form a dam, to enable workmen to lay foundations of piers, &c. When the force of the water round the dam is great, two rows of piles are driven in all round, and the space between the rows filled with clay, and puddled. Piles are also used for permanent works, when they are driven through loose soil till they reach a firm bottom, and thus form a foundation on which buildings, roads, &c., may be placed.

Cast iron is frequently used for piles, which are cast hollow. Wharf-walls are sometimes built of piles; they are then cast with grooves on the sides, into which cast-iron plates (forming the walls) are fitted.

A kind of pile has been invented by Mr Mitchell, which is of great use in very loose and shifting substances. It is called the screw-pile, and consists of a long shaft (of wrought iron), with a broad cast-iron disc, of a screw form at the lower end. These piles are especially useful for light-houses, beacons, &c., which have to be placed on sands. They are fixed by means of capstans, which give them a rotatory motion. Common piles are driven in by machines called *pile-drivers*. In these, a heavy weight (or monkey) is raised to a considerable height between two guides, and then let fall on the head of the pile. The application of steam to these drivers has made them very powerful engines—Nasmyth's steam-hammer being a well-known instance.

In 1843, Dr L. H. Potts obtained a patent for a new kind of pile, which consists of hollow tubes of iron, from which the sand, &c., within them is

removed by means of an air-pump, and the pipes are then sunk.

In recent railway bridges, cylinders have been much used to form both piles and piers. They are of cast iron, and made in pieces (of about 6 feet in height), which are applied one on the top of another. The sand or gravel is removed from the inside of the first laid, which thus sinks down; another cylinder is placed above it, and the same process continued till it also has sunk sufficiently; and so on, cylinders over cylinders, till a solid foundation is reached. The requisite number of cylinders is then piled up to form the pier above ground.

PILES, or **HÆMORRHOIDS**, are small tumours situated either within or on the verge of the anus. They consist of folds of mucous and sub-mucous membrane in an inflamed, infiltrated, or permanently thickened condition, and usually contain enlarged veins. There are several varieties of these tumours. Sometimes the pile is mainly composed of a little knot of varicose veins in the sub-mucous tissue; in this case, it is readily emptied, by pressure, of the fluid blood contained in it, which, however, returns when the pressure is removed. Sometimes the blood in a dilated vein coagulates, forming a solid tumour surrounded by tissues, thickened in consequence of inflammation; or the tumour may consist of a kind of erectile tissue formed by an abnormal condition of the vessels of the mucous membrane; this variety is especially liable to bleed. These tumours are divided into *bleeding* and *blind* piles, according as they are or are not accompanied with hæmorrhage; and into *internal* and *external* piles, according as they are within or without the sphincter muscle of the anus.

The following are the general symptoms of this affection. The patient, after having experienced for a varying time a feeling of heat, fulness, and dull pain about the lower part of the bowel, becomes conscious of a sensation as if there were a foreign body in the anus; and on examination after an evacuation, discovers a small tumour, usually about the size of a grape, which either remains outside, or is retracted, according as it originated without or within the sphincter. This tumour gradually increases, and others form around it, until a mass at length results as large as a pigeon's egg, or larger. In its ordinary *indolent* state the tumour has little sensibility, and occasions comparatively little annoyance; but when it is *inflamed* (from stranguation of the sphincter muscle, or from any other cause), it is exquisitely tender to the touch, and is the seat of burning and stinging sensations, rendering the evacuation of the bowels (and sometimes of the bladder also) difficult and painful. In women, an inflamed pile may cause pain in the back, irritation of the womb, with mucous discharge, and many other anomalous symptoms. In severe cases, the patient can neither stand nor sit with comfort, and only finds relief in the horizontal position.

Piles may be caused by any circumstances which cause congestion in the lower bowel, such as luxurious and sedentary habits of life, pregnancy, and such diseases of the liver as tend to check the return of blood from the veins of the rectum. Moreover, anything that causes irritation of the rectum, such as acrid purgatives and especially aloes, dysentery, inflammation of the prostate gland, &c., may cause piles. But of all causes, constipation is probably the most frequent; it operates in producing them partly by the pressure of the accumulated and hardened fæces upon the veins carrying the blood away from the rectum, and partly by the straining and irritation such fæces occasion during their evacuation.

In the treatment of piles, it is expedient to relieve

the congested state of the lower bowel by one or two doses of sulphate of magnesia, and a cooling vegetable diet, after which the continued use of mild laxatives should be resorted to. A teaspoonful of an electuary, consisting of an ounce of confection of senna, half an ounce of cream of tartar, and half an ounce of sulphur, if taken in the middle of the day, usually acts gently about bedtime, which is far the best time for the bowels of patients of this kind to act, as the parts irritated by the passage of the evacuation become quieted during the night. In long-standing cases, in which there is general relaxation of the mucous membrane, the confection of pepper in doses of a drachm may be given thrice daily with advantage, or a scruple of common pitch may be taken at bedtime in the form of pills or in capsules. Amongst the milder forms of local treatment must be mentioned (1) the injection of the rectum with cold water both before and after the motion; (2) washing the anus with yellow soap and water after each evacuation; (3) the application of gall ointment or of other astringents; and (4) the injection of astringent lotions, as, for instance, of sulphate of iron, in the proportion of a grain to an ounce of water. If these fail, recourse may be had to pressure by means of instruments specially devised for the purpose; to the application of strong nitric acid, which, in the case of internal piles, affords the most speedy and effective means of relief (the operation must, of course, be performed by a surgeon, and if the parts cannot be protruded, the acid must be applied through the speculum); to ligature; or, in the case of external piles, to excision. When the piles are inflamed, leeches to the anus (but not applied directly to the tumours) are sometimes required; but the inflammation generally subsides under the influence of rest in the horizontal position, fomentations, poultices, and low diet.

The treatment of the hæmorrhage that frequently accompanies piles requires a few words. If the bleeding is moderate in quantity, and has continued for some time without inducing weakness or any other bad symptom, it is not expedient to interfere with it. When, however, it obviously requires checking, the effect of cold water injected into the rectum, as already recommended, should be tried, and, in case of its failing, astringent injections should be had recourse to. At the same time, the patient should remain in the horizontal position, and take the medicines usually prescribed for internal hæmorrhage, amongst which may be especially mentioned oil of turpentine, in doses of twenty drops three or four times a day, or ergot of rye in divided doses to the extent of a drachm daily. In rare cases, it is necessary to tie a vessel, or to touch it with a red-hot wire (through the speculum), or to plug the anus.

PILEUS. See FUNGUS.

PILEWORT. See RANUNCULUS.

PILGRIM (Ital. *pellegrino*, Lat. *peregrinus*, 'a foreigner,' 'a visitor of foreign lands'). A pilgrim is a person who has undertaken, especially under vow, to visit, for the purpose of prayer and religious worship, some shrine, sanctuary, or other place, reputed to possess some especial holiness or religious interest. That the early Christians—as had been the habit of the Jews, and indeed of the pagan Gentiles also—regarded certain places with some sort of religious interest, seems beyond all question; and among all the places thus reputed as sacred, or at least venerable, the first rank was given to the Holy Land, and particularly to the scenes of the Passion of our Lord at Jerusalem. St Jerome (Ep. xlv.) speaks of the practice of

visiting Jerusalem as established ever since the discovery of the Holy Cross by St Helena, the mother of Constantine. He himself was a zealous pilgrim, and was followed by many of his friends and disciples; and throughout the 4th, 5th, and 6th centuries, pilgrims habitually undertook the long and perilous journey to the Holy Land from almost every part of the West. Other sacred places, too, were held to be fit objects of the same visits of religious veneration. The tombs of the apostles Peter and Paul, and the many tombs of the martyrs in the catacombs at Rome, are so described by St Jerome (*Commentar. in Ezechiei*). St Basil speaks in the same terms of the tomb of the Forty Martyrs; and the historian Theodoret tells of a practice exactly similar to that still seen in Catholic countries, of not only visiting such sanctuaries, but of hanging up therein as offerings, gold and silver ornaments, and even models of hands, feet, eyes, &c., in commemoration of the cures of diseases of their several members, believed to have been supernaturally obtained as the fruit of these pious visits. The PILGRIMAGE, however, pre-eminently so called, was that of the Holy Land; and even after Jerusalem had been permanently occupied by the Saracens, the liberty of transit for pilgrimage, on payment of a stated tax, was formally secured by treaty; and it was from the frequent violation of this immunity, and the necessity of protecting pilgrims from outrage, that the well-known MILITARY ORDERS (q. v.) had their origin. The CRUSADES (q. v.) may in some sense be regarded as a pilgrimage on a great scale; and the direct object of all the expeditions was to secure for the Latin Christians the permanent immunity of pilgrimage. On the other hand, the closing of the Holy Land against western pilgrims, consequent on the final abandonment of the Crusades, led to a great extension of what may be called domestic pilgrimage, and drew into religious notice and veneration many shrines in Europe, which, after the lapse of time, became celebrated places of pious resort. The chief places of pilgrimage in the West were: in Italy—Rome, Loretto (q. v.), Genetsano, Assisi; in Spain—Compostella, Guadalupe, Montserrat; in France—Fourviers, Puy, St Denis; in Germany—Oetting, Zell, Cologne, Trier, Einsiedeln; in England—Walsingham, Canterbury, and many others of minor note. The pilgrim commonly bound himself only by a temporary vow (differing in this from the palmer), which terminated with the actual visit to the place of pilgrimage, or at least with the return home, and by which he was bound for the time to chastity and to certain other ascetic observances. The costume consisted of a black or gray gabardine, girt with a cincture, from which a shell and scrip were suspended, a broad hat, ornamented with scalloped shells, and a long staff. Many abuses arose out of these pilgrimages, the popular notions regarding which may be gathered, although, probably, with a dash of caricature, from Chaucer's *Canterbury Tales*.

PILLAR, a detached support like a column; but its section may be of any shape, whereas the column is always round. Pillars have been used in all styles of architecture, and their forms and ornaments are usually amongst the most characteristic features of the style. The Greek and Roman pillars (or columns) are the distinguishing elements in the various orders. In Gothic architecture, also, the pillars are of different forms at the various epochs of that style. First, in the Norman period, we have plain massive pillars, square, circular, and octagonal, frequently ornamented with zigzag ornaments, spiral bands, &c., on the surface (fig. 1). As vaulting progressed, the

system of breaking the plain surface, and giving to each portion of the vaulting a separate little column or shaft to support it, was introduced. This was done either by attaching shafts to the circular pillars, or by cutting nooks in the pillar and setting little shafts in them, thus: *a, b, fig. 2.*

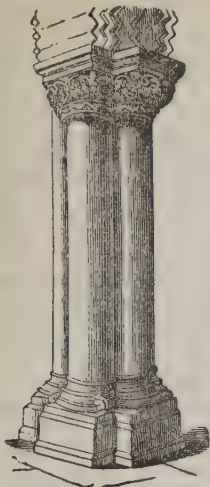

Fig. 1.—Norman Clustered Pillar.

In the Early Pointed Style a plain circular or octagonal pillar, with a number of small shafts attached around it, is a favourite arrangement, thus: *c, d, fig. 2.*

In this style, the attached shafts are very frequently banded to the main pillar at different heights, and they are sometimes made of a finer material, such as Purbec marble. In the Decorated Style the pillar is of a lozenge form, and not so much ornamented with detached shafts as with

mouldings; plain, circular, or octagonal pillars, however, are used in this, as in all the styles. The mouldings and shafts are usually filleted; and

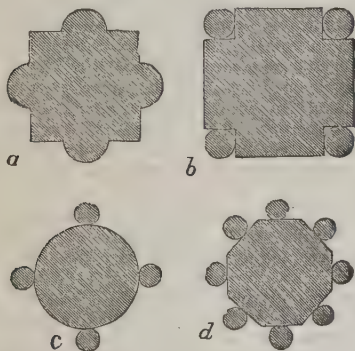

Fig. 2.

some of the mouldings run up into the arch without any cap. In Perpendicular the same idea is further carried out; the mouldings become thinner, and are more frequently run up into the arch without caps. See FLAMBOYANT.

PILLAR SAINTS—called also 'STYLITES' (Gr. from *stylos*, a column), 'Pillarists,' 'Holy Birds,' 'Air Martyrs,' and several similar names—a very remarkable class of anchoretical Ascetics (see ASCETICISM), chiefly of Syria, who, with a view to separating themselves more completely from earth and fellow-men, took up their abode on the tops of pillars, on which they remained without ever descending to earth, and exposed to all the variations of a Syrian climate. The earliest of them, and the most celebrated, Simeon (called also Simon) the Stylite, had been a monk, and had lived, in the beginning of the 5th c., in extreme seclusion in his monastery for nine years, without ever moving from his narrow cell. Increasing in enthusiasm, he withdrew to a place about 40 miles from Antioch, where he built a pillar,

on the top of which, only a yard in diameter, he took up his position. From this pillar he removed to several others in succession, each higher than its predecessor, till at last he attained to 40 cubits, or about 60 feet, in height. In this mode of life he spent 37 years, his neck loaded with an iron chain, and his lips engaged in constant prayers, during the recitation of which he bent his body so that his forehead touched his feet. His powers of fasting were no less marvellous; he is said to have frequently limited himself to a single meal in the week, and during the forty days of Lent abstained entirely from food. The fame of his sanctity brought crowds of pilgrims from the most distant countries, even Britain itself, to see him; and the admiration of his austerities is said to have converted many pagans and Saracens to the church. In trial of his virtue, through the test of humility, some neighbouring monks reproaching him with vanity, and the love of novelty in this extraordinary mode of life, ordered him to come down from his pillar. Simeon prepared without hesitation to comply, and the compliance was accepted as an evidence of his perfect humility and holiness of purpose. It is said that in consequence of an ulcer which was formed on one of his legs, he was obliged for the last year of his life to remain on his pillar upon one foot. In this position he died in 460, aged 72 years. A disciple of Simeon, named Daniel, succeeded to his reputation for sanctity; and to his mode of life, which he maintained for 33 years, in the still more trying climate of the shores of the Bosphorus, about 4 miles from Constantinople. The marvels of Daniel's career are still more startling. He was sometimes almost blown by the storms of Thrace from the top of his pillar. At times for days together he was covered with snow and ice. How he sustained life, what nourishment he took, was a mystery even to his disciples. The emperor at length insisted on a covering being placed over the top of the pillar, and Daniel survived till the year 494. In Syria there were many pillar saints as far down as the 12th c.; but in the west, Daniel is all but a solitary example. A monk named Wulfailich, near Trier, attempted the pillar-life in the 6th c., but the neighbouring bishops compelled him to desist, and destroyed his pillar.

PILLNITZ, a palace and ordinary summer residence of the royal family of Saxony, in a beautiful situation seven miles south-east of Dresden. The grounds are finely diversified, and the walks ascend to the summits of hills, of which one is nearly 1000 feet high. P. acquires a historic interest from the meeting of princes held in the castle in August 1791, when the Declaration of Pillnitz was framed, according to which Austria and Prussia agreed to declare the circumstances of the king of France (then a prisoner in the Tuileries, after his ineffective flight to Varennes) to be a matter of common interest to the sovereigns of Europe, and to express the hope that common cause would be made for his restoration. The emperor and the king of Prussia were resolved to use force in order to effect this result; but any immediate interference on their part was rendered unnecessary by Louis's acceptance of the constitution as modified by the National Assembly, after which he was again placed on the throne.

PILLORY, an engine for the public punishment of criminals, disused in Britain since 1837; but previous to that time commonly employed, as it also was in France and Germany. It consisted of a stout plank fixed like a sign-board on the top of a pole, the pole being supported on a wooden platform elevated above the ground. Above, and

parallel to this plank another of similar dimensions was placed in a similar position with respect to the pole, and fixed to the former by a hinge, being thus capable of being moved upwards from it, or closed upon it, when necessary. A large circular hole is cut, with its centre in the line of junction of the two planks, and two corresponding holes of smaller size are formed, one on each side of it; the large hole is for receiving the neck, and the two smaller the wrists. When a criminal is to be placed in the pillory, he is made to mount and stand upon the platform; the upper of the two hinged planks is raised to allow the culprit's neck and wrists to be inserted in their proper grooves, and then brought down into its place, and fastened by a padlock, or in some other way. See for illustration the wood-cut to the article OATES, TITUS. The pillory seems to have existed in England before the Conquest, in the form of the stretch-neck (an instrument by which the neck only was confined), and was originally intended, according to the 'Statute of the Pillory' (51 Hen. III. c. 6), for 'forestallers, users of deceitful weights, perjury, forgery, &c., and all such dishonourable offences. Its use was exclusively confined to this class of offenders till 1637, when restrictions were put upon the press, and all who printed books without a licence were put in the pillory. From this time it became the favourite mode of punishing libellers (or those who were considered to be such by the government), authors and publishers of seditious pamphlets, or of strictures on the government; and many eminent men were accordingly from this time put 'in and on the pillory,' among whom may be mentioned Leighton, Lilburn and Warton the printers, Prynne, Dr Bastwick, Daniel Defoe, &c. The insufficiency of the pillory as a means of inflicting a definite amount of punishment was now apparent, for to those who were popular favourites it was no punishment at all, while those who were objects of popular dislike were ill-used to such an extent as occasionally to cause death. The sufferers above mentioned being popular favourites, or having at least a numerous class of supporters, were shaded from the sun, fed, and otherwise carefully attended to; while the encouragement, applause, and sympathy of the crowd around converted the intended punishment into a triumph; but such men as Titus Oates, and the class of offenders including perjurers, swindlers, polygamists, &c., who were objects of popular hatred and disgust, were pelted with rotten eggs (the favourite missile), garbage, mud, sometimes even with more dangerous missiles. In 1814 the celebrated naval hero Lord Cochrane (see DUNDON-ALD, EARL OF) was sentenced to the pillory, but the government of the day was not prepared to brave the consequences of such an act, and the sentence was not carried into effect. In France the pillory was anciently called *pilori*, and in recent times *carcan*, from the iron collar by which the criminal's neck was attached to the post; but punishment by this mode was abolished in that country in 1832.

PILLS are the most generally convenient and popular of all forms of medicine. They are formed from masses of a consistence sufficient to preserve the globular shape, and yet not so hard as to be of too difficult solution in the stomach and intestines. This form is especially suitable for (1) all remedies which operate in small doses, as metallic salts; (2) those which are designed to act slowly and gradually, as certain alteratives; (3) those which are too readily soluble when exhibited in other forms; (4) substances whose operation it is desirable to retard until they have reached the lower intestines, as in certain pills for habitual costiveness; (5) bodies whose specific gravities are

too inconsiderable to allow their suspension in aqueous vehicles; and (6) fetid substances: while it is unsuitable for (1) medicines which require to be given in large doses; (2) deliquescent salts; (3) fluid or semi-fluid substances, such as oils, balsams, &c., which require a very large proportion of some dry powder to render them sufficiently tenacious to form into a mass; (4) substances so insoluble, that when exhibited in solid form they pass through the intestinal canal unaltered, as 'extract of logwood (Paris's *Pharmacologia*, 9th ed. p. 550). Many substances, such as vegetable extracts, may be at once formed into pills without any addition; but most substances require the addition of a material termed an excipient, for converting them into a pill-mass. The excipients in most common use are bread-crumbs, hard soap, extract of liquorice, mucilage, syrup, treacle, honey, castor oil, and conserve of roses. From the property of preserving pills for a long time in a properly soft state, the most valuable excipient is the conserve of red roses; and, perhaps, next to it treacle is the most valuable excipient, as it does not undergo any change by time, but maintains a proper consistence, and preserves the properties of vegetable powders unimpaired for years. It is common to place pills in some fine powder, to prevent them from adhering to each other, and to conceal their taste. For this purpose, liquorice powder, wheat flour, starch, and magnesia are generally used in this country, and lycopodium on the continent. Pills retain their moisture and activity far longer in small bottles than in the ordinary pasteboard boxes. The ordinary weight of a pill is five grains; if it much exceeds that weight, it is too bulky to swallow conveniently if it consist of vegetable matter. It is very common to meet with patients who express their inability to take this form of medicine. If, however, they practise with a small globular mass, towards which they feel no repugnance, as a pellet of bread or a currant, placing it on the back of the tongue, and gulping it down with water, they will soon get over the difficulty.

PILOT is a person specially deputed to take charge of a ship while passing through a particular sea, reach, or dangerous channel. The intricacy of almost all coast navigation renders it impossible that any navigator, however skilful, can be master of all the waters to which he may have to sail his ship; and the risk of failure, through ignorance of local dangers, is therefore avoided by transferring the direction of her course to some one perfectly acquainted with the spot. The man to whom so much is intrusted must be a responsible person, and therefore in all countries qualified sailors are officially licensed to act as pilots in their districts, and they are granted the monopoly. The origin of the word pilot is uncertain; but it is probably taken from or nearly identical with the Dutch *piloot*, which is compounded of *peilen*, to sound the depth, and the root which appears in *D. lootsman*, *O. E. lodesman*, and signifies to lead, direct. Pilot thus means one who conducts a vessel by sounding. The laws of Wisby, promulgated at least as early as the 14th c., and subsequently incorporated in nearly every maritime code, render it compulsory on the master of a ship to employ a pilot when sailing near a coast.

The British laws relating to pilots were revised and consolidated by the act 16 and 17 Vict. c. 129. Certain fees are established in proportion to the distance and responsibility; and the master of every vessel, above 50 tons, passing up the Channel or the Thames, or *vice versa*, is required to accept the services of the first pilot tendering, provided he

shews his licence as a proof of qualification. Except in matters of discipline, the command of the vessel is then vested entirely in the pilot, who can have the sails, steering, &c., of the ship carried on entirely at his discretion until the limit of the pilot's district is passed, except that the captain resumes his powers when the question of taking up ground in a harbour is concerned. The fees vary with the draught of the ship and the distance; as specimens, may be cited the highest and lowest in the London district: a ship drawing 22 feet of water is piloted from Orfordness to Blackwall for £27, 12s.; a ship drawing not more than 7 feet is guided from Gravesend Reach to Long Reach for 9s. 3d.

Pilots are associated in guilds called Brotherhoods, of which the principal are the Brotherhood of the Trinity House of Deptford-Stroud, situated on Tower Hill, which has jurisdiction over the Thames, Medway, and the coast from Harwich to the Isle of Wight; and the Trinity Houses of Kingston-upon-Hull and Newcastle-on-Tyne. There are also societies of pilots at the larger ports out of these districts, the government in such case being vested in certain officials lawfully appointed as 'pilotage authorities.' Their powers over the members, &c., are defined in the act above quoted, and in the Merchant Shipping Act of 1854, 17 and 18 Vict. c. 104, sections 330—338.

Pilots board vessels entering their districts in boats conspicuously painted, on the bows and sails of which must be the man's distinguishing number as shewn by his licence. The boat also bears a flag of comparatively large size, of red and white divided horizontally. A ship requiring a pilot hoists a square blue flag. In passing up or down the Thames, every ship above 50 tons or 6 feet draught must bear a pilot; but her master or first-mate may act by licence in that capacity, if he have passed the necessary examination. A master is subject to a penalty for sailing without a pilot; and, on the other hand, so also is any person, without a licence, or whose licence has been forfeited, presuming to act or offering to act as a pilot.

In the navies of some countries the pilot is a permanent officer of the ship, and has charge of her course; but his functions in that case approach nearer to those of the British Master (q. v.). Large French vessels have often several sailing pilots called *pilotes hauturiers*, and a *pilote côtier* or *lamaneur*. The ancient laws of France contained provisions for the education and regulation of both these classes.

The general rule as to the responsibility of the owners of the ship is, that no owner or master of a ship is answerable to any person whatever for any loss or damage, occasioned by the fault or incapacity of any qualified pilot, acting in charge of such ship within any district where the employment of the pilot is compulsory.

PILOT-FISH (*Naucrates dactor*), a fish of the family *Scomberidae*, and belonging to a section of that family in which the first dorsal fin is represented by mere spines, and there are no finlets behind the second dorsal and the anal fins as in the mackerel, &c. The shape of the P. is very similar to that of the mackerel. It is usually about a foot long; the general colour silvery grayish-blue, five dark-blue transverse bands passing round the whole body. Its flesh is very delicate, and resembles mackerel in flavour. It is common in the Mediterranean, and appears to be widely diffused through the warmer parts of the ocean, often following ships for a long time and very far, in which way it has been known to come from Alexandria to Plymouth. It is, however, of rare

occurrence even on the southern coasts of Britain. It is supposed to be the *Pompilius* of the ancients, which was believed to point out their desired course to sailors. It is often seen in the company of a shark, and is therefore very commonly supposed to direct the shark to its prey. Concerning this many wonderful stories are to be found in the writings both of voyagers and of naturalists. It has been

Pilot-fish (*Naucrates dactor*).

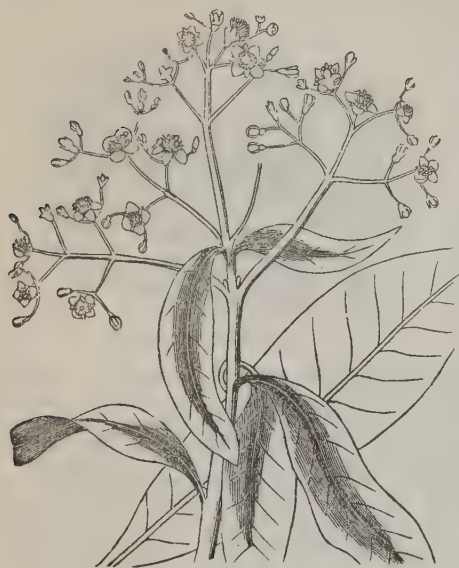

contended, on the other hand, that the P. merely follows the ship along with the shark for the same object that gulls follow the steam-boats on our coasts, to feed on anything eatable that may fall or be thrown overboard; or that it attends the shark in order to seize small morsels of its large prey. The following statements of Dr Bennett may be received with confidence: 'I have observed that if several sharks swim together, the pilot-fishes are generally absent; whereas, on a solitary shark being seen, it is equally rare to find it unaccompanied by one or more of these reputed guides. . . . The only method by which I could procure this fish was, that when capturing a shark I was aware these faithful little fishes would not forsake him until he was taken on board; therefore by keeping the shark, when hooked, in the water until he was exhausted, or, as the sailors term it, "drowned," the pilot-fish kept close to the surface of the water over the shark, and by the aid of a dipping-net fixed to the end of a long stick I was enabled to secure it with great facility' (*Gatherings of a Naturalist*).—A much larger species of *Naucrates* is found on the coasts of South America.

PILPAI. See BIDPAL.

PILSEN, a town of Bohemia, in a fertile and beautiful valley at the confluence of the Mies and the Beraun, 52 miles west-south-west of Prague. The church of St Bartholomew (built in 1292), the town-hall, and the house of the Teutonic Knights are interesting Gothic edifices. The town also contains a gymnasium and other educational institutions, an arsenal, theatre, and a number of churches and convents. P. has leather and cloth-factories, a great alum-work, iron and coal mines, and an important brewery. Pop. about 25,000.

PIMENTO, **PIMENTA**, **ALLSPICE**, or **JAMAICA PEPPER**, a well-known spice, is the dried fruit of *Eugenia Pimento* (see *EUGENIA*), a small West Indian tree, which grows to the height of twenty or thirty feet, and has oblong or oval leaves about four inches long, of a deep shining green, and numerous axillary and terminal trichotomous panicles of white flowers, followed by small dark-purple berries. The P. tree is much cultivated in some of the West Indian Islands. It is a very beautiful tree, with straight trunk and much branching head; and about the month of July is covered with an exuberance of flowers, which diffuse a rich aromatic odour.

The leaves and bark partake of the aromatic property for which the fruit is valued. The fruit, when ripe, is filled with a sweet pulp, and the aromatic property, which so strongly characterises it in an unripe state, has in a great measure disappeared. The gathering of the berries, therefore, takes place as soon as they have reached their full

Pimento.

size, which is about that of pepper-corns. They are gathered by the hand, and dried in the sun on raised wooden floors, during which process great care is taken, by turning and winnowing, to prevent them from being injured by moisture. Their colour changes in drying, from green to reddish-brown. When dry they are packed in bags for the market. Some planters kiln-dry them.—The name *Allspice* was given to *P.* from a supposed resemblance in flavour to a mixture of cinnamon, nutmeg, and cloves. *P.* is much employed in cookery, and is also used in medicine as a carminative and stimulant, to prevent the griping of purgatives, and to disguise the taste of nauseous drugs. It depends for its properties chiefly on a volatile oil, *Oil of P.*, which is obtained from it by distillation with water, and is sometimes used to relieve toothache, and for making the *Spirit of P.* (or of *Allspice*) and *P.* (or *Allspice*) *Water* of the shops.

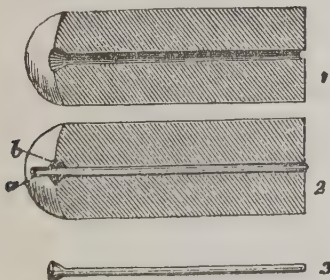

PIMPERNEL (*Anagallis*), a genus of plants of the natural order *Primulaceae*, having a wheel-shaped corolla, and the capsule opening by division round the middle. The species are elegant little annual and perennial plants, natives chiefly of temperate climates. The flowers are not large, but very beautiful.—The **SCARLET P.** (*A. arvensis*) is a common plant in Britain, occurring as a weed in fields and gardens; it is common also in most parts of Europe, and in many parts of America. The flowers are of a fine scarlet colour, with a purple circle at the eye. There is a common belief in England, mentioned by Lord Bacon, that when this plant opens its flowers in the morning a fine day may be expected; and they certainly close very readily on the approach of rain. They usually open about eight in the morning, and close about noon.—The **BLUE P.** (*A. cærulea*) is far less common in Britain,

but very abundant in some parts of Europe.—The **Bog P.** (*A. tenella*), frequent in bogs in England, but rare in Scotland, is an exquisitely beautiful plant.—Several species are cultivated in our flower-gardens.—Acrid properties prevail in this genus, and *A. arvensis* has been used medicinally in epilepsy, dropsy, and mania.—The name **WATER P.** is given to *Samolus Valerandi*, also called *Brookweed*, another British plant of the same order, with racemes of small white flowers, growing in watery gravelly places. It is supposed to be the *Samolus* which Pliny says the Druids gathered fasting, with the left hand, and without looking at it, ascribing to it magical virtues in the cure and prevention of diseases in cattle. Its geographic distribution extends over almost all the world.

PIN. As a requisite of the toilet, &c., pins were first used in Britain in the latter part of the 15th c.; they were at first made of iron wire, but in 1540 brass ones were imported from France by Catharine Howard, queen of Henry VIII. Several inventions, however, were previously in use for holding together parts of the dress, such as buckles, brooches, laces, clasps, hooks, &c. At first pins were made by filing a point to a proper length of wire, and then twisting a piece of fine wire around the other extremity, or fixing it after twisting, in order to form a knob or head; and ultimately these operations were so skilfully conducted, that a completely round head was made of very small size, and scarcely shewing the nature of its construction. Some pins are still made in this way. It is surprising how many operations are needed to complete so small an article. They are as follows: 1. *Straightening and Cutting the Wire.*—The straightening is necessary, because the wire-drawers coil the wire as they make it upon a cylinder, and when it is unrolled, the coils remain. It is therefore drawn through an arrangement of upright iron rods which completely straighten it, after which it is cut into lengths of 30 feet, and these are again reduced to lengths of four pins. 2. *Pointing.*—This is done by two operations and different workmen, each standing at a separate grindstone; the first is the rough grinder, and the second the finisher. Each holds with the thumb on the palm of the hand a number of the wires amounting to 30 or 40, and by a movement of his thumb he manages to make the wires turn round so as to make a point to each as he holds them to the grindstones, the second of which, being of a fine material, gives them a smooth finish; they are then reversed, and the other end pointed. 3. *Cutting.*—The length of a single pin is cut off of each end of these pieces; the intermediate portions are then handed back to the pointers, and each end receives a point, after which they are divided into two, and thus the four pin piece is reduced into single pin lengths, each having a point. 4. *Twisting the Heads.*—These are made of very thin wire, which is coiled twice, by means of a lathe, around the end of another piece of wire the same thickness as the pins. 5. *Cutting the Heads.*—The head being formed on the thin wire, it is handed to another workman who cuts it off; these two operations are performed with great rapidity, so great, indeed, that as many as 12,000 have been made in an hour. 6. *Annealing the Heads.*—This is softening them by putting some thousands into an iron ladle, and after making them red hot, plunging them into cold water. 7. *Stamping or Shaping the Heads.*—This is pressing the heads into a better shape by means of a small lever press, and at the same time fixing them on the pins; a good worker will do as many as 12,000 to 15,000 per day. 8. *Yellowing or Cleaning the Pins.*—This is done by a process which is often called *souring*; it consists in boiling them for about half an hour in

the dregs of sour beer, or a solution of argol or cream of tartar, and then washing them in clean water. 9. *Whitening or Tinning*.—In this process a large copper pan is used, and in it is first placed a layer of about six pounds of the cleaned or yellowed pins, and over these a layer of grain-tin to the amount of about eight pounds. Several alternate layers of pins and tin are put in one vessel, and then by a pipe arranged inside the copper pan water is gently poured in, and goes through the pipe to the bottom, first rising up through the different layers so gently as not to disturb them. Fire is now applied to the bottom of the pan, and when it is nearly boiling its surface is sprinkled with a quarter of a pound of cream of tartar, and the whole is slowly boiled for half an hour, then poured into a strainer and shaken, to separate the pins from the grain-tin and liquid; by this process a thin deposit of tin has been thrown on the pins, which now are white instead of yellow; without the souring this would not take place, it being essential that they should be quite free from any oxidation or soil. 10. *Washing*.—The pins are now thoroughly washed in pure water. 11. *Drying and Polishing*.—They are now put into a large leathern bag with a quantity of bran, and violently shaken backwards and forwards by two men. 12. *Winnowing*.—The bran is next separated by fanning. 13. *Pricking the Papers to receive the Pins*.—This is now done by an ingenious machine, through which the papers are passed, and which, at regular intervals, arranged according to the size of the pins, pinches up a fold of the paper, and at the same time pricks the holes to receive the pins, and then places the pins in their places. Formerly this required a separate operation. Thus fourteen persons were required to make and put up for sale a pin, and in some manufactories this is still the case; but in all the large establishments machines are now employed, and an immense reduction of hand labour is effected by them.

The first machine was invented by Lemuel Wellman Wright, of the United States, in 1824. This did very little more than make solid heads to the pins, by a process in principle like that used for nail-making—viz., by driving a portion of the pin itself into a counter-sunk hole. The action, however, was automatic, and consisted in an arrangement by which the wire was seized in two small grooved cheeks, as in figs. 1 and 2, which represent them separated. Fig. 1 has the groove empty, but in fig. 2 is seen the wire which projects at *a*. When both cheeks are

placed face to face, and the wire is held tightly in the groove with the small portion (*a*) projecting, a small ram or hammer connected with the machine strikes on *a*, and compresses it into the small cup-shaped depression *b*, and thus the head is formed, as in fig. 3. The pointing and dressing of the pins was afterwards carried on as described

in the processes for hand-made pins. Since Wright's invention many remarkable improvements have been effected in these machines, which have consequently become very complicated in their details, although the principles upon which they act are very simple. No description would convey a satisfactory idea of these wonderful pieces of mechanism, which now, without the aid of hands, complete the pin in all respects except the colouring and polishing; but a slight account of the leading features will enable the reader to understand their mode of working. First, then, a reel of wire as it comes from the wire-drawer is placed in the rear of the machine, and the end of the wire is taken hold of by a pair of nippers, which pull it over a fixed *straightening board*, and pass it on completely straightened, until it is seized by two cheeks similar to those in figs. 1 and 2, when a cutter descends and cuts it off, leaving the projecting part for the head; on the withdrawal of the cutter, the hammer flies forward, and makes the head as before described; the cheeks open, and the pins drop on to a sloping metal plate finely grooved, down which they slip with the heads upwards, until the end which is to be pointed comes in contact with a cylindrical roller with a grinding surface, which soon grinds points upon them, owing to two or three ingenious arrangements: the first is, that the grooved surface of the plate by which the pins descend terminates a little above the grinding roller, then a slight depression is given to the sloping plate and also to the roller, so that one end is an inch or two lower than the other; therefore, as the pin descends the groove (*a*, fig. 4), and is thus brought down the inclined plate until it lies on the smooth part (*b*, fig. 4), where it is highest, and with its end in contact with the grinding roller (*c*) which is revolving, the pin itself is compelled by the friction of the roller to turn round, and gradually descends from the upper to the lower part of the inclined plate (*d*), and then falls off into

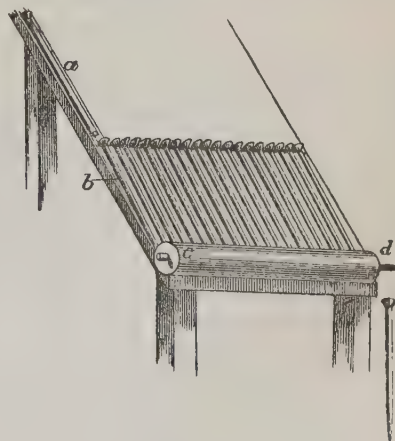

Fig. 4.

a box placed to receive it. This is attempted to be shewn in fig. 4. These operations are performed so rapidly that they can scarcely be followed by the eye, and the pins fall into the box beautifully pointed in a complete stream. They are then *yellowed, tinned, and prepared for papering*, which is a remarkable process. The machine by which it is done is worked by two children; one feeds the machine with pins, the other with papers. The first part of the machine is a box, about 12 inches

long by 6 inches broad and 4 inches deep; the bottom is made of small square steel bars, sufficiently wide apart to let the shank of the pin fall through but not the head, and they are just as thick as the space between papered pins; the bottom of the box, with the row of pins hanging through it, are seen in fig. 5. The lower part of the bottom of the

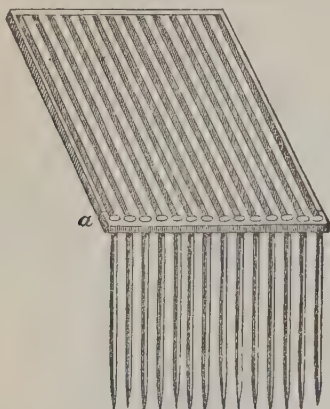

Fig. 5.

box at *a* is made to detach itself as soon as the row of pins is complete, and row after row at regular intervals is received and passed down a corresponding set of grooves, until they reach the paper which is pinched and pierced for their reception. There are (1870) eight pin factories in the United States, whose annual production is 2,000,000 packs, or 6,720,000,000 pins. One factory alone makes eight tons of pins per week. Fifty tons of hair-pins per month are made at the only American factory. American pins are salable throughout the world; the production and consumption are yearly on the increase.

PINA CLOTH, a very beautiful fabric made of the fibres of the leaves of the pine-apple plant (*Ananassa sativa*), and other allied species. This cloth is only made in Manilla, and in its manufacture resembles horse-hair cloth, because the threads both of warp and weft are each single unspun fibres, consequently only small pieces can be made; the workers have, however, a plan of joining the fibres of the coarser kinds end to end, so as to make warp threads of considerable length. Pina cloth is very strong, and the better sorts far excel the finest lawns in texture. It is chiefly employed in the manufacture of ladies' pocket-handkerchiefs, which often have their costliness much increased by beautiful embroidery.

PINCHBECK is an alloy of zinc and copper, in which the proportions slightly differ from those which constitute brass; 3 parts zinc to 16 of copper constitute this material, instead of one part of the former to two of the latter as in common brass. Pinchbeck, when new, has a colour resembling red gold, and it was at the beginning of the present century much employed in making watch-cases and other small articles in imitation of gold.

PIND DADUN KHAN, a town in the Punjab, stands on a narrow verdant plain on the right bank of the Jhelum, and at the southern base of the Salt Range or Kalabagh Mountains, 110 miles north-west of Lahore. The town consists of three groups of houses, four miles from the Jhelum. The houses are built of mud, but the framework is of cedar-wood. In the vicinity, salt is extensively raised in the Salt Range. See **PUNJAB**. Entire population, 13,588.

PINDAR (Gr. *Pindaros*), the great lyric poet of Greece, was born, about 522 B.C., of a noble family of Thebes, at Cynoscephalæ, a village in that territory. His genius for music was hereditary, and at an early age he was sent by his father, himself a flute-player, to receive instruction in the same art from Scopelionus. At this time his genius for poetry too—foreshadowed, according to later writers, by a swarm of bees miraculously resting on his lips when asleep—began to develop itself, and so he went to Athens to be placed under the tuition of Lasus of Hermione, the founder of the Athenian school of dithyrambic poetry. Before completing his 20th year he returned to Thebes, where he continued to pursue his studies under Myrtis and Corinna, of Tanagra, two poetesses then famous in Bœotia. With both of his instructresses he contested the prize for music at Thebes, but was five times defeated by Corinna. He was still a young man when he entered on his professional career as a poet, and his services soon came to be in great request on festive occasions throughout all the Hellenic states. He composed choral songs for Hiero, tyrant of Syracuse; Alexander, son of Amyntas, king of Macedonia; Theron, tyrant of Agrigentum; Arcesilaus, king of Cyrene; and also for many free states and private individuals. He won not only the admiration of his employers for his lyrical genius, but also their respect for his independent character, which, amid all the presents and rewards conferred upon him, never degenerated into that of the poet who merely performed for hire. He was especially the favourite of Alexander, king of Macedonia, and of Hiero, tyrant of Syracuse; and it is said that to the praises he lavished on the former of these monarchs his house owed its preservation at the hands of Alexander the Great, when he reduced the rest of Thebes to ruins. His life was for the most part spent abroad at the courts of kings, and at the scenes of the great public games; and at one period, 473 B.C., he resided at Syracuse at the court of Hiero for the space of four years. He died most probably in 442 B.C., in his 80th year. Of the immense number of his poems, consisting of hymns to the gods, pæans, dithyrambs, odes for processions (*prosodia*), maidens' songs (*parthenia*), mimic dancing songs (*hyporchemata*), convivial songs (*scolia*), dirges (*threnoi*), and encomia on princes, we only possess fragments. His *Epinikia*, or Triumphal Odes, however, have come down to us entire; and it is from these—divided into four books, and celebrating the victories won in the Olympian, Pythian, Nemean, and Isthmian games respectively—that we must form an opinion of P. as a poet. A victory at these games conferred honour not upon the winner and his family only, but also on the city to which he belonged; and for its celebration—which began with a procession to the temple, where sacrifice was offered, and ended with a convivial banquet—a poem was specially composed, and was sung by a chorus either during the procession, or, more frequently, at the banquet (*comus*). P.'s poetical style is peculiar. Full of bold conceptions and striking metaphors, his manner is so rapid and so subject to abrupt transitions, as to render him not only a difficult but an obscure composer. Typical examples of his strength, as well as of his weakness, will be found in the Second Olympian and First Pythian Odes, where the description of the Islands of the Blest in the former, and of an eruption of Mount Ætna in the latter, are brilliant offsets to the shadowy mythological allusion and the undeveloped metaphor which also characterise them. His metres, in spite of the able efforts of Böckh, still remain to be satisfactorily elucidated; and all that we can

here say of them is, that he makes chief use of the Dorian rhythm, and not unfrequently of the Æolian and Lydian. He has been fortunate neither in his numerous imitators nor translators—Gray being, perhaps, the most successful among the former, and Carey and Abraham Moore among the latter. He has been elaborately explained and criticised in Schmidt's *Pindar's Leben und Dichtung* (Bonn, 1852); while his relation to lyric poetry in general forms the subject of Villemain's brilliant *Essais sur le Génie de Pindare et sur la Poesie Lyrique* (Paris, 1859). The best editions are those of Böckh; of Vissien, re-edited by Schneidewin; and of Hartung.

PINDAR, PETER. See WOLCOT, DR JOHN.

PINDUS, anciently the name of a chain of mountains in Greece (q. v.).

PINE (*Pinus*), a genus of trees of the natural order *Coniferae*. The Linnæan genus includes all kinds of Fir, Larch, and Cedar; but as now limited, the genus *Pinus* is distinguished by monœcious flowers, and woody cones with numerous two-seeded scales, the scales having an angular truncated apex. The leaves are linear and very narrow, of a very dark-green colour, growing in clusters or in pairs, and surrounded by scarios scales at the base. To this genus belong many noble and useful trees. They mostly grow in mountainous or other exposed situations, and their narrow leaves are admirably adapted to evade the force of winds, which produce in the tops of pines a peculiar sound, much noticed by the ancient poets, more soft and continuous than in trees of richer foliage. Most of the pines are more or less social, one kind often covering a considerable tract; some of them clothing the sides and even the summits of mountains with magnificent but sombre forests; some growing in lower situations, on otherwise unproductive sandy grounds, as the *Pine Barrens* of North America. The pines growing in the most barren soils, or in the coldest climates and most exposed situations, are often very small; and although very unlike any other shrubs or bushes, are scarcely to be called trees. Pines are widely diffused over the northern hemisphere, being found on mountains within and near the tropics, and in the colder temperate and the arctic regions descending to the level of the sea.

The **SCOTCH P.** or **SCOTCH FIR** (*P. sylvestris*) is the only species indigenous to Britain. It has leaves in pairs, about an inch and a half long; the cones about the same length, obtuse, and with unarmed scales. On very poor soils and at great elevations it is reduced to a kind of shrub, but in favourable situations it becomes a lofty tree. A plank five feet and a half in diameter has been obtained from a Scottish forest. The Scotch P. is of quick growth, but has been known to attain the age of 400 years. Its head is somewhat conical or rounded, and the lower branches die off as the tree grows, leaving the older trees bare of branches for the greater part of their height; but it is more apt to send off large branches than most of the *Coniferae*. There are still native forests of Scotch P. at Braemar and elsewhere in the Highlands of Scotland; and even in the south of Scotland noble trees are to be seen which, probably, were not planted by man. The Scotch P. is not indigenous to the south of England, but having been introduced, is spreading rapidly and spontaneously, along with the Pinaster, in some of the heaths and other unfertile tracts. Immense forests of it exist in some countries of Europe, in some of which it is mingled with the Spruce Fir. In the middle and north of Europe and of Asia, it is found even in plains near the level of the sea, especially where the soil is somewhat sandy; in the south of Europe

it grows only on mountains. Its timber is highly valuable, being very resinous and durable, and is the *Red Deal* or *Red Pine* used in house and ship-carpentry. There is very great difference, however, in the timber of Scotch P. growing in different soils and situations, rich soils and sheltered situations being unfavourable to the quality of the timber, which becomes white, soft, and comparatively worthless; and there exist several varieties of Scotch P., some of which yield timber very superior to others. Many plantations in Britain have, unfortunately, been made of inferior kinds. One of the best varieties is that which forms the northern Scottish forests, often designated *Braemar*

Braemar Pine.

P. by nurserymen. It is remarkable for its very horizontal branches, and is therefore sometimes called *P. horizontalis*.—The Scotch P. is not only valuable for its timber, which is available for some purpose at every stage of its growth, but on account of other products. Common Turpentine is in great part obtained from it, and much Tar, Pitch, Resin, and Lamp-black. See these heads. Oil of Turpentine is sometimes distilled from the cones, and even from the leaves; the leaves have also been used in Germany for the manufacture of a substance resembling tow, and called *Waldwolle* (Forest Wool), suitable for stuffing cushions, &c. The resinous roots are dug out of the ground in many parts of the Highlands of Scotland, and being divided into small splinters, are used to give light in cottages instead of candles. Fishermen, in some places, make ropes of the inner bark, which is applied to a very different use, when most soft and succulent in spring, by the Kamtchatdales and Laplanders, being dried, ground, steeped in water to remove the resinous taste, and used for making a coarse kind of bread.—The **DWARF P.** (*P. Pumilio*, or *P. Mughus*) is found on the Alps and Pyrenees, its trunk often lying on the ground, although sometimes it appears as a bush or low tree. The recumbent trunks are called *Krummholz* (Crooked-wood) and *Kniewolz* (Knee-wood) by the Germans.—The leaves are in pairs, very like those of the Scotch P., but a little longer; the cones are also similar. From the young shoots an oil resembling oil of turpentine is obtained

by distillation, which is a kind of universal medicine among the peasantry of Hungary, as is also the resin spontaneously exuding from the tree, which is known as *Hungarian Balsam*.—The **BLACK P.**, or **BLACK FIR** (*P. nigricans*, or *P. Austriaca*), is another species closely allied to the Scotch P., but remarkable for its very long leaves. It is a native of Austria. It abounds in resin more than any other European tree.—To the same group of pines belongs the **SEASIDE** or **TAURIAN P.** (*P. Pallasiana*, *maritima*, or *Taurica*), which also affords resin in great quantity, and of a very pleasant odour. It is found in many parts of the south of Europe. Its timber is of little value; but great part of the turpentine of the *Landes* and other maritime districts of France is obtained from it. It yields also part of the *Burgundy Pitch* of the apothecaries' shops.—The **ALEPPO P.** (*P. Halepensis*), a native of the south of Europe, Syria, &c., is a very graceful tree of moderate size, with leaves in pairs and slender. It yields a liquid resin or turpentine, which is extracted from it in Provence and elsewhere, and sold as *Venice Turpentine*. The wood is extensively used in the Levant for shipbuilding.—The **LARICIO** (*P. Laricio*) has leaves in pairs, lax, and 4–8 inches long, cones 2–4 inches long, with the scales slightly pointed. It is often called the **CORSICAN PINE**. It grows on the shores of the Mediterranean Sea, and is valuable both for its timber and for its resinous products. In the island of Corsica, it frequently attains the height of 140 feet. It grows well in sandy soils, and has been made particularly useful for preventing the drifting of the sand, and turning to account the otherwise useless tracts between the mouths of the Garonne and the Adour in France, thus also preserving valuable lands which the sand threatened to overwhelm.—The **PINASTER** or **CLUSTER PINE** (*P. Pinaster*) is another of the most important European species. It has cones in whorls of 3, 4, or even 8 together, 4–6 inches long, leaves in pairs, and very long. It is found on the shores of the Mediterranean, and also in the Himalaya and in China. It has been used in France to a great extent, in the same way as the Laricio, for covering waste sandy tracts. The timber is of inferior quality, but great quantities of resin are procured from it. It yields *Bordeaux Turpentine*.—The **PYRENEAN P.** (*P. Pyrenaica*) is a majestic tree, a native of the Pyrenees, and producing very fine timber.—The **CALABRIAN P.** (*P. Bruttia*) somewhat resembles the Pinaster.—The **STONE P.** (*P. pinea*) a tree with a broad umbrella-shaped head, a form often seen also in the Scotch fir, forms a characteristic feature of the scenery of the Mediterranean, and is very often introduced in paintings. It is the *Pinie* of the Germans, the *Pignon* of the French. The leaves are in pairs, 4–5 inches long; the cones very large, ovate, and obtuse. The seeds, which do not ripen till the fourth year, are large, abound in a fixed oil, and when fresh, have a sweet taste resembling that of almonds. They are used in Italy and other countries in the same way as almonds and pistachio nuts for the dessert, in various dishes, also in emulsions, &c., under the names of *pinies*, *pinioles*, and *pignons*. The use of them, however, is almost entirely confined to the countries in which they are produced, as they very soon become rancid. They are sometimes imported into London in the cone, in which way they can be kept longer, but the cost of importation is much increased. The wood of this tree is very useful and beautiful. It yields resinous products only in small quantity.—The **CEMBRA P.**, or **SWISS STONE P.**, which grows in the central parts of Europe and the south of Siberia—a stately tree, with the lower branches more persistent than they

are in most pines, and rigid leaves in groups of three to five—also produces eatable seeds (*Cembra Nuts*), which, although they are extracted with difficulty,

Stone Pine (*P. pinea*).

are much used. The cuticle contains a resinous juice; but in Siberia, this fruit is so much prized, that noble trees are often cut down to obtain it. The *Cembra P.* yields a pellucid, whitish oil, resembling oil of turpentine, and known as *Carpathian Balsam*.

North America produces many species of *P.*, some of them very beautiful and very valuable. Besides those long known, and which are found in the states and colonies near the Atlantic, a number of the noblest species of this genus have, since the commencement of the present century, been discovered in California and the north-western parts of America.—The **RED** or **CANADIAN P.** (*P. resinosa*) is found from Canada to the Pacific, but does not reach far south in the United States. It is the **YELLOW P.** of Canada and Nova Scotia. It delights in dry and sandy soils, and attains a height of 70–80 feet, with a diameter of two feet at the base, the trunk continuing of uniform diameter for two-thirds of its length. The leaves are in pairs, and are congregated towards the extremities of the branches. The timber is highly esteemed for strength and durability, and furnishes excellent planks for ship-building. It is also used for masts.—Somewhat resembling this in botanical characters, is the **NORTHERN SCRUB** or **GRAY P.** (*P. Banksiana*), generally only 3–10 feet high, which begins to appear in the northern parts of the United States upon high mountains, and is interesting as an arctic species, extending further north than any other.—The **YELLOW P.** (*P. variabilis*, or *P. mitis*) abounds from New Jersey to Virginia. It is a tree of 50–60 feet high, 15–18 inches in diameter at the base, with leaves 4–5 inches long, usually in pairs, but sometimes in threes upon the younger shoots. The timber is very extensively used for ship-building, and is largely exported to Great Britain. At Liverpool, it is known as **NEW YORK PINE**.—The **JERSEY P.**, or **SCRUB P.** (*P. inops*), abounds in the lower parts of New Jersey, and thence to the south-west. The leaves are in pairs, 1–2 inches long, the cones armed with strong spines. The tree is from 15 to

40 feet high. Great quantities of tar are made from it in Kentucky.—The **PITCH P.** (*P. rigida*) is a native of the northern and middle parts of the United States, growing on uplands more or less dry, and attaining a height of 70—80 feet, and a diameter of two feet at the base. The leaves are in threes, varying much in length, as the cones do in size. Immense quantities of it are used for fuel. Tar and lamp-black are sometimes made from it.—The **LOBLOLLY** or **OLD FIELD P.** (*P. taeda*) grows in dry and sandy soils in the lower parts of the Southern States, often occupying lands exhausted by cultivation. Vast tracts never cultivated, in the Southern States, are *Pine Barrens*, in great part covered with this species of pine. It attains a height of 80 feet and upwards, and has a wide-spreading crown. The leaves are 6 inches long, in threes, sometimes in fours on young branches; the cones four inches high, with strong spines. The timber is not of much value.—The **LONGLEAVED P.**, or **SOUTHERN P.** (*P. palustris*, or *P. Australis*), is one of the most important of North American forest trees. It furnishes the greater part of the tar, resin, pitch, and turpentine used in the United States. The timber is also very valuable, and is much used for ship-building. In England and the West Indies, it is known as **GEORGIA PITCH PINE**. The tree attains a height of 60—70 feet, and a diameter of about 16—18 inches; the leaves are in threes, and about a foot long; the cones 7—8 inches long, and 4 inches in diameter, with small spines.—The most valuable of the American forest trees is the **WHITE P.** (*P. Strobus*), which attains a height of 150 feet, and a diameter of 5 feet and upwards. It has lax sub-triangular leaves in groups of five; and pendulous cones 4—5 inches long, with thin smooth scales. It is frequently planted in Britain, &c., where it is known as the **WEYMOUTH PINE**. In its native country, it abounds chiefly from lat. 47° to lat. 43°, and southward on the Alleghanies. The timber is not strong, but easily wrought and durable.—Of the species belonging to Western America the most magnificent is the **SUGAR PINE** (*P. Lambertiana*), found on the Rocky Moun-

Lambert's Pine (*P. Lambertiana*).

tains, at an elevation of 3000 to 5000 feet, between lat. 40° and lat. 43°, and chiefly in sandy soils. It attains a height of 200—300 feet, and a diameter of 7 feet and upwards, almost to 20 feet. The trunk

is remarkably straight, and destitute of branches for two-thirds of its height; the leaves in fives, the cones upwards of a foot long. The timber is white, soft, and light; and the tree produces great quantities of a pure amber-coloured resin, which, when the wood is partly burned, is changed into a somewhat saccharine substance, used by the natives as a substitute for sugar. The seeds are eaten either roasted or pounded into coarse cakes.—The **ROCKY MT. WHITE P.** (*P. flexilis*) is found on the Rocky Mts., near the head-waters of the Arkansas, and occurs almost to the limits of perpetual snow. It has a dense crown, formed of numerous and remarkably flexible branches. The leaves are in fives. The seeds are used as food by hunters and Indians.—**PITCH P.** (*P. ponderosa*), native of the Rocky Mts., is a magnificent tree, remarkable for the heaviness of its timber, which almost sinks in water. The leaves are in threes, and 9—14 inches long.—*P. Sabiana*, *P. Coulteri*, and *P. insignis*, are also noble species from the west of North America. The Himalaya Mountains abound in pines, some of which rival in magnificence those of North-west America. The **BHUTAN P.** (*P. excelsa*), much resembling the Weymouth P. in its botanical characters, and attaining a height of 90—120 feet, abounds in Bhutan, although it is not found in the neighbouring countries of Sikkim and Nepal. The wood is highly valuable, being durable, close-grained, and so resinous as to be used for flambeaux and candles.—The **CHEER P.** (*P. longifolia*) of India is a tree of remarkable and most graceful appearance; with leaves in threes, very long, very slender, and generally pendulous. It is abundant on the crests of hills in the lower Himalaya, growing in districts less elevated than the other pines. It is cultivated in some parts of India as an ornamental tree. It is much valued for its resin. The wood is used in India as a substitute for European deal.—The **KHASIA P.** (*P. Khasiana*) is peculiar to the Khasia Mountains, and has very much the general appearance of the Scotch pine.—*P. Gerardiana*, a species with leaves in threes, is a large tree, a native of Nepal. The seeds are eatable.—The mountains of India and the north-western parts of America produce numerous other species; Mexico has a number of very fine ones peculiar to itself; the mountains of St Domingo have one; the Canary Islands have one; China and Japan also have some. The destruction of the American pine-forests is proceeding at an accelerated rate. The timber trees of Maine in acceptable positions are nearly exhausted, and the present generation will witness the destruction of the extensive pineries of Michigan and Wisconsin. The consumption of pine timber in northern Pennsylvania has proceeded for a longer time, and her mountains are nearly disrobed of their giant white pines and hemlocks. The products of the lake pineries are distributed over nearly half the valley of the Mississippi.

The lumber trade of Wisconsin, in 1870, amounted to 1,030,000,000 feet. Chicago alone received 1,017,900,000 feet, partly from Michigan, and St Louis, 240,760,000 feet. The arrivals at Albany by canal, partly from Canada, were 452,362,884 feet, and at N. York tide-water 768,007,819 feet. The mill product of Puget Sound, Washington Ter., in 1870, exceeded 190,000,000 feet. The production of white pine timber by the mills of Williamsport, Pa., reaches an enormous aggregate, supplying a vast home and foreign demand.

PINE-TIMBER.—This term is in general use for the timber of the pine-tribe (see *CONIFERÆ*), and is not confined to that of the genus *Pinus*, but embraces the wood of species of *Abies*, *Larix*, *Araucaria*, *Dammara*, &c. From the Baltic ports the English receive red and white pine, or deal-timber. The former is yielded by the Scotch Fir (*Pinus sylvestris*), and the latter by the Norway Spruce (*Abies excelsa*). These two, with the Larch (*Larix Europæa*), yield the

greatest part of the pine-timber of Europe. Next in importance to these is the pine-timber of the British North American colonies, which is chiefly yielded by the WHITE PINE (*Pinus Strobus*), of which the imports into Britain, in 1869, reached 112,000,000 cubic feet. Canada, in 1870, exported 951,000,000 feet of all kinds to Europe and the United States. The celebrated pitch-pine of Savannah, in the Southern States, is the produce of *Pinus rigida*. It is much used for ships' masts and yards, and for all purposes requiring great strength and durability, in both of which qualities it excels most others of its kind. The timber of Washington T. has carried its fame to all parts of the world, supplying spars for the French navy, railroad ties in India, shipping spars in Egypt, and wharves in China. In 1870 it furnished lading for 113 ships, 491 barks, 45 brigs, and 87 schooners. It is chiefly the product of the Douglas Fir (*Abies Douglasii*), known locally as the yellow cedar. In France, the timber of the Corsican Pine (*Pinus Laricio*) and the Seaside Pine (*Pinus pinaster*) are greatly used. In Italy, the pine-timber is chiefly yielded by the Stone Pine (*P. pinea*) and the Calabrian Pine (*P. Bruttia*); that of Spain is from the Pyrenean Pine (*P. Pyrenaica*). In Germany, and especially in Austria, the Black Pine (*P. Austriaca*) furnishes the greater portion; but the fine-grained, soft white pine, or deal, so much used for sounding-boards of musical instruments, is the wood of the Silver Fir. See FIR. The trade in this timber is very great, for not only do the Germans use it almost exclusively in their vast toy-manufactories and for lucifer-matches, but considerable quantities are exported. The finest is cut in the forests of Bohemia, where large establishments are formed for dressing and preparing the wood for various purposes.

The timber of the Norfolk Island Pine (*Araucaria excelsa*) is sometimes imported for making ships' masts, as several other kinds of pine-timber are imported from time to time, but those mentioned form the great staples of the timber-trade. The chief value of this class of timber-woods is in the combination of lightness and strength with softness of texture and ease in working with ordinary tools; they constitute, in fact, the principal materials of our builders, and are more used than all other kinds of wood together. Much confusion prevails as to their common designations, for in this country alone, *fir*, *pine*, and *deal* are terms applied to all and each of them, according to the caprice of the individual. The two first names are used because the material is derived from one or other of those genera; but the last is a misnomer altogether, as the term deal belongs only to pieces of fir or pine timber cut to particular sizes: they are three inches in thickness, nine inches broad, and of variable length; if of less width, they are called *battens*.

PINEAL BODY, is a small reddish-gray body, of a conical form, and deriving its name from its resemblance to the fruit of the pine. It rests upon the corpora quadrigemina of the brain, in front of the cerebellum. It is about four lines in length, and from two to three in width at its base. It is larger in the child than in the adult, and in the female than in the male. It consists chiefly of gray matter, and in its base is a small cavity, which contains a transparent viscid fluid, in which are granules composed chiefly of phosphate and carbonate of lime, and termed *acervulus cerebri*. This organ was regarded by the ancients as the seat of the soul.

PINE-APPLE, or **ANANAS** (*Ananassa sativa*) a plant of the natural order *Bromeliaceae*, highly esteemed, and much cultivated for its fruit. The

fruit is a *sorosis*, formed by the calyces and bracts of a close spike of flowers, becoming succulent and combined. This is the distinctive character of the genus *Ananassa*. The P. has a number of long, serrated, sharp-pointed, rigid leaves, springing from the root, in the midst of which a short flower-stem is thrown up, bearing a single spike of flowers, and therefore a single fruit. From the summit of the fruit springs a crown or tuft of small leaves, capable of becoming a new plant, and very generally used by gardeners for planting; the P., in cultivation, being propagated entirely by crowns and suckers, as, in a state of high cultivation, perfect seed is almost never produced. The P. is a native of tropical America; it is found wild in sandy maritime districts in the north-east of South America, but it has been very much changed by cultivation. It has also been gradually diffused over tropical and subtropical countries, and not only as a cultivated plant, for it is fully naturalised in many parts both of Asia and Africa. It delights in a moist climate, and consequently does not succeed well in the dry climate of the south of Italy, although the warmth is sufficient. The first particular account of the P. was given by Oviedo in 1535. It was in Holland that it first began to be cultivated in hot-houses; but it was introduced into England in the end of the 17th c., and its cultivation rapidly became general in the gardens of the wealthy. It is only since the peace of 1815 that it has received similar attention in continental Europe. Great care is requisite in the cultivation of the P., which, without it, is generally fibrous and coarse, with little sweetness or flavour; and with it, one of the most delicate and richly flavoured of fruits. Its size also very much depends on cultivation. The size varies from 2½ lbs. to 12 lbs. in weight. The pine-apples grown in British hot-houses are generally much superior to those of the West Indies, because the latter grow almost or altogether without cultivation; but the importation of pine-apples from the West Indies having now been carried on to a considerable extent, and promising to add to the sources of wealth for these colonies, has led to greater care in cultivation there, and consequent improvement of quality.

In the cultivation of the P. in Britain, a tropical heat must always be maintained. It is generally cultivated in hot-houses specially appropriated to it, called *Pineries* or *Pine-stoves*; sometimes also in flued pits; and sometimes even without fire-heat, in frames continually supplied with fresh tanners' bark and dung. The universal practice, till of late, was to grow the plants in pots, plunged to the requisite depth in tanners' bark or other fermenting matter, and these were transferred from one house or one compartment to another, according to their stage of advancement; three years' culture being deemed requisite from the planting of a crown or sucker to the production of the ripe fruit; but the P. is now often planted in beds, and fruit of the best quality is sometimes obtained in fifteen months. The best soil is a rich and rather sandy loam. It is often formed from the turf of old pastures, with dung, peat, sand, &c., thoroughly mixed. Ventilation must be freely allowed from time to time, but care must be taken to keep the atmosphere moist. A P. which has borne fruit is thrown away as useless.

There are many varieties of the P. in cultivation. Of these, some are referred by some botanists to distinct species. But the greater number of varieties are universally referred to *A. sativa*, and differ in the more or less spiny serratures of the leaves, the globular, cylindrical, or pyramidal fruit, its size, &c.

A spirituous liquor (*Pine-apple Rum*) is made from the P. in some warm countries.

The use of the fibre of the P. is noticed in the article BROMELIACEÆ.

PINE-CHAFER, or **PINE-BEETLE** (*Hylurgus piniperda*), a small coleopterous insect of the family *Xylophagi*. See BARK-BEETLE. It is often very destructive to Scotch firs in rich soils and low situations, attacking the young terminal shoot in summer, and soon eating its way into the heart, which it proceeds to excavate so as to convert the shoot into a tube. Pines growing in open situations are little liable to the attacks of this insect; and trees of thirty feet in height, or upwards, are very rarely attacked. The insect is about the size of a seed of the Scotch fir, and of a black or dark-brown colour.

PINE-FINCH, or **PINE GROSBEAK** (*Corythus*), a genus of birds of the family *Fringillide*, nearly allied to Bullfinches and Crossbills, the bill nearly resembling that of the former, but the tongue very similar to the tongue of the crossbills, with the same peculiar bone articulated to the hyoid bone. See CROSSBILL. One species, the COMMON P. (*C. enucleator*), is a very rare visitant of Britain, but is abundant in many of the northern parts of Europe, Asia, and America. It is larger than a bullfinch, but much resembles the bullfinch in form, wings, tail, &c. The general colour of the male is red. This bird frequents pine-forests, and associates in flocks in winter. It is easily tamed. Its song is rich and full.—There are other species in the northern parts of the world.—The name P. is given in North America to a very different and much smaller bird (*Carduelis pinus*).

PINEL, **PHILIPPE**, a celebrated French physician, was born 20th April 1745, at Saint-André, in the department of Tarn, France; and after receiving a good classical education at the college of Lavaur, removed to Toulouse, where he studied medicine, and took his degree in 1773. He continued his medical studies at Montpellier, maintaining himself meantime by teaching mathematics; and in 1778 removed to Paris, where he acquired some reputation by a translation into French of Cullen's *Nosology* (1785), and the works of Baglivi (1788), and also by some Memoirs on subjects connected with zoology and comparative anatomy. Having applied himself with success to the study of mental alienation, he was charged, in 1791, to make a report on the insane inmates of the Bicêtre, became chief physician of this institution in 1793, and in 1795, was chosen to the same office at the Salpêtrière (a similar asylum, but for females). In the latter institution, P. commenced a class of clinical medicine, which he continued after his appointment to the chair of Medical Physics and Hygiene, and subsequently that of Pathology, at the School of Medicine in Paris. He was admitted as a member of the Institute in 1803, and died at Paris, 26th October 1826. His most valuable works were his *Traité Médico-philosophique de l'Aliénation Mentale* (1791), and *La Nosographie Philosophique* (1798), with its commentary, *La Médecine Clinique* (1802). P. gained for himself undying fame by his reformation of the old barbarous methods of treating the insane. The physicians brought up under the old system were not ashamed to offer a vigorous opposition to P.'s philanthropic opinions; but he fortunately succeeded in thoroughly establishing their correctness, and his system in a few years prevailed over the whole of Europe.

PINEROLO, or **PIGNEROL**, a town in the north of Italy, on the Clusone, at the entrance of the valley of Perosa, in the province of Turin, and 23

miles by railway south-west of the city of that name. It was formerly strongly fortified, and was the residence of the rulers of Piedmont. It contains a new cathedral, a bishop's palace, seminaries, barracks, &c. The ruins of the *citadel*, for some time the prison of the *Man with the Iron Mask* (q. v.), are still to be seen on the hill of St Brigid. Broad-cloth, paper, leather, iron, and silk, are manufactured. Pop. 14,260.

PINE-WOOL Several attempts have been made of late years to utilise the leaves of pine and fir-trees, which are cut down in vast numbers for their timber only. The leaves contain a considerable quantity of fine vegetable fibre, which, when separated, has much the appearance of cotton. In Germany, several works have been established for preparing this fibre, and fitting it for various applications; and under the name of pine-wool, it is now sold for stuffing cushions, making wadding, &c. The principal manufacture is near Breslau in Silesia, where it is carried on by the inventor, Herr Pannewitz.

PINEY TREE. See CALOPHYLLUM.

PINEY-VARNISH. See DAMMAR.

PINGUI'OLA. See BUTTERWORT.

PINHOEN, OIL OF. See PHYSIO NUT.

PINK (*Dianthus*), a genus of plants of the natural order *Caryophyllaceæ*, of which there are many species, annuals and perennials, with beautiful and often fragrant flowers, chiefly natives of Europe and the temperate parts of Asia. The calyx is tubular, 5-toothed, with two or four scales at the base; there are five petals suddenly contracted at the throat of the corolla into a linear claw. There are ten stamens, and one germen with two styles. The capsule is cylindrical, and one-celled. The exquisite beauty of the flowers has attracted admiration in all ages; and some of the species have long been much cultivated in gardens, particularly the GARDEN P. and CARNATION (q. v.), which are often referred to one original, the CLOVE P. (*D. caryophyllus*), a native of the south of Europe, growing wild on rocks and old walls, and naturalised in some places in the south of England; whilst some botanists refer the garden pinks in part to the MAIDEN P. (*D. deltoides*), a pretty common British species, and those called Pheasant-eye pinks to the FEATHER P. (*D. plumarius*), a native of some parts of continental Europe, differing from the Clove P. chiefly in having the leaves rough on the margin, and the petals bearded and much cut. Nearly allied to them is *D. superbus*, found in moist places in some parts of Europe, and not unfrequently to be seen in flower-borders. It has very fragrant flowers. All the varieties of Garden P., whatever their origin, have been much changed by cultivation, and careful cultivation is requisite to preserve them in perfection. Both single and double pinks are generally propagated by *pipings*, which are short cuttings of the younger shoots. They are also sometimes propagated by layers. A rich loamy soil is the best for pinks. The Clove P., in a wild state, has flesh-coloured flowers. The leaves are linear-awl-shaped, grooved, and glaucous. The Maiden P. is a small much branched plant, growing in grassy places, on gravelly and sandy soils; it has rose-coloured flowers spotted with white, and a white eye encircled by a deep purple ring.—The Deptford P. (*D. Armeria*) and the CLUSTERED P., or CHILDEING P. (*D. prolifer*), also natives of England, differ from these in being annuals, and in having clustered flowers.—The BEARDED P., or SWEET WILLIAM (*D. barbatus*), a native of the middle of Europe and the south of France, with lanceolate leaves, flowers

crowded in dense clusters at the top of the stem, acuminate bracts, and bearded petals, has long been a favourite garden-flower, still retaining its place alike in palace and cottage gardens. Although perennial, it is sown annually by florists, to secure fine flowers, and there are many varieties, single and double, exhibiting much diversity of colour.—The INDIAN P. or CHINA P. (*D. Chinensis*) is now also common in flower-gardens.

The Clove P. was formerly regarded as possessing medicinal properties, and was used in nervous maladies.—*Sea P.* is a common name of Thrift (q. v.).

PINK COLOURS, very light shades of rose-red colour: they are usually produced by extreme dilution of cochineal or carmine, Brazil and Braziletto wood colours, with whiting. Some mineral pinks for oil colours are obtained from preparations of manganese, &c. See RED COLOURS. The term pink is also applied to several Yellow Colours (q. v.).

PINKERTON, JOHN, an industrious and learned *littérateur*, was born at Edinburgh, 17th February 1758, and educated at the grammar-school of Lanark, where he was noted for the unusual excellence of his classical attainments, and for his hypochondriacal tendency. He was afterwards apprenticed to a Writer to the Signet, his father refusing to let him proceed to the university; and while engaged in the irksome and distasteful practice of law, he published an *Ode to Craigmillar Castle* in 1776, which he dedicated to Dr Beattie. In 1780, he went to London, where he settled as a man of letters. Next year, he gave to the public a volume of *Rimes* (as he called his pieces), and a collection of *Scottish Tragic Ballads*, followed in 1783 by a second collection of *Ballads of the Comic Kind*—both of which subsequently appeared under the title of *Select Scottish Ballads*. They professed to be ancient, but many of them were really compositions—*forgeries*, some might say, of P.'s own, and would hardly deceive a critical archaeologist. In 1784, he published an *Essay on Medals*, which went through several editions, and long held a high place among books on numismatics; and in 1785, *Letters on Literature*, marked chiefly by a novel system of orthography (e. g., the use of *a* instead of *s* in forming plurals), intended to soften the harshness of the English language, and which was abused as heartily as it deserved. These *Letters* were, however, the means of introducing him to Walpole, through whom he became acquainted with Gibbon and other literary celebrities. P.'s next publication was a most valuable one, *Ancient Scottish Poems never before in Print, from the MS. Collections of Sir Richard Mailland of Lethington, Knight* (2 vols. Lond. 1786). It was followed in 1787 by his once notable *Dissertation on the Origin and Progress of the Scythians or Goths*, in which, for the first time, appears that grotesquely virulent hatred of the Britanno-Celtic race—Scotch Highlanders, Welsh, and Irish—that reaches its climax in his *Inquiry into the History of Scotland preceding the Reign of Malcolm III.* (2 vols. Lond. 1790), where he affirms again and again, obviously with the extremest gusto, that the Highlanders are 'mere savages, but one degree above brutes;' that they are just as they were 'in the days of Julius Cæsar;' that 'like Indians and Negroes,' they 'will ever continue absolute savages,' and that 'all we can do is to plant colonies among them, and by this, and encouraging their emigration, try to get rid of them.' But in spite of this extravagant truculence of speech, the *Inquiry* contains a great deal of important matter—rare and curious historical documents, some of which are to be found nowhere else in print. P. left

England in 1802, and fixed his residence at Paris, where he died 10th March 1826, after a life of hard literary work. His principal publications, besides those already mentioned, are, *The Medallist History of England to the Revolution* (1790); *Scottish Poems* (3 vols. 1792), reprinted from scarce editions; *Iconographia Scotica, or Portraits of Illustrious Persons of Scotland, with Biographical Notes* (2 vols. 1795—1797); *The History of Scotland from the Accession of the House of Stuart to that of Mary* (2 vols. 1797), valuable for its laborious investigation of original materials, but disfigured, in a literary point of view, by an imitation of the grandiose style of Gibbon; *Walpoliana*, a collection of his notes of his friend Horace Walpole's conversation, in 2 vols.; *The Scottish Gallery, or Portraits of Eminent Persons of Scotland, with their Characters* (1799); *Modern Geography* (3 vols. 1802—1807); *General Collection of Voyages and Travels* (16 vols. 1808—1813); *New Modern Atlas* (1809—1815); and *Petrology, or a Treatise on Rocks* (2 vols. 1811).

PINK ROOT. See SPIGELIA.

PINNA, a genus of lamellibranchiate molluscs of the same family with the Pearl Mussel (*Aviculide*), and having a shell of two equal wedge-shaped valves, closely united by a ligament along one of their sides. The mantle is closed on the side of the ligament; the foot is small and conical. The byssus is remarkably long and silky; and by it the species affix themselves to submarine rocks and other bodies, sometimes even to sandy or muddy bottoms. The best known species is *P. nobilis*, a native of the Mediterranean, the byssus of which was used by the ancients for fabrics, but chiefly as an article of curiosity, to which a great value was attached. It is still so used in Sicily and elsewhere. It is very strong and lustrous. The only reason against its more general use is the difficulty of procuring it in sufficient quantity. The byssus of this species is sometimes two feet long, the shell is about the same length. Pinnæ are often found in large beds, with only the edges of their shells appearing above the mud or sand. The animal is eaten.

PINNACE (from the Ital. *pinaccia*, a diminutive of *pino*, a ship) was originally a small vessel, usually schooner-rigged, employed as tender to a large ship, for the purpose of communicating with the shore, &c. At present, however, the signification is limited to a large boat carried by great ships. It is smaller than the launch, but larger than the cutters; and is generally rowed 'double-banked,' by from ten to sixteen oars.

PINNACLE, an ornamental termination much used in Gothic architecture. It is of simple form in the earlier periods of the style, having a plain square or octagonal shaft and sloping roof or top, terminating with a finial; but in later examples, the pinnacle is greatly developed, and becomes one of the most varied and beautiful features of the style. It is ornamented with shafts bearing canopies, and niches filled with statues. Pinnacles are most frequently used on buttresses and parapets, and when placed over the former, serve as a deadweight to increase their power of resisting a thrust.

PINNULE, in Botany, a leaflet of a pinnate leaf, or of one which is bipinnate, tripinnate, &c. See LEAVES. The term is more frequently used, however, to designate the ultimate divisions of the fronds of ferns, when divided in the same manner.

PINSK, a town of West Russia, in the government of Minsk, surrounded by vast marshes called the Pinsk Marshes, stands on the banks of the Pina, a branch of the Pripet, 752 miles south-south-

west of St Petersburg, lat. 52° 7' N., long. 26° 6' E. It was founded in the 12th c., was conquered by the Prince of Lithuania in 1320, was annexed, together with Lithuania, to Poland in 1569, and came at last into the possession of Russia in 1795. The trade of P., chiefly transit, has increased, especially since the opening of the Oghinsky Canal, which connects the Dnieper and the Black Sea with the Niemen and the Baltic Sea. A very considerable number of ships and barges enter and clear the port. They are laden principally with salt, corn, hemp-seed, iron, glass, tar, tallow, wool, tobacco, and timber. These goods are forwarded to the west and north-west, being conveyed by land to Austria, and by water to Kovno, Königsberg, Danzig, and Warsaw. The manufacturing activity of the town is not great. Pop. 16,160, three-fourths of whom are Jews.

PINT, a measure of capacity used both for liquids and dry goods, and equivalent to the eighth part of a Gallon (q. v.), or 34·65925 cubic inches. The Scotch pint, still in use, though superseded as a legal measure by the imperial pint, is equivalent to 3·00651 imperial pints.

PINTA'DO. See GUINEA FOWL.

PINTAIL, or **PINTAIL DUCK** (*Dafila*), a genus of ducks, of the section with the hind-toe destitute of membrane. The bill is without tubercle at the base, narrow, with laminae not projecting beyond the margin. The tail of the male is long, and tapers to a point.—The COMMON P. (*D. acuta*) is a handsome bird, rather longer in shape than most

Pintail Duck (*Dafila acuta*).

of the ducks; the neck also longer and more slender. It is about equal in size to the mallard. The head is brown, with a white longitudinal line on each side extending down the neck; the back and sides marked with waving lines of black and grayish-white; the lower parts white; the elongated central tail-feathers black. It is a native of all the northern parts of the world, migrating southwards in winter, and a regular visitant of many parts of the British coasts. It also frequents fresh-water lakes and ponds, and is common in winter in the valley of the Mississippi. Its winter range extends southwards to the Mediterranean and the Gulf of Mexico, and even to Africa and the West Indian Islands. Its flight is very rapid and noiseless. It is very much esteemed for the table. It has been tamed, and has bred in confinement.

PIOMBINO, a principality now incorporated in the kingdom of Italy, lies along the Italian coast opposite the island of Elba, the greater part of which belonged to it. Its extent was about 132 English square miles; and its population, previous

to its incorporation with the rest of Italy, about 25,000. P. was originally a fief of the empire, and, at the end of the 14th c., came into the possession of the family of Appiani, which, after ruling it for nearly 300 years, made way for a new dynasty, the family of Buoncompagni. This latter dynasty was mostly under the suzerainty of the neighbouring states of Sardinia and Naples alternately. In 1801, the Buoncompagni family were expelled by Napoleon, and the principality given to his sister Elisa, the wife of Felice, Prince Baciocchi; but the latter was ejected, and the old dynasty restored, by the Congress of Vienna; the principality being then put under the suzerainty of Tuscany, whose grand-duke indemnified the Buoncompagni for their loss of sovereignty. It is now a part of the province of Grosseto, in the kingdom of Italy. The strait between P. and Elba is called the 'Channel of Piombino.'

PIONEER, a military labourer employed to form roads, dig trenches, and make bridges as an army advances; and to preserve cleanliness in the camp when it halts. Formerly, the pioneers were ordinary labourers of the country in which the army was, impressed for military purposes; but now such persons are only brought in as auxiliaries, a few men being attached to every corps as a permanent body of pioneers. In the British army, one man is selected, for his intelligence, from every company. These pioneers march at the head of the regiment, and the senior among them commands as corporal. Instead of a musket, each man carries a saw-backed sword, which is at once tool and weapon. Each bears also an axe and two gun-spikes, other necessary tools being distributed among them. There is something rather conflicting between the functions of the pioneers and those of the engineer force.

PIOTRKOW, a town of Poland, in the government of Warsaw, and 91 miles south-west of the city of that name, close to the Warsaw and Vienna Railway. It is known to have existed in the 15th c.; but it is now a decaying town, carrying on no prominent and special branches of trade or manufacture. Pop. about 14,000.

PIOZZI, MRS (*née* HESTER LYNCH SALUSBURY), who cannot be forgotten while the great Dr Samuel Johnson continues to be remembered, was the daughter of John Salusbury, Esq., of Bodvel, in Caernarvonshire, where she was born in the year 1739. Early introduced into the fashionable world of London, she charmed by her beauty and her lively manners; and, in 1763, was married to Mr Henry Thrale, a rich brewer, with a recognised position in society, and, at the time, one of the members for the borough of Southwark. Her acquaintance with Dr Johnson, which speedily became an intimacy of the closest and most affectionate kind, began shortly after. Of all Johnson's many friendships, this was perhaps, in certain essential respects, the most valuable to him. To Johnson, widowed and alone, and subject, as he had been throughout, to accessions of a frightful gloomy hypochondria, which made life at times to him an almost intolerable burden, the society of Mrs Thrale, and of the circle which she gathered round her, was a source of incalculable solace. Mrs Thrale in particular, with her warm heart, and bright womanly intelligence, was always a comforting presence; and her unfailing cheerfulness and vivacity enlivened for him many an otherwise cloudy hour. Her married life, though prosperous, was not an eminently happy one, Mr Henry Thrale, though always a pleasant and kindly gentleman, being no miracle of conjugal virtue. If Johnson owed her much it may be

surmised that the benefit was in some sort reciprocal, and that, by her affectionate reverence and solicitude for her sage, she a little consoled herself for the gentlemanly indifference of her husband. On the death, in 1781, of her husband, Mrs Thräle retired with her four daughters to Bath, where, in 1784, she married Mr Gabriel Piozzi, an Italian teacher of music. This *mésalliance*—as it was held—was deeply censured by all her friends and so unreasonably excited the ire of Dr Johnson in particular, that a rupture of friendly relations was the result. In the correspondence between them on the subject, it must be admitted the lady has much the better of the philosopher, whose tone of unmannerly rudeness gives some countenance to the good-natured suspicion of his friends, that he had an eye to the widow himself. Though the feud was ostensibly healed, the friends never again met; Mrs P. leaving England for Italy with her husband, and Dr Johnson dying soon after. Some little time subsequent to his death, she published an octavo volume, entitled *Anecdotes of Dr Samuel Johnson during the last Twenty Years of his Life*, in which it seemed to the indignant Boswell and others, that her main intention was to take her little feminine revenge on the deceased for his outrage in the matter of Piozzi. This work she supplemented in 1788 by a collection of *Letters to and from Dr Samuel Johnson*, in 2 vols. 8vo. Of works more properly her own, may be mentioned, *Observations and Reflections made in the course of a Journey through France, Italy, and Germany* (2 vols. 8vo, 1789); *British Synonymy, or an Attempt at regulating the Choice of Words in Familiar Conversation* (2 vols. 8vo, 1794); and *Retrospection, or a Review of the most striking and important Events, Characters, Situations, and their Consequences, which the last Eighteen Hundred Years have presented to the View of Mankind* (2 vols. 4to, 1801)—books long since utterly forgotten, if ever they were at all read and remembered. Having survived her second husband, her own celebrity, and almost in some sort that of the great Dr Johnson, with whom her name remains indissolubly connected, Mrs P. died at Clifton, near Bristol, on the 2d May 1821.

PIPA, a genus of batrachians, in general form resembling toads, and characterised by the very broad and triangular head, the sides of which are destitute of the glands (*parotoids*) so large in the true toads; the eyes small, and situated near the margin of the lower jaw; sternum arciferous; the ear concealed; the tongue merely rudimentary; the jaws destitute of teeth; the fore-feet not webbed, but divided into four fingers, each of which divides at the extremity into four small points, these, again, being minutely divided in a similar manner; the hind-feet five-toed and completely webbed; the larynx of the male extremely large—a triangular bony box, within which are two small movable bones for occasionally closing the entrance of the bronchi; the back of the female furnished with numerous cells or pouches, in which the eggs are hatched, and the young undergo all their transformations till they have attained a form similar to that of their parents. These characters are so remarkable as to make the creatures of this genus objects of peculiar interest, but particularly the mode of rearing the young. It was at first supposed that the young were produced in some unusual way in the cells from which they were seen finally to emerge; but this is not the case. The eggs are deposited by the female in the ordinary manner, and are carefully placed by the male in the cells of her back, which close over them. When the young are ready to use their limbs, they struggle out of the cells, to which they never afterwards

return. The best-known species of P. is that commonly called the Surinam Toad (*P. Surinamensis*), a native of Guiana and other warm parts of continental America, where it inhabits swamps and ditches, and is occasionally found in damp and dirty corners of houses. It is sometimes seven inches long; its colour is brownish-olive above, whitish below; the skin covered with small hard granules, mingled with occasional horny tubercles. The whole aspect of the creature is peculiarly hideous.

PIP. See SUPPLEMENT, in Vol. X., page 686.

PIPE, a measure of quantity commonly employed in Portugal, Spain, France, and in some other countries which trade with these. It is used almost exclusively for wine and oil, and has a particular value for almost each locality. The pipe is called in England a butt, and is equal to two hogsheds, or half a tun. The pipe of Oporto is larger than those of Lisbon and of Spain in the proportion of 93 to 76. There are three different measures of this name in France; and there was formerly a pipe, a measure of capacity for dry goods, in use by the Bretons. But the pipe in England varies with the description of wine it contains: a pipe of port contains 114 imperial gallons; of sherry, 108 imperial gallons; and of madeira, 92 imperial gallons; while the common English pipe contains 126 wine gallons, or 105 imperial gallons nearly.

PIPECLAY is a fine Clay (q. v.), free from iron and other impurities, having a grayish-white colour, a greasy feel, and an earthy fracture. It adheres strongly to the tongue, and is very plastic, tenacious, and infusible. It is used for the manufacture of tobacco-pipes and white pottery. The localities where it is chiefly obtained are Devonshire, and the Trough of Poole in Dorsetshire. It is also found in various places in France, Belgium, and Germany.

PIPE-FISH (*Syngnathus*), a genus of osseous fishes of the order *Lophobranchii* (q. v.), and of the family *Syngnathidae*. In this family the form is elongated, there is little flesh, and the body is almost covered with partially ossified plates; the head is long; the jaws are elongated so as to form a tubular snout—whence the names P. and *Syngnathus* (Gr. *syn*, together; and *gnathos*, a jaw); and the males have pouches, variously situated, in which they receive the eggs of their mate, and carry them till they are hatched. The family *Syngnathidae* is sometimes restricted to those in which the egg-pouch

Pipe-Fish (*Syngnathus acus*).

of the males is on the tail, and is open throughout its whole length, and the tail is not prehensile. Thus restricted, it contains a number of genera, of which one only, *Syngnathus*, is British.—One of the most common British species is the GREAT P. (*Syngnathus acus*), which is sometimes found in deep water, and sometimes at low tide among the sea-weed in rock-pools. The specimens commonly seen are from 1 foot to 16 inches in length; but this fish is said to attain

▲ length of 2 or 3 feet. Its food, and that of the other species, is believed to consist of small marine animals and the eggs of fishes; and it may be seen slowly moving about, with curious contortions, poking its long snout into every crevice in search of food, and sometimes assuming a vertical position with the head downwards, poking into or stirring the sand. This and the other pipe-fishes shew great affection for their young, which are believed to return, on the appearance of danger, to the pouch of their male parent, after they have begun to leave it, and to swim about in the sea.

The name P. is sometimes also given to the fishes forming the family *Pistulariæ* (q. v.), or Flute-mouths, sometimes called *Pipe-mouths*.

PIPERACEÆ, a natural order of exogenous plants, natives almost exclusively of the hottest parts of the globe, particularly of Asia and America. None of them found in cold regions. About 600 species are known, to most of which the name PEPPER is sometimes given, although some are also known by other names, particularly those of which the fruit is not used as a spice, but of which some part is employed for some other purpose, as Betel, Cubebs, Matico, and Ava. See these heads. But Pepper (q. v.) is the most important product of the order. Of the P., a few are almost trees; but they are generally shrubs or herbaceous plants, often climbing. They have jointed stems; opposite whorled or alternate leaves, with or without stipules, and insignificant greenish flowers in slender spikes, unisexual or hermaphrodite, the different kinds generally mingled in the same spike; the flowers without calyx or corolla, but each with a bract, the stamens 2—6, the ovary with one cell and one ovule, and crowned with one or three stigmas; the fruit somewhat succulent, containing one seed.

PIPERINE ($C_{17}H_{19}NO_3$) is an alkaloid possessing very weak basic properties, which is found in the Pepper tribe. It may be obtained by heating powdered pepper with alcohol, which extracts the piperine and some resinous matter, which may be removed by digestion in a solution of potash. It occurs in colourless well-formed prisms, which are insoluble in cold water, but dissolve readily in alcohol and ether. According to Miller, piperine 'has an acrid taste, resembling that of pepper;' while Goup-Besanez asserts that 'it is devoid of odour or taste, and that, consequently, the well-known properties of pepper are not dependent on it.' On heating piperine with soda-lime, a remarkable oily base, *Piperidine* ($C_8H_{11}N$), is obtained, with a pungent odour, resembling both that of ammonia and pepper.

PIPES, or TUBES, are made of various materials and for various purposes. Thus, we have draining-pipes for agricultural and sanitary purposes, made of earthenware, wood, and metal; pipes of various kinds of metals for a great variety of purposes, and Tobacco-pipes (q. v.) of various materials. Formerly, wooden pipes were extensively used for conveying water and for draining; but so great an improvement has been effected of late years in the manufacture of metal and earthenware pipes, that they have now become exceedingly rare, and will soon disappear. For agricultural purposes, *drain-tiles* are made of ordinary brick-clay; and owing to the use of machinery in their manufacture, they are produced very rapidly and cheaply. They are of various sizes, but the most general is 15 inches in length by $2\frac{1}{2}$ inches diameter. The operation of the drain-tile machine is to squeeze a continuous length of soft plastic clay through a ring-shape orifice, the centre of which is occupied by a core or mandrel of the size of the hollow part of the

pipe. Another arrangement of the machine is to cut the pipe to the proper lengths as it passes through, and by means of a travelling-table, to carry them forward to be removed to the sheds, where they are dried, previous to being burned in the kilns.

Within the last twenty years, earthenware pipes have been made of almost every size, from an inch or two in diameter up to the enormous size of fifty-four inches. They are usually made of fire-clay, and are glazed like common pottery. See POTTERY. They are wider at one end, so as to form a socket, as in fig. 1, to receive the end of another, and thus form a continuous tube. These are greatly used for the drainage of houses, and for sewerage, for which

Fig. 1.

they are admirably adapted: the inner surface being glazed as well as the outer, offers no resistance to sedimentary matters, which are consequently carried away readily. These pipes are of such great strength, that many small towns in England are now sewered with them almost entirely. Another kind has been introduced for chimney flues. They are also made of fire-clay, but unglazed externally, and so thick, that there is little fear of breaking. They are placed one on another, and are built into the walls of houses, instead of the ordinary chimneys, and in this way save much labour in building, and afford a much more effective, and easily cleaned flue (fig. 2). *Caoutchouc vulcanised* and *gutta percha* are also extensively used for making pipes for a variety of purposes, their flexibility rendering them very useful. *Leathern pipes* are used chiefly for the conveyance of water temporarily, as in the case of fire-engines: they are generally called *hose*. Metal pipes are made of iron, lead, tin, or an alloy of tin and lead, copper, brass, &c. Iron pipes are usually cast, and the manufacture of such pipes has become of enormous extent, in consequence of the vast works, by which almost all large towns in this kingdom and in many foreign states are now supplied with water and gas, the pipes for which are largely exported from Great Britain. A great proportion of the trade in cast-iron pipes is carried on in Scotland. The water-works which supply the great towns of Lancashire have nearly all been furnished with pipes from Scotland; and the magnitude of the supply can be best understood when it is known that for the Rivington Pike Works, which supply Liverpool, upwards of twenty miles of iron pipes, nearly four feet in diameter, are required. It would be impossible to make a correct estimate, but it has been stated, with great reason for belief, that in Great Britain the gas and water-pipes laid and in use exceed half a million of miles in length.

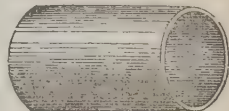

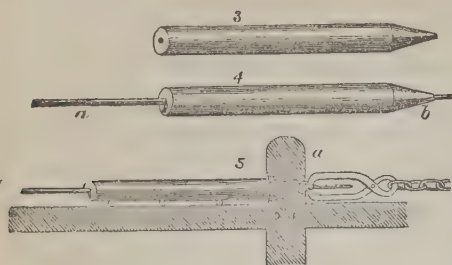

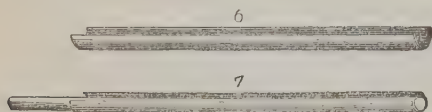

Fig. 2.

Pipes made from the ductile metals, such as brass, copper, and tin, are made by first casting an ingot of the metal into the shape shewn in fig. 3, with a hole through its length of the same diameter the bore of the pipe is intended to have. Into this is placed an iron rod, called the mandrel (a, fig. 4), which exactly fits, and which projects slightly at the tapered end (b, fig. 4). It is then

brought to the drawing-table, and here the small end with its projecting mandrel is put into a funnel-shaped hole, drilled through a steel post (a, fig. 5),

so as to allow the point to be gripped on the other side by a pair of pincers, at the end of a strong chain; the machine-power is then applied to the other end of the chain, and the soft metal and its mandrel are drawn through, the former being extended equally over the surface of the latter, which is then removed, and the length of pipe is complete. Some metals require repeated drawing through holes, getting gradually smaller, and have to be softened or annealed at intervals, as the metal hardens under repeated drawing. In this way, brass, copper, tin, and pewter pipes are made; and a patent has just been taken out for making steel ones; but lead pipes are made of great lengths by squeezing the soft metal through a hole in a steel plate in which there is a fixed core or mandrel projecting, which forms and regulates the size of the bore of the pipe. Pipes are also made from copper, brass, and malleable iron by rolling out narrow strips of metal, and then passing them successively through rollers, which are deeply grooved, and which turn up the edges (fig. 6). A mandrel is then laid in it, as in fig. 7, and it is next passed through double-grooved rollers, which turn the edges in, and thus form a complete tube round the

mandrel. The edges, however, require soldering or welding, if of iron. All boiler tubes used to be made in this way; but the method of drawing has lately been so much improved, that copper and brass pipes, or tubes, as they are frequently called, are now drawn of considerable thickness and diameter.

PIPE-STICKS. It is usual to call the wooden tubes used for some tobacco-pipes by this name; and unimportant as it may at first sight appear what the tube is made of, there is great difference of taste in this respect; and great care is taken by some smokers to get what they consider the choicest material. Perhaps the most prized are the Agriot or Cherry pipe-sticks of Austria. These are the young stems of the Mahaleb Cherry (*Prunus Mahaleb*), which is extensively grown for the purpose in the environs of Vienna. An astonishing amount of care is bestowed on the cultivation of these shrubs, which are all raised from seed. When the seedlings are two years old, they are each planted in a small pot, and as they continue to grow, every attempt at branching is stopped by removing the bud. As they increase in size from year to year, they are shifted to larger pots or boxes, and great care is taken to turn them round almost daily, so that every part is

equally exposed to the sun. When they have attained a sufficient height, they are allowed to form a small bushy head, and continue to receive the same attention in daily turning, &c., until they are thick enough in the stem. They are then taken up, and the roots and branches removed, and the stem put by to season. Afterwards, they are bored through, and are ready for use. These pipe-sticks have an agreeable odour, and are covered with a reddish-brown bark, which is retained. Sometimes they are five feet in length, and as smooth and straight as if turned. When of such a length, they command high prices. In Hungary, pipe-sticks made from the stems of the Mock Orange (*Philadelphus coronarius*) are much used; and the jessamine sticks of Turkey are in great esteem in all countries. Orange and lemon-trees and ebony are also used. The chief recommendation of these materials seems to be in the power of the wood to absorb the oil produced in smoking tobacco, and consequently to render the smoke less acrid. See TOBACCO-PIPES.

PIPI, the name given to the ripe pods of *Cesalpinia Papai* (see *CESALPINIA*), which are used in tanning, and are not unfrequently imported along with *Dividivi* (q. v.), and sometimes separately, but not to any considerable extent, being very inferior to *dividivi*. They are easily distinguished from the pods of *dividivi*, not being curved as they are, but straight.

PIPING CROW. See *BARITAE*.

PIPIT, TITLING, or TITLARK (*Anthus*), a genus of birds included by Linnaeus among Larks (*Alauda*); but now regarded as forming even a distinct family, *Anthidae*, which is ranked among the *Dentirostres*, whilst the lark family (*Alaudidae*) is ranked among the *Conirostres*. The bill is more slender than in larks; the tips of the mandibles slightly bent downwards and notched. The hind-claw is long, although not so long as in larks, and more or less curved. The plumage resembles that of larks; in habits and motion of the tail, there is a greater resemblance to wagtails. The bill is not strong enough for feeding on grain or hard seeds, and insects and worms are the principal food of pipits. The most common British species is the MEADOW P., COMMON TITLARK, or TITLING (*A. pratensis*), familiarly known in many parts of England and of Scotland as the Moss-cheeper. It is found in almost all parts of Europe, and the north of Asia, in Western India, in Japan, and in Iceland. It is a small bird, its colour brown of various shades. It frequents heaths, mosses, and pastures; and usually makes its nest on a grassy bank, or beside a tuft of grass or heath. Its song is weak and plaintive, and it generally sings in the air. It is gregarious in winter. The cuckoo is said to deposit its egg more frequently in the nest of the Meadow P. than in that of any other British bird.—A rather larger British species is the TREE P., or FIELD TITLING, which has a shorter claw, and perches on trees, frequenting enclosed and wooded districts. It is a summer visitant of Britain, and most common in the south of England. It occurs in most parts of Europe, in Asia, and the north of Africa.—The ROCK P., or SEA TITLING (*A. petrosus*), is to be found on the shores of all parts of Britain and Ireland. It is rather larger than the Tree P., and has a long curved hind-claw. It feeds chiefly on small marine animals, seeking its food close to the edge of the retiring tide.

PIPPIN (so called probably because raised from the pip, or seed), a name given to many varieties of apple, among which are some of the finest in cultivation, as the *Golden P.*, *Ribston P.*, &c. The

Ribston P. was long supposed to be an originally English variety, produced at Ribston Hall in Yorkshire, but it is proved to have been introduced from Normandy in the beginning of the 18th century.

PIQUÉ WORK, a very fine kind of inlaying with gold, silver, and other costly materials; it is, in fact, a kind of Buhl-work (q. v.), carried out on a very minute scale. It is only applied to articles of small size, such as snuff-boxes, card-cases, and similar articles.

PIQUET is a small body of men posted at some point beyond the general line of the army or corps, for the purpose of observing the motions of an enemy, or giving timely notice in case of any attack. Piquets are either *outlying* or *inlying*.

PIQUET, a game of cards played between two persons with thirty-two cards—viz., the four honours, and the highest four plain cards of each suit. The cards are shuffled and cut as in whist, and then dealt, two by two, till each player has twelve; and the remaining eight, called the *talon*, or stock, are then laid on the table. The first player must then discard from one to five of his cards, replacing them with a similar number from the talon; and after him, the younger hand may discard if he pleases, similarly making up his proper number from the remaining cards of the talon. The player who first scores 100 wins the game, and the score is made up by reckoning in the following order—*carte-blanche*, the point, the sequence, the quatorze, the cards, and the capot. *Carte-blanche* is a hand of twelve plain cards, and counts ten for the player who possesses it. The point is the greatest number of cards in any suit, or, if the players are equal in this respect, that which is highest in value (the ace counting eleven, each court-card ten, and the plain cards according to the number of pips), and counts a number equal to the number of cards in the suit. The sequence is a regular succession of three or more cards in one suit, and the highest sequence (i. e., the one containing the greatest number of cards, or if the players have sequences equal in this respect, the one of the two which begins with the highest card), if of three cards, counts three; of four cards, four; of five cards, fifteen; of six cards, sixteen, &c. The quatorze is a set of four equal cards (not lower than tens), as four aces, four queens, &c., and the highest quatorze counts fourteen for its holder; but should neither player have a quatorze, then the highest set of three is counted instead, but it reckons only three. The possessor of the highest sequence or the highest quatorze also counts all inferior sequences and quatorzes (including sets of three); while his opponent's sequences and quatorzes go for nothing. The first player reckons his points, and plays a card; the dealer then reckons his points, and follows his opponent's lead, and cards are laid and tricks are taken as in any ordinary card-game. Each player counts one for every card he leads, and the taker of the trick (if second player) counts one for it; the possessor of the greater number of tricks counting ten in addition (the 'cards'), or if he takes all the tricks, he counts forty in addition (the 'capot'). If one player counts thirty—i. e., 29 by his various points, and one for the card he leads, before his adversary has counted anything, he at once doubles his score, reckoning sixty instead of thirty (this is called the 'pique'); and should his score reach thirty before he plays a card, or his adversary begins to count, he mounts at once to ninety (the 're-pique').

PIRACY is robbery on the high sea, and is an offence against the law of nations. It is a crime not against any particular state, but against all

mankind, and may be punished in the competent tribunal of any country where the offender may be found, or into which he may be carried, although committed on board a foreign vessel on the high seas. It is of the essence of piracy that the pirate has no commission from a sovereign state, or from the belligerent state at war with another. Pirates being the common enemies of all mankind, and all nations having an equal interest in their apprehension and punishment, they may be lawfully captured on the high seas by the armed vessels of any particular state, and brought within its territorial jurisdiction for trial in its tribunals. The African slave-trade was not considered piracy by the law of nations; but the municipal laws of the United Kingdom and of the United States by statute declared it to be so; and since the treaty of 1841 with Great Britain, it is also declared to be so by Austria Prussia, and Russia.

PIRÆUS (Gr. *Peiræus*), the principal harbour both of ancient and modern Athens (q. v.), and situated 5 miles S. W. of that city. Only a few traces remain of the long walls which formerly united it and Munychia with the capital city. The modern P., which has sprung up since 1835, is a regularly laid-out town, with some good houses and shops, and is connected with Athens by the first railway of Greece, which was opened in 1869. The harbour, called also Porto Leone or Drakoni, is both safe and deep; but the entrance is narrow; about 1000 foreign vessels visit it, and 10,000 steamers and sailing-vessels, engaged in the coasting-trade, enter and clear annually. Pop. (1870), 11,047; (1879) 21,055.

PIRANO, a seaport of Austria, in the mark-grafdom of Istria, stands on a peninsula in the bay of Largone, 15 miles south-west of Trieste. It contains an old castle, has a port and several dock-yards, commodious roads, in which large vessels find safe anchorage, and is the seat of considerable trade and commerce. Among its more important edifices are an interesting Gothic church, a town-house, and a Minorite convent, with a number of good pictures. Wine and oil are made in considerable quantities, and there are salt-works in the neighbourhood, which produce upwards of 330,000 cwts. of salt annually. Pop. 9200.

PIRAYA, or **PIRAI**, the name given in Guiana to *Serrasalmo piraya*, and other species of *Serrasalmo*, a genus of fishes of the family *Characinidae*, regarded by many as a section of *Salmonidae* (q. v.). The fishes of this genus, of which numerous species inhabit the rivers and other fresh waters of tropical South America, have a compressed and deep body, the belly keeled and serrated with a double row of hard serratures. They are extremely voracious fishes, and not only consume with great rapidity dead carcases thrown into the water, but attack living creatures very much larger than themselves, biting off the fins of large fishes, and then devouring them at leisure, often mutilating ducks and geese by depriving them of their feet, and venturing to attack even oxen and human beings. The latter, however, make reprisals on them, and find them very good food. *Serrasalmo piraya* seldom exceeds 10 or 12 inches in length, but some of the species attain a considerably larger size. Some of them are very brilliantly coloured. The Indians use the teeth for sharpening the arrows, made of the very hard ribs of palm-leaves, which they use for their blow-pipes, and which they sharpen to a very fine point by drawing them across a piraya's jaw, an article with which the Indian of Guiana is always provided; nor does the edge of the teeth soon begin to be worn. Pirayas are readily taken by a baited hook, and almost any

kind of bait will do; but they at once cut through any line, and the line must therefore be cased above the hook in tin-plate. The Indians often shoot them with arrows.

PIRMASENS, a small town of the Bavarian Palatinate, and formerly the chief town of the county of Hanau-Lichtenberg, 22 miles west of Landau. It has 8675 inhabitants, who manufacture shoes and musical instruments.

PIRNA, a small town of Saxony, stands on the left bank of the Elbe, 11 miles by railway south-east of Dresden. It is surmounted by a hill, crowned by a castle, now used as a lunatic asylum, contains a beautiful parish church, and a number of important benevolent institutions. The manufacture of stone-ware employs many hands. Pop. 8410.

PISA, one of the oldest and most beautiful cities of Italy, and, till lately, the capital of the now extinct grand-duchy of Tuscany, is situated in a fruitful valley, on the banks of the river Arno, which intersects the city and is spanned by three noble bridges. P. is situated in $43^{\circ} 43'$ N. lat., and $11^{\circ} 24'$ E. long. The population was, in 1879, 50,374. It has broad, straight, well-paved streets, and several fine squares. Among its 80 churches, the most worthy of notice is the cathedral, or Duomo, begun in 1068, and completed in 1118, with its noble dome, supported by 74 pillars, and its fine paintings, variegated marbles, and painted windows. Near the cathedral stands the round marble belfry known as the Leaning Tower of Pisa, from the circumstance that it deviates about 14 feet from the perpendicular. This celebrated building, which is 180 feet in height, and consists of seven stories divided by rows of columns, and surmounted by a flat roof and an open gallery commanding a splendid view of the surrounding country, was erected in the 12th c. by the German architect Wilhelm of Innsbruck. The Baptistery, or Church of St John, opposite the cathedral, an almost equally remarkable structure, was completed in 1162 by Diotisalvi. The main building, which is circular, and raised on several steps, supports a leaden-roofed dome, having a second dome above it, surmounted by a statue of St John. The beautifully proportioned interior, noted for its wonderful echo, contains a pulpit, which ranks as the greatest masterpiece of Nicola Pisano, various pieces of sculpture, and a large octagonal marble font. The Campo-Santo, or ancient national cemetery, dates from the year 1228, when the Pisans caused earth to be brought from Jerusalem for the graves of the most distinguished citizens of the republic. In 1283, the ground was surrounded by cloisters, the walls of which were adorned by fresco-paintings, now nearly obliterated, although some of these works of art, which are chiefly by Giotto, Veneziano, Orcagni, and Memmi, still retain traces of their original beauty. Among the other public buildings of P., special notice is due to the churches of La Madonna della Spina and San Stefano, both rich in paintings and sculptures, and the latter famous for its organ, the largest in Italy; the grand ducal and Lanfranchi palaces; the Torre della Fame, so called from its being supposed to have been the spot in which Ugolino Gherardesca and his children were starved to death in 1288; the university, founded in 1330, and restored by Cosmo I. de' Medici, which enjoyed a high reputation in the middle ages, and still possesses claims to consideration in its library, botanical garden, observatory, and affiliated schools and art collections, &c. The population of P., which, in the 13th c., amounted to 150,000, had fallen, in the present century, to less than one-sixth of that number; but of late years, trade and

industrial arts have made a rapid advance, and the population has increased in proportion. In the neighbourhood of P., at the foot of San Giuliano, lie the mineral baths, whose fame was known to Pliny, and which continued through the middle ages to attract sufferers from every part of Italy. The waters, which are rich in carbonic acid and chloride of sodium, are found efficacious in various arthritic and rheumatic affections.

History.—Ancient P., like other Etruscan cities subject to Rome, retained its municipal government, and enjoyed an almost unlimited freedom while nominally under Roman protection; but, on the decline of the imperial power, it was compelled to submit in turn to the various transalpine nations who successively overran Northern Italy. Early in the 11th c., P. had risen to the rank of a powerful republic, whose sway included the then fertile district known as the Maremma di Lerici, and which yielded little more than nominal homage to its suzerain lords, the emperors of Germany. Throughout the 11th c., P. was at the height of its prosperity, and to this period belong most of the splendid monuments of art that still adorn the city. Its troops took part in all the great events of the Holy Land; and its fleet in turn gave aid to the pope in Southern Italy, to the emperor in Northern France, chastised the Moors, and exacted its own terms from the Eastern emperors. In their wars with the Saracens of Sardinia, the Pisans had conquered Sardinia, Corsica, and the Balearic Islands, and for a time maintained their ground against their hereditary enemies, the Genoese; but having sided with the Ghibellines in the long wars which desolated the empire, P. suffered severely at the hands of the victorious Guelphic party. Indeed, the rivalry of the Guelphic cities of Florence, Lucca, and Siena, nearly brought P. to the brink of ruin at the close of the 13th c.; and after struggling for more than a hundred years against external foes and the internal dissensions between the democratic mob and the Ghibelline nobles, without losing their character for indomitable valour, the Pisans finally threw themselves under the protection of Galeazzo Visconti of Milan. The son of the latter sold the Pisan territory to their greatest enemies, the Florentines, from whose tyrannical rule it was for a time relieved by Charles VIII. of France, who, in 1494, accepted the protectorate of the city. When the French left Italy, the old struggle was renewed; and after offering a desperate resistance, the Pisans, in 1509, were compelled by hunger to surrender the city to the Florentine army besieging the walls. The most influential families, as formerly in 1406, when P. first lost her independence, emigrated. P., with the rest of Tuscany, became part of the kingdom of Italy in 1860. Since 1868 P. has given its name to one of the 69 provinces, with a pop. (1881) of 283,269.

PISA, COUNCIL OF, one of the councils commonly reputed by Roman Catholics as œcumenical or general, although some, especially of the Ultramontane (q. v.) school, do not look upon it as such. It was assembled in the time of the great Western Schism, for the purpose of restoring the peace of the church, and the unity which had been interrupted by the rival claims of two competitors for the papacy. The history of this rival claim will be found under the head **WESTERN SCHISM**. For our present purpose, it is enough to state that the adherents of both the claimants of the see of Rome—those of Gregory XII., as well as those of Benedict—agreed on the necessity of a general council, as the only means of putting an end to the schism; and the rival popes having themselves either evaded or declined the demand, the cardinals of both united in issuing letters of convocation, and in summoning

both the claimants to the council so convened. Neither of them complied with the citation; but the council proceeded, nevertheless, to examine and deliberate upon the cause. It was opened at Pisa, March 25, 1409, there being present 22 cardinals, 4 patriarchs, 12 archbishops, 80 bishops, together with representatives of 12 archbishops and 102 bishops, and a vast body of abbots, doctors in theology, and other eminent ecclesiastics. Of the proceedings, it will be enough to say, that after a formal citation of the rival popes to appear within a stated period, the council, on the expiration of that period, proceeded to declare them contumacious, and to examine their respective claims as though they had appeared. The result, after a protracted inquiry, was a decree in the 13th session by which they were both declared schismatics, and their conduct heretical, and calculated to lead the people from the faith; wherefore, since they had violated the solemn engagements made at their respective elections, they were deposed from the papal dignity, and their followers released from obedience. In the 17th session, the cardinals having first pledged themselves by oath, each, that, if elected, he would continue the sittings of the council, entered into conclave to the number of 24, and unanimously elected Peter Philargi, one of the cardinal priests, and a member of the Franciscan order. He took the name of Alexander V. The council proceeded after his election to pass a number of decrees, for the purpose of giving validity to the acts done on either side during the schism. A vain attempt was made to obtain the submission of the still recusant rivals, and it was resolved that a new council should be held within three years. The authority of this council, like that of the Council of Constance, is alleged, on the Gallican side, as establishing the superiority of a general council over the pope. But the Ultramontanes reply that both these councils, and also that of Basel, must be regarded as abnormal assemblies, called to meet the special emergency of a disputed succession and of a doubtful pope, and that these principles cannot by any means be applied to the ordinary circumstances of the church, or form a precedent by which to estimate the normal relations between a pope whose title is certain and undisputed, and a general council regularly assembled at a time of peace, and in the ordinary circumstances of the church. It cannot be doubted, nevertheless, that the spirit of the fathers of Pisa was the same which ran through the succeeding assemblies of Constance and Basel, and found its permanent representation in the Gallicanism (see GALICAN CHURCH) of later centuries.

PISCATAQUA, a river about 80 miles in length, which forms the southern part of the boundary between Maine and New Hampshire, U.S., and empties itself into the Atlantic, forming at its mouth the excellent harbour of Portsmouth.

PISCICULTURE, or **FISH-CULTURE**, the breeding and rearing of fishes, in order to the increase of the supply for food. Hitherto, it has been almost entirely limited to fresh-water fishes; nothing having been done as to sea-fishes but by legislation—chiefly in the case of the herring—to prevent the destruction of the very young fish, and that not, apparently, to much advantage. Ponds for sea-fishes have, indeed, been sometimes constructed, advantage being taken of natural circumstances favourable for the purpose; the ancient Romans had such ponds, and some have been made on different parts of the British coast; fishes being caught in the open sea and placed in them to be fed and fattened for the table. Such ponds, however, are of little real utility. That the Romans

succeeded in keeping sea-fishes in fresh-water ponds, as has been asserted, must be regarded as mere fable, or as an exaggeration, founded on the power which a few fishes have of adapting themselves both to fresh and salt water. But it may be doubted if in modern times sufficient advantage has been taken of this power.

Ponds for fresh-water fishes have been common from a very remote antiquity. It appears from Isaiah, xix. 10, that they were used in ancient Egypt. In the times of Roman luxury, almost every wealthy citizen had fish-ponds. The Chinese have long bestowed more attention on pisciculture than any other nation, and with them it is truly a branch of economy, tending to the increase of the supply of food and of the national wealth; not merely, as it seems to have been among the Romans, an appliance of the luxury of the great. In some countries of modern Europe, this branch of pisciculture is also prosecuted to a very considerable extent, particularly in Germany and Sweden, and of late years in France, in order to the supply of fish for the market. In Britain, it has never been systematically prosecuted, or for any important purpose; the country-seats of the nobility and gentry being, indeed, generally provided with fish-ponds, but in most cases rather as ornamental waters than for use. In the northern parts of Britain, trout, perch, and pike are almost the only fish kept in ponds; in England, they are often stocked with carp and tench, and are turned to much better account than in Scotland. In Germany, ponds carefully attended to are found very productive and remunerative. There can be no doubt that in Britain, also, many a piece of land at present very worthless, might easily be converted into a pond, and made to yield large quantities of excellent fish; but such a thing seems almost never to be thought of.

In the construction of ponds, or *stews*, for fish, it is recommended to have, if possible, a succession of three ponds on the same rivulet, with sluices, by which they can be dried, so that the fish may be easily taken when required, the different ponds being in part intended for fish of different ages. But all this must be very much regulated by local circumstances. It is of more importance to note that the margins should be shallow, so that there may be abundance of reeds and other water-plants, and that only a small part of the pond should be too deep for the growth of pond-weeds (*Potamogeton*). Much depends on the soil of the neighbourhood as to the supply of food, and consequently the growth of fish and productiveness of the pond. Trees overhanging the pond are not desirable; the decomposition of their fallen leaves being injurious to fish. The growth of weeds is more to be encouraged in ponds for carp and tench than in those for perch or trout. A stony bottom is very advantageous to perch and trout ponds. Ponds for pike must be larger than is necessary for any other fish known to British pisciculture: an extent of at least six acres is desirable. A nursery for minnows may be established with great advantage in connection with a fish-pond, as they afford most acceptable food to perch, pike, and trout. But in a pond where carp and tench are expected to spawn, the presence of minnows is very undesirable. It is often impossible to provide a pond with a place suitable for the spawning of trout, for which a gravelly stream with a quick current is necessary; but for perch, pike, carp, or tench, the pond itself is sufficient, and the stock once introduced is kept up without replenishing. Indeed, it is recommended that a pond stocked with carp should also be stocked with pike, that the excessive multiplication of the carp may be checked,

which would otherwise prevent the fish from growing rapidly or to a good size.

The greatest improvement in pisciculture, and a most important branch of it, to which the term is often restricted, is the breeding of fish in artificial breeding-places, from which not only ponds but rivers may be stocked; or the art of fecundating and hatching fish-eggs, and feeding and protecting the young animals till they are of an age to secure their own food, and protect themselves from their numerous enemies. As at present conducted, pisciculture has become in many instances a profitable branch of industry; and the art has been employed in France with great success for replenishing with fishes many of the most important streams that had become barren through over-fishing; in Britain, also, this artificial system has become a profitable adjunct of one or two of our larger salmon-fisheries.

Modern pisciculture is the revival of an old art well known to the ancient Italians, but which had fallen into abeyance for a number of centuries. The art of breeding and fattening fish was well known to the luxurious Romans, and many stories are told about the fanciful flavours which were imparted to such pet fishes as were chosen for the sumptuous banquets of Lucullus, Sergius Orata, and others. The art had doubtless been borrowed from the ingenious Chinese, who are understood to have practised the art of collecting fish-eggs and nursing young fish from a very early period. Fish forms to the Chinese a most important article of diet; and from the extent of the water-territory of China, and the quantities that can be cultivated, it is very cheap. The plan adopted for procuring fish-eggs in China is to skim off the impregnated ova from the surface of the great rivers at the spawning season, which are sold for the purpose of being hatched in canals, paddy-fields, &c.; and all that is necessary to insure a large growth of fish is simply to throw into the water a few yolks of eggs, by which means an incredible quantity of the young fry is saved from destruction. Although all kinds of fish are enormously fecund, it is well known to naturalists that only a small percentage of the eggs ever come to life, and of the young fish, very few ever reach the table as food. So many of the eggs are destroyed by various influences, and so many likewise escape impregnation, that if we are to keep up our fish supplies, pisciculture, or protected breeding becomes absolutely necessary.

Commercial pisciculture, as at present carried on, owes its origin to the French, the art having been first put in practice by M. Remy, a poor fisherman, who gained a living by catching fish in the streams of La Bresse in the Vosges. This re-discovery of the lost art of fish-breeding is understood to have been quite accidental on the part of Remy, although it is thought by some zealous Scotchmen that the Frenchman must have heard of the experiments of Mr Shaw of Drumlanrig, who, for a few years previous to Remy's discovery, had been trying to solve some problems in the natural history of the salmon by means of the artificial system. The art had also been partially revived in Germany about the middle of last century by a gentleman of the name of Jacobi, who practised the artificial breeding of trout. Whether or not Remy had heard of either of these experimenters, it is certain that to him we owe the revival of the art in its larger or commercial sense; the others only used it as an adjunct to their study of the natural history of fishes. In one sense, fish-culture was largely practised in this country long before the discovery by Remy of the system of artificial fecundation—we allude to the fact of there being large numbers of private ponds and stews in which country gentlemen bred fish for the

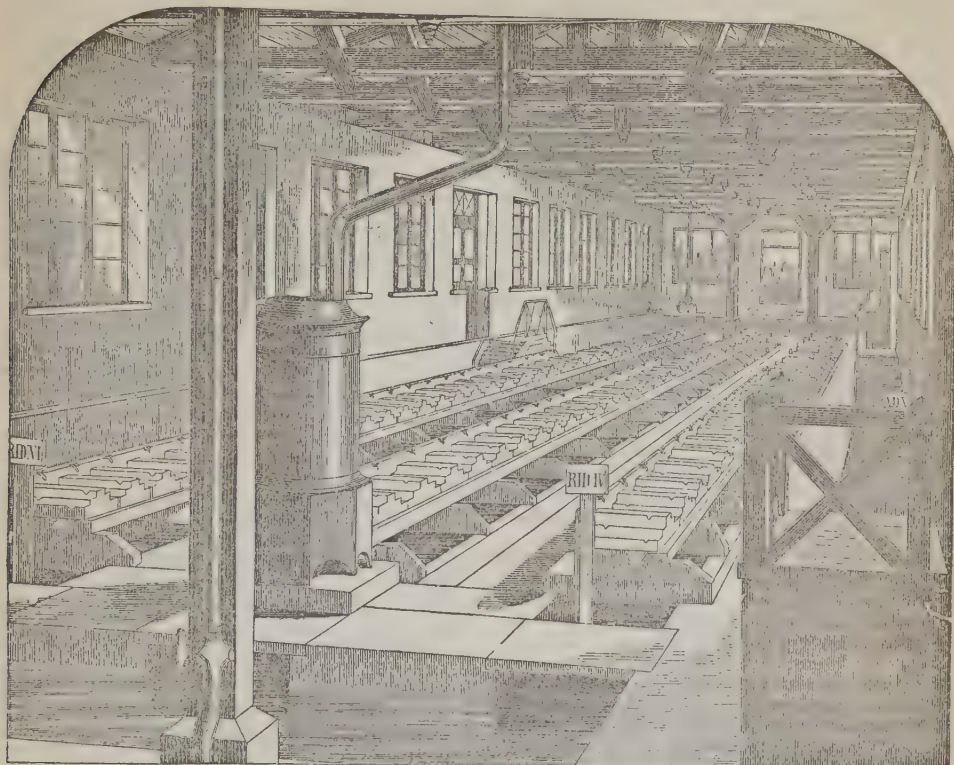

use of their own tables, as well as similar places, attached to monasteries and other religious edifices, in which fish were grown for fast-day uses. The range of fish suited for pond-breeding was very limited; and to render them at all good in flavour, expensive food had to be obtained for them, and they had to be served up accompanied by expensive sauces. It is probable that some of our rarest fishes were introduced into this country during these old monastic times, such as the Lochleven trout, the vendace, &c.

It was the great waste of eggs incidental to the natural system of fish-breeding that led Remy, about 1842, in conjunction with Gehin, a coadjutor whom he assumed as a partner, to try what he could do in the way of reapeopleing the fish-streams of his native district. His plan being at once successful, attracted the favourable notice of many of the French savans, and led to rewards and preferment for Remy; the new art was taken under the protection of the government; and now, after the experience of twenty years, artificial fish-culture has been so perfected in France that there has arisen at Huningue, near Basel, on the Rhine, a gigantic fish-nursery and egg-dépôt for the supply of eggs, and the dissemination of the art both in France and other countries. The place is fitted up specially for this purpose with egg-boxes and reservoirs; and millions of eggs are annually received, and sent to Germany, Spain, England, and other places. A drawing is given on the next page of one of the halls of this interesting establishment.

The course of business at Huningue is as follows: the eggs are chiefly brought from the streams of Switzerland and Germany, and embrace those of the common trout, as well as the Rhine and Danube salmon, and the tender charr or ombre chevalier. People are appointed to capture gravid fish of these various kinds, and, having done so, to communicate the fact to Huningue. An expert is at once sent to deprive these fishes of their spawn, and bring it to the breeding or resting boxes, where it is carefully tended till it is ready to be despatched to some district in want of it. It is, of course, much more convenient to send the eggs than the young fish, as the former, nicely packed among wet moss in little boxes, can be carried to a distance with greater facility. The mode of artificially spawning a salmon is as follows. It should, of course, be ascertained that the spawn is in a perfectly matured state, and that being the case, the salmon is held under water in a large tub, while the hand is gently passed along its abdomen, when, if the ova be ripe, the eggs will flow out like so many pease. The eggs are then carefully washed, and the water is poured off. The male salmon is then handled in a similar way, when the contact of the milt immediately changes the eggs into a brilliant pink colour. After being again washed, they may be ladled out into the breeding-boxes, and left to come to life in due season. The period occupied in hatching is different in different climates. At Stormontfield, where the eggs have no shelter, the usual period is about 135 days; but salmon ova have been known to burst in about half that period, and to yield very healthy fish. Great care is of course necessary in handling the ova. The eggs manipulated at Huningue are all carefully examined on their arrival, when the bad ones are thrown out, and those that are good are counted and entered in a record. The ova are watched with great care, and from day to day all that become addled are removed. The applications for eggs, both from individuals and associations, are always a great deal more numerous than can be supplied; and before second applications can be

entertained, it is necessary for the parties to give a detailed account of how their former efforts succeeded. It may be interesting to note, as regards

the cost of pisciculture at Huningue, that the most expensive fish is the ombre chevalier. Of some species, as many as sixty or seventy per cent. of the

Reception-hall for Fish-eggs at Huningue.

eggs are lost. The general calculation, however, is twelve living fish for a penny.

The total number of all kinds of fishes distributed from Huningue, during the first ten years was upwards of 110 millions! See HUNINGUE.

A very successful effort in pisciculture has been carried out in connection with the salmon-fisheries of the river Tay. At Stormontfield, near Perth, a series of ponds have been constructed, and a range of breeding-boxes laid down capable of receiving 300,000 eggs; and in a large addition to their rental, the proprietors of the Tay fisheries are reaping the reward of their enterprise. The operations at Stormontfield were begun in 1853, and from the end of November till the end of December, 300,000 ova were deposited, and these coming to life in April 1854, remained in the boxes and ponds one half for one year, and the other moiety for two years before they assumed the scales of the smolt, and were seized with the migratory instinct. See SALMON. Every two years since the completion of the ponds, a brood has been obtained, and upwards of one million of salmon have by means of these ponds been added to the fish-stock of the river Tay, so as considerably to enhance the value of the fisheries. Another pond (there was only one originally) has now been added to the suite, for the purpose of holding the second-year parrs, so that a brood of 300,000 will now be obtained annually. At several other places in Scotland, the artificial system is being introduced as an adjunct to the natural breeding resources of different rivers.

The art of pisciculture has also been introduced into Ireland, at the fisheries of Loughs Mask and Carra, by the Messrs Ashworth, who have obtained excellent practical results from their enterprise. These lochs contain an area of water equal to thirty-five acres; and a communication with the sea having been opened, they now teem with salmon; and the proprietors are confident that it is as easy and as profitable to cultivate salmon as sheep. The latest experiment in fish-culture with the salmon consists in the introduction of that fish into Australia and Tasmania. Impregnated eggs carefully packed in ice were sent out in a fast-sailing ship, and were at once transferred to a suitable river, where (1864) they burst into life, with every prospect of becoming naturalised in that vast continent.

A series of piscicultural experiments have been very successfully carried on in the upper waters of the Thames, and the salmon has been bred along with various other fishes, upwards of 120,000 fishes having been added to the stock of the river; but the success of this experiment yet remains to be determined, as it is not certain whether the salmon will be able to penetrate to the sea, in consequence of the lower Thames being used as the sewer of London.

This branch of pisciculture has begun to be prosecuted to some extent in several countries of Europe, and has been deemed of sufficient importance to demand the attention of governments. It is probable that the attention turned to the whole subject of pisciculture, and the example of the transportation of salmon to Australia, may lead to

the introduction of valuable kinds of fishes into waters where they are now unknown. The grayling has thus already been introduced into the Clyde and Tweed. There is no apparent reason why every valuable fresh-water fish of Europe should not be plentiful in Britain.

The French government are now extending the system of artificial culture to some kinds of sea-fish and to many of the larger crustaceans. See OYSTER. At Comacchio (q. v.), on the Adriatic, a curious industry is carried on in the cultivation of eels; and in the Bay of Aiguillon, there is an ancient mussel-farm in which large quantities of that shell-fish are annually grown from the seed, and turned to

very profitable account. There is no practical difficulty, it is said, in rendering an acre of water as productive as an acre of land.

PISCINA, the large basin (or pond) in the Roman *thermae*, containing tepid water, in which the bather might swim.

PISCINA, a shallow stone basin with a drain (usually leading directly to the earth), in Roman Catholic churches, in which the priest washes his hands, and for rinsing the chalice at the celebration of the mass. In England, it is almost invariably placed on the

Piscina, Warmington.

south side of the choir, at a convenient height.

PISÉ, a kind of work used instead of brick, &c., for the walls of cottages. It consists of loam or earth hard rammed into framing, which, when dry, forms a wall.

PÍSEK (Boh. *Piscek*, sand), a small town of Bohemia, on the right bank of the Wottawa, an affluent of the Moldau, stands on a sandy plain (from which circumstance it probably received its name) 55 miles south-south-west of Prague. The town is old, and contains the remains of a royal castle. Among other institutions are a school of arts and a high school. The manufactures are woollen and cotton fabrics, iron wire, and musical instruments. Pop. 8178.

PISHAMIN. See DATE PLUM.

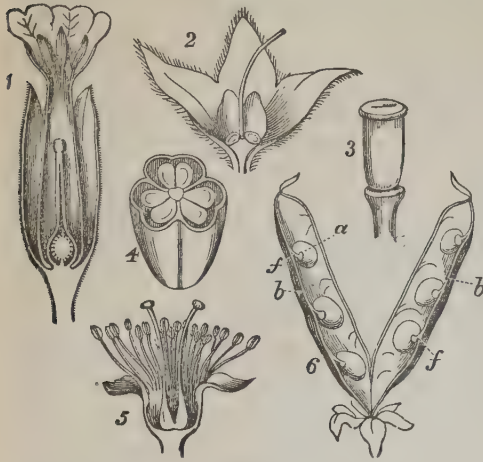

PÍ SOLITE (Gr. pea-stone), a concretionary limestone, differing from oolite in the particles being as large as pease.

PISTA'CIA, a genus of trees of the natural order *Anacardiaceae*, having dioecious flowers without petals, and a dry drupe with a bony stone.—The **PISTACIA** or **PISTACHIO TREE** (*P. vera*) is a small tree of about 20 feet high, a native of Persia and Syria, but now cultivated in all parts of the south of Europe and North of Africa, and in many places naturalised. It has pinnate leaves, with about two pair of ovate leaflets, and an odd one; flowers in racemes; fruit ovate, and about the size of an olive. The stone or nut splits into two valves when ripe; the kernel, which is of a bright green colour, is very oleaginous, of a delicate flavour, and in its properties very much resembles the sweet almond. In the south of Europe and in the East, *Pistachio nuts* are much esteemed; but as they very readily become rancid, they are little exported to other countries. They are sometimes called *Green Almonds*. Oil is expressed from them for culinary and other uses. In cultivation, one male tree is allowed to

five or six fertile ones. The tree produces flowers and even fruit readily enough in the south of England, but the summers are not warm enough to ripen the fruit, and the tree is apt to be destroyed by a severe frost.—The **MASTIC TREE**, or **LENTISK** (*P. lentiscus*), yields the gum-resin called *Mastic* (q. v.). It is a native of the countries around the Mediterranean.—The **TURPENTINE TREE** (*P. terebinthus*) yields the Turpentine (q. v.) known in commerce as *Cyprus Turpentine*, *Chian Turpentine*, or *Scio Turpentine*, which is of a consistency somewhat like that of honey, a greenish-yellow colour, an agreeable odour, and a mild taste, and in its properties resembles the turpentine of the *Coniferae*, but is free from acidity. It is obtained by making incisions in the trees, and placing stones for the turpentine to flow upon, from which it is scraped in the morning, before it is liquefied again by the heat of the sun. The tree is about 30 or 35 feet in height; and has pinnate leaves, of about three pair of leaflets and an odd one; the flowers in compound racemes, the fruit nearly globular. The kernel of the fruit is oleaginous and pleasant.—The **BATOUN TREE** (*P. Atlantica*), a round-headed tree of about 40 feet in height, a native of the north of Africa, produces a fruit much used by the Arabs; and a gum-resin of pleasant aromatic smell and agreeable taste, which exudes from its stem and branches, is chewed to clean the teeth and impart a pleasant smell to the breath.—The fragrant oil of the kernels of *P. oleosa*, a native of Cochinchina, is used by the people of that country to impart a perfume to ointments.

PISTIL, in Botany, the female organ of fructification in phanerogamous plants; that part of the Flower (q. v.) which, after flowering is over, is developed into the fruit. There is sometimes one pistil in a flower, sometimes more; in some flowers, which have numerous pistils, they form a number of whorls, one within another, sometimes on an elevated receptacle or elongated axis, or more rarely, they are spirally arranged. In every case, the centre of the flower is occupied by the pistil or pistils, if present. See FLOWER. A pistil is either formed of a single Carpel (q. v.), as is the case when there are numerous pistils, or of several carpels combined; and the number of carpels of which the pistil is formed is often indicated by the number of the cells of the germen, or by its lobes or angles. The pistil usually consists of a Germen (q. v.) or ovary, in which the Ovules (q. v.) are contained, and which is surmounted by a *stigma*, either immediately or through the intervention of a *style*; but in *Gymnogens* (q. v.), there is neither germen, style, nor stigma, the female organs of fructification being mere naked ovules. The germen is always the lowest part of the pistil. The stigma exhibits an endless variety of forms, and is adapted to the reception and retention of the pollen grains requisite for fecundation, partly by the roughness of its surface—which is of a somewhat lax cellular tissue, covered with projecting cells, often in the form of minute warts, and often elongated into hairs—and partly by the secretion of a viscous fluid. The stigma when not *sessile*—or seated immediately on the germen—is supported by the style, which rises from the germen, and on the top of which the stigma is generally placed. The style is sometimes very long and slender, sometimes very short; the germen sometimes passes imperceptibly into the style, and sometimes the style rises from it abruptly; and similar differences appear in the relations of the style and stigma; the stigma, however, may be regarded as always an expansion of the top of the style, although it is sometimes, but rarely, situated on one or both sides of the style, beneath its summit. In like

manner, by peculiar modifications taking place in the growth of the germen, the style sometimes seems to arise from beneath its apex, or even from

Pistils :

1, Section of flower of a species of Primrose, shewing the pistil laid open; numerous ovules attached to a free central placenta. 2, Section of flower of Comfrey, with corolla removed, shewing two of the four ovaries, and the style. 3, Pistil of the Barberry, consisting of several carpels combined; the style very short and thick, the stigma shield-like. 4, Section of the ovary of a Lily. 5, Section of flower of Cherry, shewing pistil of two separate carpels, only one of which comes to perfection in fruit. 6, Pistil of Pea, opened; a, ovule; b, placenta; f, umbilical cord.—From Balfour's *Class-book of Botany*.

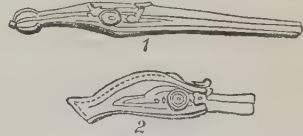

its base; but it always rises from what is, structurally considered, the real apex of the germen. When several carpels are united to form one germen, they are sometimes again separated in their styles, and more frequently in their stigmas, so that one germen bears several styles, or the style divides at some point above the germen, or one style is crowned by a number of stigmas. The style is usually cylindrical; and when this is not the case, it is often owing to the combination of several styles into one, although sometimes the style is flat and even petal-like. It is traversed throughout its whole length by a canal, which, however, is in general partly filled up by cells projecting from its sides, and often also by very slender tubes extending in the direction of its length; the function of the canal, to which in some way or other the enclosed slender tubes are subservient, being to bring about the connection between the pollen and the ovules for Fecundation (q. v.). The length of the style is adapted to the ready fecundation of the ovules, being such that the pollen may most easily reach the stigma; and in erect flowers, the styles are usually shorter than the stamens; in drooping flowers, they are longer than the stamens. After flowering is over, when fecundation has taken place, the *foramen* of the ovules closes, the germen enlarges and ripens into the fruit, whilst each ovule is developed into a seed. The style and stigma meanwhile either fall off, or remain and dry up, or they increase in size, and are changed into various kinds of appendages of the fruit, as feathery awns, beaks, &c.

PISTILLIDIUM, in Botany, a term which, along with *Antheridium* (q. v.), must be regarded as provisional, and as expressive of an opinion, probable, but not yet ascertained to be true. The evidence in favour of it, however, seems continually to increase, and its great probability is more and

more generally acknowledged. The pistillidium is an organ of cryptogamous plants, supposed to perform functions in fructification analogous to those of the pistil in phanerogamous plants. It consists of a germen-like body—the *sporangium*, *theca*, or *spore-case*—hollow, and containing Spores (q. v.), by which the species is propagated. These spore-cases are very various in their forms and in the situations which they occupy in different orders and genera; being sometimes immersed in the substance of the plant, sometimes distinct from it, sometimes sessile, sometimes stalked, &c. See the articles on the different cryptogamous orders.

PISTOJA (anc. *Pistorium*), a manufacturing town of Italy, in the province of Florence, and 21 miles by railway north-west of the city of that name, stands on a gentle rising ground at the foot of the Apennines. It is well built; its streets are thoroughly Tuscan, and it is surrounded by lofty and well-preserved walls. The chief buildings are the cathedral, built at various times, and containing a number of good pictures; several old and interesting palaces, and a number of churches, some of which are of importance in the history of medieval architecture and sculpture. The principal manufactures are iron and steel wares, and paper. Pop. about 12,000.

PISTOL is the smallest description of fire-arm, and is intended to be used with one hand only. Pistols vary in size from the delicate saloon-pistol, often

Ancient Pistols :

1, Long Wheel-lock Pistol; 2, Pocket 'Wheel-lock Dag'-temp. Elizabeth.—From Fairholt's *Costume in England*.

not six inches long, to the horse-pistol, which may measure 18 inches, and sometimes even two feet. They are carried in holsters at the saddle-bow, in the belt, or in the pocket. Every cavalry soldier

Modern Pistol.

should have pistols, for a fire-arm is often of great service for personal defence, and almost indispensable in giving an alarm or signal. Sailors, when boarding an enemy's ship, carry each two in their waistbelts.

As early as the reign of Henry VIII., the English cavalry carried clumsy pistols called 'dags.' The latest improvement on the pistol is the Revolver (q. v.).

PISTOLE, the name given to certain gold coins current in Spain, Italy, and several parts of Germany. The pistole was first used in Spain, and was originally equivalent to about 11 old French livres, but till 1728 it was merely an irregular piece of gold. From this time till 1772, its value was 17s. 1d. sterling; but it was after this date decreased till it reached its present value of 80 reals, or 16s. 2d. sterling. Gold coins of 4, 2, 1, and ½ pistoles are at the present day current in Spain. The Italian pistoles are also gold coins, and vary considerably in value: that of Rome =

13s. 9d.; of Venice = 16s. 2½d.; of Florence and Parma = 16s. 10½d.; and the old coin of Piedmont = £1, 2s. 7½d., or 24 old liras. These will, however, in all probability, be soon superseded by the new pistole of 20 liras, or francs, which is equivalent to 16s. sterling. Gold coins of this name are current in Hesse-Cassel, Switzerland, Brunswick, and Hamburg, but are in most cases merely convenient multiples of the ordinary thaler and gulden.

PISUM. See **PEA**.

PIT, in Gardening, is an excavation in the ground, intended to be covered by a Frame (q. v.), and to afford protection to tender plants in winter, or for the forcing of vegetables, fruits, &c. Pits are often walled on all sides, although, in many cottage gardens, excellent use is made of pits which are mere excavations. The walls are often raised above the ground, particularly the back wall, the more readily to give slope to the glazed frame. A pit in which no artificial heat is supplied, is called a *cold pit*; but when forcing is intended, flued pits are often used. Artificial heat is sometimes also given by means of fermenting matter. The ventilation of pits, as much as the weather will permit, is of the greatest importance.

PIT'A-HEMP, one of the names of the Agave or Aloe fibre. See **AGAVE**.

PIT'AKA (literally, 'basket') is, with the Buddhists, a term denoting a division of their sacred literature, and occurs especially in combination with *tri*, 'three'; *tripit'aka* meaning the three great divisions of their canonical works, the *Vinaya* (discipline), *Abhidharma* (metaphysics), and *Sutra* (aphorisms in prose), and collectively, therefore, the whole Buddhistic code. The term 'basket' was applied to these divisions, because the palm-leaves on which these works were written were kept in baskets, which thus became a part of the professional utensils of a Bhikshu, or religious mendicant.

PITCAIRN ISLAND, a solitary island in the Pacific Ocean, lying at the south-eastern corner of the great Polynesian Archipelago, in lat. 25° 3' 6" S., and long. 130° 6' W. Its length (2½ miles) is about twice its breadth, and the total content is approximately 1½ square miles; so that, except from its being the only station (with the exception of the Gambier Islands) between the South American coast and Otaheite at which fresh water can be procured, it would be too insignificant to deserve notice, were it not for the manner in which it was colonised. The island is wholly surrounded by rocks; it has no harbour, and its soil is not very fertile. It was occupied in 1790 by the mutineers of the *Bounty* (see **BLIGH, WILLIAM**), who, after touching at Toobonai, sailed for Tahiti, where they remained for some time. Christian, the leader of the mutineers, however, fearing pursuit, hastened their departure; and after leaving a number of their comrades who preferred to stay on the island, they brought off with them 18 natives, and sailed eastward, reaching P. I., where they took up their residence, and burned the *Bounty*. They numbered then 9 British sailors—for 16 of the sailors had preferred to remain at Tahiti, and of these, 14 were subsequently captured, and (September 1792) three of them executed—and 6 Tahitian men, with 12 women. It was impossible for concord to subsist in a band of such desperate character; and, in the course of the next ten years, all the Tahitian men, all the sailors, with the exception of Alexander Smith (who subsequently changed his name to John Adams), and several of the women, had died by violence or disease. From the time of their leaving Tahiti, nothing had been heard of them, and their fate was only known when an American, Captain

Folger, touched at P. I. in 1808, and on his return, reported his discovery to the British government; but no steps appear to have been taken by the latter. On September 17, 1814, a British vessel, the *Britain*, called at the island, and found old Adams still alive, commanding the respect and admiration of the whole little colony, by his exemplary conduct and fatherly care of them. Solitude had wrought a powerful change in Adams; and his endeavours to instil into the young minds of his old companions' descendants a correct sense of religion, had been crowned with complete success, for a more virtuous, amiable, and religious community than these islanders, had never been seen. They were visited by British vessels in 1825 and 1830, and the reports transmitted concerning them were fully corroborative of the previous accounts; but, in 1831, their numbers (87) had become too great for the island, and at their own request, they were transported to Tahiti, in the *Lucy Ann*, by the British government. But, disgusted at the immorality of their Tahitian friends and relatives, they chartered a vessel, defraying the cost of it in great part with the copper bolts of the *Bounty*, and most of them returned to P. I. at the end of nine months. In 1839, being visited by Captain Elliot of H.M.S. *Fly*, they besought to be taken under the protection of Britain, on account of the annoyances to which they had been subjected by the lawless crews of some whale-ships which had called at the island; and, accordingly, Captain Elliot took possession of it in the name of Her Majesty, gave them a Union Jack, and recognised their self-elected magistrate as the responsible governor. He also drew up for them a code of laws, some of which are amusing from the subjects of which they treat, but the code was of great use to the simple islanders. From this time, they were frequently visited by European ships; and, in 1855, finding their numbers again too great for the island, they petitioned government to grant them the much more productive Norfolk Island, to which they were accordingly removed in 1856. In 1859, however, two families, numbering in all 17, returned to P. I., reducing the number of those left on Norfolk Island to 202. From their frequent intercourse with Europeans, the Pitcairn Islanders have, while still retaining their virtuous simplicity of character and cheerful hospitable disposition, acquired the manners and polish of civilised life, with its education and taste. They are passionately fond of music and dancing, the latter evidently a legacy from their maternal ancestry. The men are engaged in whaling and herding cattle, or in cultivating their gardens and plantations; while the women (who seem to be the more industrious class) attend to their families, manage the dairies, and take an occasional part in field-labour.

P. I. was first discovered by Carteret in 1767, and was named by him after one of his officers; but it was never visited by Europeans till taken possession of by the mutineers, though the latter found satisfactory indications of its having previously been occupied for a considerable period by savages, probably from the neighbouring islands.

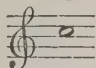

PITCH. The common kind of pitch is the black residue which remains after distilling wood-tar. See **TAR**. It is made extensively in Russia, Norway, and North America. It is a most useful material for protecting wood from the action of water, hence it is used for calking the seams, and coating the outsides of ships, and boats; it is also applied to the inside of water-casks, and many similar uses. A variety of pitch is now obtained from the distillation of coal-tar, and another from bone-tar: the latter is said to be nearly equal in

value to that from wood, but coal-pitch wants the toughness which is one of the more valuable qualities of wood-pitch. It is, however, much used in making artificial asphalt for building and paving purposes; and for the black varnish used for coating iron-work to keep it from rusting. Pitch is solid at the ordinary temperature of our climate, but softens and melts with a small accession of heat.

PITCH, BURGUNDY. See **BURGUNDY PITCH.**

PITCH, the degree of acuteness of musical sounds. A musical sound is produced by a series of vibrations recurring on the ear at precisely equal intervals; the greater the number of vibrations in a given time, the more acute or higher is the pitch. In stringed instruments, the pitch is dependent on the length, the thickness, and the degree of tension of the strings; the shorter and thinner a string is, and the greater its tension, the higher is the pitch of the note. In wind instruments, where the notes are produced by the vibration of a column of air, as in the mouth-pipes of an organ, the pitch is dependent on the length of the column set in motion; the shorter the column of air, the higher the pitch becomes.

The pitch of musical instruments is adjusted by means of a tuning-fork, consisting of two prongs springing out of a handle, so adjusted as to length that, when struck, a particular note is produced, that

note being C  in Britain, and A 

In Germany. It is obviously important to have a recognised standard of pitch, by which instruments and voices are to be regulated; but there is, unfortunately, not the uniformity that might be desired in the pitch in actual use. For a long time prior to 1859, concert-pitch had been gradually rising, to the detriment of the voices of public singers. The C tuning-fork, in use in 1699, made 489 vibrations per second, while in 1859, the number of vibrations had increased to 538. Mr Hullah, in 1842, in the numerous classes instituted by him under the sanction of the Committee of Council on Education, found it necessary to secure a uniform standard of pitch, and adopted 512, which has an especial convenience as being a power of 2. The French Imperial government, in 1858, fixed on 522. In 1859, a Committee of the Society of Arts was appointed to consider the subject of a uniform musical pitch. Their deliberations lasted 12 months. Sir John Herschel, in a letter to the Committee, strongly recommended the number 512. It was agreed on all hands that the then existing opera-pitch of 546 was too high and painful to the singers of soprano music. The instrumental performers stated that they could lower the pitch to 528, but if they had to lower it to 512, some of them would have to purchase new instruments; and, in consequence apparently of their representation, the Committee reported in favour of 528.

PITCHBLLENDE, a mineral which is essentially Oxide of Uranium (q. v.), with slight mixtures of other substances. Its colour is grayish-black or brownish-black. It is infusible before the blowpipe, without the addition of borax, with which it fuses into a dull yellow glass.

PITCHER PLANT. See **NEPENTHES.**

PITCHSTONE, a name sometimes given to a variety of common Opal (q. v.), brown, black, gray, red, or of mixed colours; the lustre more resinous than in opal, and the fracture less perfectly conchoidal. It occurs in several localities in the British Islands, in Saxony, &c.—The same name is given to another mineral (Ger. *Pechstein*), a variety

of Felspar (q. v.), occurring as a rock in dikes which traverse strata or in overlying masses; compact, slaty, or in concentric slaty concretions. It exhibits great variety of colour, and has a somewhat resinous appearance. It often contains numerous imbedded crystals of felspar, and is then called *P. porphyry*.

PITCHURIM BEANS, or SASSAFRAS NUTS, an occasional article of importation from South America, are the seed-lobes of *Nectandra Puchury*, a tree of the same genus with the Greenheart (q. v.), growing on the banks of the Rio Negro and elsewhere in the rich alluvial parts of the basin of the Amazon. They are about an inch and a half long, and half an inch broad. They are much in request among chocolate manufacturers for flavouring chocolate, as a substitute for vanilla. They are sometimes called Wild Nutmegs, because of a resemblance to nutmeg in flavour. The name Sassafras Nuts is also due to the flavour, which approaches that of Sassafras bark; and the tree belongs to the same natural order with the Sassafras tree.

PITH (*Medulla*), the light cellular substance which occupies the centre of the stem and branches in Exogenous Plants (q. v.). In the earliest stage of a young stem or branch, it is entirely composed of pith and bark, by which alone, therefore, young buds are nourished; the vascular bundles or woody fibre appearing afterwards, and in trees and shrubs, generally increasing, so as to constitute the greater part of the substance of the stem and branches, whilst the pith is ultimately reduced to a very small column in the centre. The pith, however, exists even in the most mature woody stem, and maintains its connection with the bark by means of *Medullary Rays*, analogous in their character to the pith itself, and which exist even in the most compact wood, although much compressed by the woody layers, and in a transverse section appearing as mere lines. The medullary rays convey to the central parts of the stem the secretions of the bark necessary for their nourishment. P. is in general entirely composed of cellular tissue; vessels occurring in it only in a few plants. Its cells diminish in size from the centre towards the circumference. In a few plants, it exhibits cavities which have a regular arrangement; in many herbaceous plants of rank growth, large irregular cavities occur in it. The pith is immediately surrounded by a thin vascular layer called the *Medullary Sheath*, consisting chiefly of spiral vessels, which continue to exercise their functions during the life of the plant.

PITHECIA. See **SAKI.**

PITHECUS. See **ORANG.**

PITON BARK. See **CARIBBEE BARK.**

PITRI (a Sanscrit word literally meaning father = Latin *pater*, in the plural *Pitaras*, but in English translations from the Sanscrit usually Anglicised to *Pitris*), a name which, in a general sense, means the deceased ancestors of a man, but in the special sense in which it occurs in Hindu mythology denotes an order of divine beings inhabiting celestial regions of their own, and receiving into their society the spirits of those mortals for whom the funeral rites (see *S'RADDHA*) have been duly performed. They include, therefore, collectively the manes of the deceased ancestors; but the principal members of this order are beings of a different nature and origin. According to Manu, they were the sons of Marichi, Atri, Angiras, and the other Rishis or saints produced by Manu, the son of Brahmā; and from them issued the gods, demons, and men. According to several Purānas (q. v.), however, the first Pitris were the sons of the gods; and to reconcile this discrepancy, a legend relates

that the gods having offended Brahmā by neglecting to worship him, were cursed by him to become fools; but upon their repentance, he directed them to apply to their sons for instruction. Being taught accordingly the rites of expiation and penance by their sons, they addressed the latter as fathers, whence the sons of the gods were the first Pitṛis (fathers). See Wilson's *Vishn'u-Purāṇ'a*. Manu enumerates various classes of Pitṛis in defining those who were the ancestors of the gods, those who were the ancestors of the demons, and those from whom proceeded the four castes severally; but he adds, at the same time, that these are merely the principal classes, as their sons and grandsons indefinitely must likewise be considered as Pitṛis. The Purāṇas divide them generally into seven classes, three of which are without form, or composed of intellectual, not elementary substance, and assuming what forms they please, while the four other classes are corporeal. In the enumeration, however, of these classes the Purāṇas differ. The Pitṛis reside in a world of their own, called Pitṛi-loka, which is sometimes supposed to be the moon; according to the Purāṇas, it is below the paradise of Indra, and is also the abode of the souls of devout Brahmans. The time at which the Pitṛis are to be worshipped, the libations which they are to receive, the benefit which they derive from them, and the boons which they confer on the worshipper, are all minutely described in the Purāṇas. See S'RĀDDHA. A song of the Pitṛis, as given by the *Vishn'u-Purāṇ'a*, may convey an idea of the importance attributed to this worship, and of the manner in which the Brahmans turned it to their profit. It runs as follows: 'That enlightened individual who begrudges not his wealth, but presents us with cakes, shall be born in a distinguished family. Prosperous and affluent shall that man ever be who, in honour of us, gives to the Brahmans, if he is wealthy, jewels, clothes, lands, conveyances, wealth, or any valuable presents; or who, with faith and humility, entertains them with food, according to his means, at proper seasons. If he cannot afford to give them dressed food, he must, in proportion to his ability, present them with unboiled grain, or such gifts, however trifling, as he can bestow. Should he be utterly unable even to do this, he must give to some eminent Brahman, bowing at the same time before him, sesamum seeds, adhering to the tips of his fingers, and sprinkle water to us, from the palms of his hands, upon the ground; or he must gather, as he may, fodder for a day, and give it to a cow; by which he will, if firm in faith, yield us satisfaction. If nothing of this kind is practicable, he must go to a forest, and lift up his arms to the sun and other regents of the spheres, and say aloud: "I have no money, nor property, nor grain, nor any thing whatever fit for an ancestral offering; bowing therefore to my ancestors, I hope the progenitors will be satisfied with these arms tossed up in the air in devotion." See Wilson's *Vishn'u-Purāṇ'a*.

PITT, WILLIAM, the second son of the Earl of Chatham and of Lady Hester Grenville, daughter of the Countess Temple, was born on the 28th May 1759. His genius and ambition displayed themselves with an almost unexampled precocity. 'The fineness of William's mind,' his mother writes of him, when he was but twelve years old, 'makes him enjoy with the greatest pleasure what would be above the reach of any other creature of his small age.' Owing to the excessive delicacy of his constitution, it was found impossible to educate him at a public school. His studies were, however, prosecuted at home with vigour and success. In 1773, he was sent to the university of Cambridge, where his knowledge of the classics seems to have

astonished veteran critics. To modern literature, he appears to have been utterly indifferent—he knew no continental language except French, and that very imperfectly. Among English poets, he liked Milton best; the debate in Pandemonium being his favourite passage. In 1780, P. was called to the bar. He took chambers in Lincoln's Inn, and joined the western circuit. A general election having taken place in the autumn of the same year, he stood for the university of Cambridge; but he was at the bottom of the poll. Through the influence, however, of the Duke of Rutland, he obtained a seat in parliament as member for Appleby. Lord North was now prime-minister. The Opposition consisted of two parties; one being led by Rockingham and Fox, the other by Lord Shelburne. The latter consisted chiefly of the old followers of Chatham; and to this party Pitt naturally became attached. On 26th February 1781, he made his first speech in parliament. It was in favour of Burke's plan of economical reform, and was a splendid success. 'It is not a chip of the old block,' said Burke; 'it is the old block himself.' Shortly before the meeting of parliament, in the autumn of 1781, the news arrived of the surrender of Cornwallis and his army. In the debate on the address, P. spoke with even more energy and brilliancy than on any former occasion. No one was so loud in eulogy as Henry Dundas, Lord Advocate for Scotland; and from this night dates a connection between him and P., which was only broken by death. After several defeats, the ministry resigned, and Rockingham was called on to construct a cabinet. P. was offered the vice-treasurership of Ireland; but he declined to accept a position which did not confer a seat in the cabinet. On 7th May 1782, he made his first motion for a reform in the representation of the people; which motion was lost by only 20 votes in a house of more than 300 members. The reformers never again had so good a division till 1831. At the end of three months after his accession to office, Rockingham died; Lord Shelburne succeeded to the head of the treasury; and P., at the age of 23, became Chancellor of the Exchequer. In opposition to the government, there was then formed a coalition emphatically known as 'The Coalition.' On Lord Shelburne's resignation in 1783, the king himself, who hated the Coalition, tried to persuade P. to take the helm of affairs; but he resolutely declined. The Duke of Portland succeeded, with Fox and North as Secretaries of State. P., from the Opposition benches, brought for a second time the question of parliamentary reform before the House. His motion was lost by 293 votes to 149. On the prorogation, he visited the continent for the first and last time. In 1783, the ministry having been defeated on a motion for transferring the government of India to parliament, P. became First Lord of the Treasury and Chancellor of the Exchequer. But parliament was dead against him: between 17th December 1783 and 8th March 1784, he was beaten in sixteen divisions. The nation, however, was in his favour; both on account of his policy, and from admiration of his private character. Pecuniary disinterestedness is what all can comprehend; and even when known to be overwhelmed with debt, when millions were passing through his hands, when the greatest men in the land were soliciting him for honours, no one ever dared to accuse him of touching unlawful gain. At the general election in 1784, 160 supporters of the Coalition lost their seats, P. himself heading the poll for the university of Cambridge. He was now, at 25 years old, the most powerful subject that England had seen for many generations. He ruled absolutely over the cabinet, and was at once the

favourite of the sovereign, of the parliament, and of the nation; and from this date, the life of P. becomes the history of England and of the world. For seventeen eventful years, he held his great position without a break. In 1784, he established a new constitution for the East India Company. In 1786, he carried through a commercial treaty with France on liberal principles. In the same year, he established a new sinking fund; a scheme which experience has shewn to be wrong in principle, though it was long viewed with favour by the nation. To exertions which were now begun for the abolition of the slave-trade, he gave the help of his eloquence and power. In 1788—1789, he maintained against Fox the right of parliament to supply the temporary defect of royal authority occasioned by the incapacity of the king. The year 1793 saw the beginning of the great war with France. Authorities differ as to the cause. It is, however, certain that P.'s military administration was eminently unsuccessful. But no disaster could daunt his spirit. When a new French victory, a rebellion in Ireland, a mutiny in the fleet, and a panic in the city had spread dismay through the nation, P. from his place in parliament poured forth the language of inextinguishable hope and inflexible resolution. Disaster abroad was regularly followed by triumph at home, until at last he had no longer an opposition to encounter. In 1799, he effected the union with Ireland. It was part of his scheme to relieve the Roman Catholic laity from civil disabilities, and to grant a public maintenance to their clergy; but the obstinacy of the king frustrated this design. Chagrined by this failure, P. resigned office in 1801. He was succeeded by Mr Addington, to whom for a while he gave his support. In 1804, he returned again to the head of the treasury, which position he continued to hold till his death on 23d January 1806. This event was doubtless hastened by the stupendous success of Napoleon. The peculiar look which he wore during the last days of his life was pathetically termed by Wilberforce 'the Austerlitz look.' The impeachment also of his friend, Lord Melville, is supposed greatly to have hastened his end. It gave him, he said in parliament, a deep pang. His voice quivered as he uttered the word; and it seemed as if the man of iron were about to shed tears. 'He was,' says Macaulay, 'a minister of great talents, honest intentions, and liberal opinions, . . . but unequal to surprising and terrible emergencies, and liable in such emergencies to err grievously, both on the side of weakness and on the side of violence.' But what man ever lived, we may ask, who, placed in such circumstances as P., would not often have greatly erred? His policy was liberal beyond his age, at least he wished it to be so, although he was often obliged to yield to the prejudices of his sovereign. He resigned office because he could not carry Catholic emancipation. He laid before the king unanswerable reasons for abolishing the Test Act. He was more deeply imbued with the doctrines of free-trade than either Fox or Grey. It cannot indeed be denied that he was addicted to port-wine, and that he died overwhelmed with debts; parliament voting £40,000 to his creditors. High as his character stands, it would have stood even higher had he united the virtue of frugality to that of disinterestedness. See *Life of Pitt* by Lord Stanhope (Lond. 1861); also Lord Macaulay's *Biographies* (Edin. 1860). In the former work, vol. ii., p. 185, will be found a valuable criticism on Macaulay's memoir.

PITTACUS, one of the 'Seven Wise Men' of ancient Greece, was born at Mitylene, in the island of Lesbos, about the middle of the 7th c. B.C. The

incidents of his life do not perhaps rest on a very secure historical basis, but he is by no means to be regarded as a merely traditional personage. We may feel quite certain that his career and character were substantially what later history represents them. About 612 B.C., in conjunction with the brothers of Alcæus the poet, he overthrew the 'tyrant' Melanchrus, and put him to death. He next figures in the contest between the Lesbians and the Athenians for the possession of Sigeum in the Troad, and displayed as much valour on the battle-field as Alcæus did cowardice. His townsmen, the Mityleneans, were so pleased with his deeds of prowess, that they gave him a portion of the city-territory, which he dedicated to sacred uses, and which was known long after as the 'Pittaceian land.' Meanwhile, the civic struggles did not cease; the democratic party, however, roughly represented by a series of popular 'tyrants,' were in the ascendant, and the oligarchic aristocrats, at the head of whom was Alcæus, were finally banished. P. was subsequently chosen dictator, 589 B.C., to prevent the turbulent exiles from returning to Mitylene, and ruled absolutely with great success for ten years, after which he voluntarily resigned his power, and withdrew into honoured retirement. He died in 569 B.C. Many of the anecdotes preserved by tradition concerning P. are probably apocryphal; but they all attribute to him the same characteristics—great moral sagacity, a contempt of outward pomp, and a plain practical understanding. His favourite maxim, *Gnôthi Kaîrôn* ('Know the fitting moment'), may be recommended to all statesmen and politicians. To P. is also ascribed the saying which has so often been verified in actual history, *Chalepôn esthlon emmenai* ('It is a misfortune to be eminent'). Of his 600 didactic verses, only four are extant, and these prove that he was strongly impressed with the falsehood and insincerity of men. See Schneidewin's *Delectus Poesis Græcorum Elegiacæ*, &c. (Gott. 1839.)

PITTSBURG, including several boroughs adjoining, is the second city of Pennsylvania, situated at the confluence of the Alleghany and Monongahela rivers, and the head of the Ohio, lat. 40° 26' 34" N., long. 80° 2' 38" W. It is 750 feet above the sea, and in the midst of some of the richest deposits of coal and iron in America, which have given direction to its industries. From the mines upwards of 140,000,000 bushels of coal were raised in 1870, some of which was exported, while an immense amount was used in her 60 iron foundries, which consumed 400,000 tons of iron, 60,000 tons of which were made in the furnaces of Pittsburgh. The city has 42 iron and steel mills, 582 puddling furnaces, 7 large steel works, 60 glass factories, employing 5000 hands, 20 brass foundries, 3 copper smelting and rolling mills, 58 petroleum refineries, 8 white lead factories, 6 cotton mills, 6 flour mills, with a total of 1500 manufacturing establishments of all kinds, and a manufacturing and commercial business estimated, in 1870, at \$170,000,000. The manufacturing industries of P. are on a vast scale; 475 of her factories in daily operation would extend 35 miles in a direct line. At one of the establishments for the manufacture of axes, saws, &c. (that of Lippincott and Bakewell), 250 men are employed, and axes produced at the rate of 1000 daily throughout the year. The city contains 165 churches, 191 public school-houses, with 7129 children in attendance; 1 university, 3 theological seminaries, a penitentiary, and house of refuge; 54 banks, and 2500 commission houses which are not manufactories. P. is very healthy, but the imperfect combustion of her bituminous coal filling the air with smoke, &c., renders it disagreeable, and entitled to the *sobriquet* of the 'Smoky City.' It is also frequently termed the 'Iron City' and the 'Birmingham of America.'

The several sections of this busy hive are connected by bridges and continuous lines of street railroads, thus practically rendering the suburbs—Alleghany City, Birmingham, Monongahelaboro, South Pittsburgh, West Pittsburg, Mount Washington, &c.—almost one compact city of nearly 250,000 people.

Nine railroads centre at P., while a vast navigation is conducted upon 30 rivers, embracing an extent of 12,000 miles, and into 15 states. There is a United States arsenal at Alleghany City.

The first settlement of P. was in the stockade erected in 1754, which fell into the hands of the French, who gave it the name of Fort Duquesne. To capture this fort the expedition of Braddock was undertaken, which was defeated by the French and Indians in 1755. In 1758 it was abandoned by the French and occupied by the English, who, in 1759, erected the first Fort Pitt, whence the city took its name. P. was chartered in 1816. Pop. in 1840, 21,115; in 1860, 49,220; in 1870, 86,076; in 1880, 156,389.

PITTSFIELD, a flourishing city in Berkshire co., Mass., on the Western Railway, 53 miles W. N. W. of Springfield and 49 miles E. S. E. of Albany. The Housatonic Railway connects it with Bridgeport, Conn. It has cotton and woollen manufactories, 11 churches, 2 national banks, a young ladies' institute, a court-house, &c. Pop. (1880) 13,364.

PITYRIASIS (from the Greek word *pituros*, bran) is the term given to one of the squamous or scaly diseases of the skin, in which there is a continual throwing off of bran-like scales of epidermis, which are renewed as fast as they are lost. It may occur upon any part of the body, giving rise to brown patches, in which there are sensations of itching, tingling, or pricking. It is more easily cured than the other scaly diseases, and its removal can generally be effected by the frequent use of the warm bath; or, if it fails, recourse may be had to alkaline or sulphur baths; due attention being at the same time paid to the general health. It sometimes occurs on the scalp, when it is known as *dandruff*, and must be treated with weak alkaline lotions, or, if these fail, with tar ointment, provided there is no inflammation. There is a variety known as *Pityriasis versicolor*, which is probably due to the presence of a parasitic fungus, the *Microsporon furfurans*; but whether the fungus is the positive cause of the disease, or only an attendant on it, finding a suitable nidus in the diseased epidermis, is not certain. This variety may be detected by a microscopic examination of the exfoliated scales, when the spores and filaments of the fungus will be detected. The treatment of this affection must be solely local. Dr Watson mentions a case which yielded at once to a couple of sulphur baths. Probably the best remedy is the application of a saturated watery solution of sulphurous acid gas, or of one of the sulphites dissolved in diluted vinegar.

PIÙ (in Ital. more), as a musical term, when prefixed to another word, intensifies its meaning—e. g., *più mosso*, with more movement.

PIUS, the name of nine among the Roman pontiffs, of whom the following only appear to call for particular notice.—PIUS II., originally known as Æneas Sylvius, was a member of the noble family of Piccolomini, and was born (1405) at Corsignano, in the duchy of Siena. His early life was not free from serious irregularities, but he made amends by his subsequent decorous conduct; and his eminent abilities as a canonist led to his being employed, when but 26 years of age, as secretary of the Cardinal of Fermo, in a post of the highest confidence at the council of Basel (q. v.). He was intrusted by that council—the views of which, in its conflict with the pope, he fully shared—

in several commissions of great importance; and on the election of the antipope, Felix V., Æneas Sylvius was chosen as his secretary. But having been sent by him as ambassador to the Emperor Frederick III., he was induced to accept office in the imperial court, and served on several embassies and other missions of importance on behalf of the emperor. In the difficulties between Frederick and the Pope Eugenius IV., which arose after the council of Florence, Æneas conducted so skillfully a negotiation with which he was intrusted, that the pope was induced to retain him in his own court, in the capacity of secretary. His views of church matters having undergone a considerable change, he continued in equal favour under the successor of Eugenius, Nicholas V., 1447; and under Callistus III., he was elevated to the cardinalate. On the death of Callistus in 1458, he was elected pope, and took the name of Pius II. His pontificate was embarrassed by some contests on German affairs, but it is chiefly rendered memorable by the sustained efforts which P.—the first in this policy of a long line of pontiffs, to whom the public security of Europe owes a deep obligation—made to organise an armed confederation of Christian princes to resist the progress of the Turkish arms. This organisation, however, for a long time did not lead to any considerable results. P. died, August 14, 1464. The literary reputation of the scholar, Æneas Sylvius, has partially eclipsed the historical fame of the Pope Pius. He was one of the most eminent scholars of his age. His works were published at Basel (1 vol. fol., 1551), but many of his works are not included in that edition. They consist chiefly of histories, or historical dissertations and materials of history; but the most interesting portion of his collected works are his letters, which are very numerous, and full of details, characteristic as well of the writer as of the age. The same may be said of a biographical commentary, which is in truth an autobiography, being chiefly written from his own dictation, by his secretary, John Gbellinus, published at Frankfort in 1614. See Voight's *Life of Pius* (Berl. 1856).—PIUS IV., Giovanni Angelo Medici, uncle of Saint Carlo Borromeo, deserves to be noticed from his connection with the celebrated creed known under his name. He was elected in 1560; and his pontificate is chiefly memorable as that in which the protracted deliberations of the Council of Trent (q. v.) were brought to a close. P. had the duty, in December 1563, of issuing the bull confirmatory of its decrees. The well-known creed called the Creed of Pius IV., and sometimes the Tridentine Creed, was issued by P. IV. as an embodiment of all the doctrines defined in that council. P. died, December 8, 1565, in the arms of his nephew, Carlo Borromeo.—PIUS V., a saint of the Roman Catholic Church, originally named Michele Ghisleri, was born of poor parents, in the village of Bosco, near Alessandria, in 1504, and at the age of fourteen, entered the Dominican order. His eminent merits were recognised by Paul IV., who named him Bishop of Satra, in 1556, and cardinal in the following year. Of austere and mortified habits, he carried into his administration the same rigour which distinguished his personal conduct; and when appointed inquisitor-general for Lombardy, he employed the most rigorous measures in repressing the progress of the Reformation, which had begun to effect an entrance. He was afterwards translated to the see of Mondovì; and immediately after the death of Pius IV., he was chosen unanimously as his successor, January 8, 1566. P. carried into his pontifical life the same personal austerity and administrative rigour which he had evinced as a bishop. Applying to others the same

rules which he enforced upon himself, he enacted a number of severe laws for the regulation of public morals, prohibiting bull-fights, suppressing prostitution, and proscribing a variety of popular but demoralising exhibitions. The Roman Inquisition, too, under his government, exercised a severity of which no other pontificate has shewn any example. He endeavoured to enforce everywhere the disciplinary decrees of the Council of Trent; and the whole spirit of his pontificate is most strikingly exhibited in the decree by which he ordered the yearly publication of the celebrated bull, *In Cena Domini* (q. v.). It was an application to the 16th c. of the principles and the legislation of the Hildebrandine epoch. But the most momentous event of the pontificate of P. was the expedition which he organised, with Spain and Venice, against the Turks, and which resulted in the great naval engagement of the Gulf of Lepanto, on 7th October 1571. P. died in the following May, 1572. He was canonised by Clement XI. in 1712.—PIUS VI., originally named Angelo Braschi, was born at Cesena, December 27, 1717. He was selected by Benedict XIV. as his secretary; and under Clement XIII., he was named to several important appointments, which led finally, under Clement XIV., to his elevation to the cardinalate. On the death of Clement XIV., Cardinal Braschi was chosen to succeed him, February 15, 1775. The conflict with the civil power in the various states of Europe, in which, from the days of Innocent XI., the Roman see had been almost unceasingly involved to a greater or less degree, assumed under P. what may be called its complete and scientific development. His relations to the Emperor Joseph of Austria and the Grand Duke Leopold of Tuscany, who persisted in the reformation of the religious orders, &c., were far from amicable. The internal administration of P., however, was enlightened and judicious. To him, Rome owes the drainage of the Pontine Marsh, the improvement of the port of Ancona, the completion of the church of St Peter's, the foundation of the new Museum of the Vatican, and the general improvement and embellishment of the city. These and other similar projects were interrupted by the outbreak of the French Revolution. In 1793, a popular tumult at Rome, which was caused by the imprudence of a French political agent named De Basseville, and which resulted in his death, gave the French Directory an opportunity of hostile demonstrations against the pope. In 1796, Bonaparte took possession of the Legations, and afterwards of the March of Ancona, and by a threatened advance upon Rome, extorted from P., in the Treaty of Tolentino, the surrender of these provinces to the Cisalpine Republic, together with a heavy war contribution. The year 1797 was marked by a continuance of the same vexatious measures; and at length the Directory ordered the invasion of Rome; Berthier entered the city, February 10, 1798, and took possession of the castle of St Angelo. P. was called on to renounce his temporal sovereignty, and on his refusal, was seized, February 20, and carried away to Siena, and afterwards to the celebrated Certosa, or Carthusian monastery, of Florence. On the threatened advance of the Austro-Russian army in the following year, he was transferred to Grenoble, and finally to Valence on the Rhone, where, worn out by age and by the rigour of confinement, he died in August 1799, in the 82d year of his age and the 24th of his pontificate.—PIUS VII., originally Gregory Barnabas Chiaramonte, was born at Cesena in 1742. He entered the Benedictine order at an early age, and was employed in teaching philosophy and theology at Parma, and afterwards at Rome. He was appointed Bishop of Tivoli; and afterwards, being

created cardinal, was translated to the see of Imola. After the death of Pius VI., Cardinal Chiaramonte was chosen his successor (March 14, 1800). Rome, which, up to this time, had been in the occupation of the French, was now restored to the papal authority, and in the July of that year, P. VII. entered into his capital; and in the following year, the French troops were definitively withdrawn from the papal territory, with the exception of the Legations. From this time forward, P., ably seconded by his secretary of state, Cardinal Consalvi, was destined to occupy a prominent place in the political as well as the ecclesiastical affairs of Europe. Bonaparte had resolved to restore religion in France on the ancient basis of connection with Rome. With this view, he entered into negotiations with P. VII. for the establishment of a concordat suited to the new order of things which had arisen. These negotiations were conducted at Paris, and were attended with many difficulties and delays, until at length Cardinal Consalvi repaired in person to the conference, and, by his energy and decision, disentangled the complicated embarrassments in which it was involved. It was agreed to at Paris, July 15, 1801; ratified in Rome, August 14; and published in Notre-Dame on Easter Sunday 1802. But simultaneously with the concordat, and as if forming part of the same arrangement, was published a code of what were called 'Organic Laws,' seriously affecting the discipline of the church on marriage, on the clergy, and on public worship, which had never been submitted to P., and to which he not only had not consented, but to which he found himself compelled to offer every opposition. For the first year which succeeded the publication of the concordat, no occasion of difficulty arose; but conflict of principles was in the end inevitable. In 1804, Bonaparte having resolved on assuming the imperial crown, invited P. to come to Paris for the purpose of crowning him, and the pope, although with much hesitation, consented. He took advantage of his visit to demand the recall or modification of the articles, but without success; and although, during his visit to Paris, he was treated with great distinction and reverence, his relations with Napoleon from that date began to assume a less friendly character. The French emperor now proceeded from one petty outrage to another, until finally, in February 1808, the French troops, under General Miollis, entered Rome, and took possession of the castle of St Angelo; and on the 2d of April, a decree was issued annexing the provinces of Ancona, Fermo, Urbino, and Macerata to the kingdom of Italy. P., besides protesting against the usurpation, declared himself a prisoner in the French hands, and confined himself to his palace. The papers of the cardinal secretary were violently seized, and the pope was compelled to appoint a pro-secretary; and finally (May 17, 1809), the usurpation was consummated by a decree annexing Rome and all the remaining papal territory to the French empire. This was the signal for the pope abandoning his lengthened policy of forbearance. On June 10, P. issued a bull of excommunication, directed (without naming Napoleon) against the perpetrators and abettors of the invasion of the rights and the territory of the holy see. Soon afterwards, the French general ordered the removal of the pope from Rome; and P., without offering any resistance beyond the declaration that he yielded to force, was removed, first to Florence, then to Grenoble, thence for a longer time to Savona, whence, in June 1812, he was finally transferred to Fontainebleau. During this prolonged captivity, P. firmly but quietly resisted every effort to compel or seduce him from his policy. At

fontainebleau, he was treated with much external respect; and on Napoleon's return from the Russian campaign, in December 1812, orders were given that the cardinals, with certain exceptions, should be admitted to the presence of the pope. Under much pressure, both from the emperor himself—who is alleged by some to have acted with great rudeness, and even with personal violence—and from the ecclesiastics to whom the emperor confided his plans, P. was induced to sign a new concordat, an important provision of which was the recognition of the annexation of the Roman states to the empire. Having obtained the concession, Napoleon at once permitted the absent cardinals to return, and of these many remonstrated so earnestly against the concordat, that, on March 24, P. wrote to revoke his consent. Napoleon took no notice of the revocation; nor was it till after the disasters of 1813 that he began to seek an accommodation. P. refused to treat until he should be restored to Rome; and on January 22, 1814, orders were sent for his immediate return to his capital. Unattended by his cardinals, he was escorted to Italy, and remained at Cesena until the fatal campaign of the spring of 1814 placed Paris in the hands of the allies, when P. re-entered Rome amidst the gratulations of the people on May 24, 1814—a day since that time held sacred in the Roman calendar. During the Hundred Days, he was again compelled to leave Rome; but after the campaign of Waterloo, he finally resumed possession, which was undisturbed for the rest of his life, and which extended to the whole of the ancient territory, including the Legations.

The last years of his pontificate were devoted to measures of internal administration; and under the enlightened government of Cardinal Consalvi, were marked by much wisdom and moderation. But the administration chiefly by ecclesiastics and the secrecy of law procedure were resumed. P. repressed, too, with great vigour the disorder and brigandage which the long wars had introduced, and a whole village of notorious and incorrigible criminality, that of Somma, was razed to the ground in 1819. He was equally vigorous in repressing secret societies, especially that of the Carbonari (q. v.). The ecclesiastical measures of his later period were also of much importance. In 1814, he formally restored the suppressed order of the Jesuits (q. v.). In 1817 and the following years, he concluded concordats with Naples, with Prussia, Würtemberg, and other courts of Germany. In this and every other period of his life, P. was a model of gentleness, simplicity, benevolence, and Christian charity. In July 1823, having reached the patriarchal age of 81, he fell accidentally in his own apartments, and broke his thigh. Under the inflammation which ensued, he sunk gradually, and died August 20, 1823.

PIUS IX., GIOVANNI MARIA MASTAI FERRETTI, the 257th Roman pontiff, was born at Sinigaglia, May 13, 1792. He was originally destined for a military career, and was sent to Rome to enter the Noble Guard; but symptoms of an epileptic tendency led to his abandoning his intended profession, and entering an ecclesiastical seminary. He received holy orders, and for a time exercised his ministry in connection with several works of charity and benevolence in Rome; but was sent to South America as 'auditor' of Monsignor Mugé, the vicar-apostolic of Chili. On his return, he became domestic prelate of Leo XII., and President of the Ospizio of San Michele; and in 1829 he was named Archbishop of Spoleto, whence he was translated to Imola. He was soon afterwards sent to Naples as nuncio; and in 1840 was named cardinal, from which date

he continued to reside in his see. On the death of Gregory XVI. in 1846, Cardinal Mastai Ferretti was elected by acclamation to succeed him; and having learned, by long intercourse with the people of the Legations, the prevalence and the causes of discontent—which had been concealed under the repressive system of Gregory, following the direction of the Austrians, by whom a protectorate was exercised—he entered at once on a course of reforms, by which he hoped to establish the papal government on a popular, but yet on a firm basis. He resolved to extirpate all abuses of administration, financial as well as political, to withdraw as far as possible the restrictions of personal liberty, to secularise in many details the local administration, and to extend the rights of self-government as far as was compatible with the essential institutions of the Roman states. His first step to this end was to grant an amnesty; and this measure, however humane and necessary, had the unfortunate result of drawing together into the Roman states a body of men whom an unhappy experience of foreign exile had embittered against the existing order of things, and who had served in foreign revolutions, and, in the secret councils which their position had necessitated, an apprenticeship to the arts of political intrigue. For a time, the reforming policy of P. carried with it the affections of the people; but he soon began to fall short of the expectations which he had created. The outbreak of the revolution of February 1848 precipitated the crisis of popular excitement and of popular discontent. Reform assumed the shape of revolution. In November of that year, Count Rossi, whom the pope had appointed as his minister, was assassinated; and violent demonstrations were daily employed to compel the pope's assent to measures which he repudiated. He was driven to confine himself a close prisoner in the Quirinal; and at length, in December, he fled secretly from Rome and established himself at Gaeta, a Neapolitan seaport, not far beyond the Roman frontier. A republic was proclaimed in Rome, the provisional heads of which proceeded to a complete and radical remodelling of the civil government of the state. P. from his exile addressed a remonstrance to the various sovereigns. In April 1849, a French expedition was sent to Civita Vecchia, which eventually advanced upon Rome, and after a siege of about 30 days took possession of that city, and established a French army of occupation within the Roman state. The pope's government was re-established, but he himself did not return till 1850, when, once again, he entered upon the administration, but in consequence of the unsettled condition of Italy and the failure of many of his early measures of improvement, he declared himself unable to proceed with the reformations which he had contemplated. By the help of the French army his authority was maintained without much interruption; but the discontent with the government continued, until in 1860 a rebellion broke out in the Legations, and nearly all the papal territory occupied by the Sardinian troops. Rome, Civita Vecchia, and a few outlying districts were, however, held by the Pontifical and French armies until the breaking out of the Franco-Prussian war, when, the French troops being withdrawn, the remainder of the territory, was annexed to the kingdom of Italy. P.'s ecclesiastical administration was very active, and he proceeded upon the strongest assumption of the right of independent action on the part of the church. In this view he re-established the hierarchy in England, he sanctioned the establishment in Ireland of a Catholic university, and condemned the principles upon which the Queen's Colleges in that country were constituted. He concluded with Austria a concordat, afterward abrogated.

much more favourable to church authority than the existing ecclesiastical laws had permitted. In 1854, he issued a decree propounding as a doctrine of the church the faith of the Immaculate Conception of the Blessed Virgin Mary (q. v.).
